The Edison Lamp Works of the General Electric Co., Harrison, N. J., will make a general exhibit of Edison Mazda automobile lamps of the most popular types and sizes and a representative display of the company's advertising material prepared for and furnished to the dealers for their use. C. M. Bunnell, manager of the Miniature Lamp Department of the Edison Lamp Works, and his assistant, C. P. Metzger, will be in charge of the exhibit.

Digitized by Google

The K-W Ignition Co., Cleveland, will be represented by C. Albracht, general manager, and A. Edmund Hanson of the sales department. The exhibit will include accessories such as the K-W autolock for the Ford car, K-W Ford coil units, K-W Fordson tractor units, contact points of Tungsten and the new Sparkite contact for the K-W Ford coil.

Victor Gaskets.

The Victor Manufacturing & Gasket Co., Chicago, will display gaskets known as the Victor super-quality copper asbestos cylinder head gaskets and other types, such as manifold, exhaust, closed, French, lug, etc. The display will be unique, as it will be the only one of its kind represented. A. C. Delson, sales and advertising manager, will be in charge.

The Van Briggle Motor Device Co., Indianapolis, has planned a display to show advance in efficiency, emphasize that simplicity is the keynote of progress and finally to impress upon the trade the effective simplicity of the Van Briggle carburetors and shock absorbers. The "P" line of carburetors, with the airplane principle, will be a feature. These "P" line carburetors are built in special models for the Dodge, Maxwell and Ford, and will be displayed and exhibited in an interesting, non-technical way.

The Metal Stamping Co., Long Island City, N. Y., will display the Lyon tire holder for Ford cars, the New "Eazy" bolt clipper, the "Handy" bolt clipper, Leakproof auto curtain lights, the Lyon resilient bumper and others of its products.

The Hall-Thompson Co., Hartford, Conn., will be represented by H. C. Thompson and T. A. Morel, and will have a complete line of its Wonder-Worker chemical automobile specialties.

Chas. O. Tingley & Co., Rahway, N. J., will display the C. O. T. automobile and cycle tire accessories.

Spring Bumpers.

The New Era Spring & Specialty Co., Grand Rapids, Mich., will exhibit New Era "Better" Spring Bumpers of double bar construction, with detachable arms, thus allowing free exchange of arms so the dealer or jobber need not carry any dead bumper stock. The company will introduce a new zinc nickel finish, which it claims is positively rust proof and immersed in rubberized transparent lacquer. The exhibit will also include a complete line of modern, quick operating, thief-proof and strapless tire carriers for every Ford need, also its "Instant" tire carrier for all makes of cars. Various styles of New Era "Better" springs will be shown and demonstrated on a machine that will straighten out flat the spring 3000 times, or over 20,000 times each day. New Era foot accelerators and the Moto Nose will be demonstrated.

The Splitdorf Electrical Co., Newark, N. J., will exhibit the following Splitdorf products: High-tension magnetos, green jacket spark plugs, peened piston rings, cable, electrical measuring instruments, high-tension magneto system for Ford cars, high-tension magneto system for Fordson tractors and the Master electrical primer.

The J. & B. Manufacturing Co., Pittsfield, Mass., will display its electrical and ignition specialties. The Bonney Vise and Tool Works, Inc., Allentown, Pa., will show its open end wrenches and other tools of the automotive nature. The Durkee-Atwood Co., Minneapolis, will have its complete line of Rie Nie products, featuring its fan belt, shellac, liquid radiator cement, auto patches, enamels and dressings.

The Howe Lamp & Manufacturing Co., Chicago, will have space number six, where it will exhibit the following Howe products: Searchlights, safety tail lamps, electric tail lamps, timer for Ford cars, fans for Ford cars.

Business Never Better Say All the Jobbers

There is good reason why everyone will be smiling happily at the big show of the Automobile Equipment Association in Chicago.

Business is splendid—it was never better.

And indications are that it will remain splendid for a mighty long time to come.

The manufacturers of automotive equipment and accessories report that they are simply overrun with orders.

They are having a hard time trying to catch up, but thus far they have not been able to keep pace with the flood of orders.

The jobber is happy, and so is the dealer.

Everyone appears to be perfectly satisfied.

The Dole Valve Co., Chicago, will display its full line of Dole double compression couplings, shut-off cocks and priming cups.

Air Compressors.

The Mayo-Skinner Manufacturing Co., Chicago, will exhibit five styles of hand tire pumps, three styles of hand grease guns and grease pumps, seven styles of stationary and portable compressors and two styles of oil can holders. Some of the air compressor outfits are too large for exhibit in the small space allotted to the company, but the essential parts will be there for inspection. More care and attention is being given this display than any previous one. Three of the items will be entirely new.

The Gemco Manufacturing Co., Milwaukee, will show practically its entire line, including the spring channel number and the full spring bumper. The Weaver Manufacturing Co., Springfield, Ill., will have spaces 108 and 109, where there will be a complete line of Weaver garage equipment. New items of Weaver equipment will be shown for the first time. Salesmen from the company's various territories, except the Pacific coast, will be present.

The National Standard Co., Niles, Mich., will exhibit its complete line of jacks and air compressors. A new line of truck jacks will be shown for the first time. The company is bringing out in small sizes a new feature of the ball bearing, encased, making the jacks unusually easy to operate. On some of the larger sizes will be shown the ratchet and geared type, the gears reducing the friction and making the jacks very easy of action. There will be some new features in the automobile jack line.

The Double Fabric Tire Co., Auburn, Ind., will occupy booths 28 and 29. The sales manager, C. L. Stebbens, with F. D. Higgins and Sam G. Biddle, will be on hand throughout the week, together with other representatives of the company, who will be there from time to time. The display will be devoted entirely to tire reinforcements, with the inside blowout patches, reliners and interlock and outer boots. Headquarters will be at the Congress Hotel.

The Motor Parts Co., Philadelphia, will exhibit at booth 81, main floor, three productions, which will be shown for the first time at any association exhibit. These are the "MP" cables, Pedrick piston rings and "MP" spark plugs. Large attractive display boards will give convincing arguments to the jobbers. The spark plug is brand new, the very first models being shown. The sales department will be represented by F. W. Wilkening and F. I. Fealy, both of Philadelphia; G. V. Swendeman, Atlanta, and A. C. Altree, San Francisco, and the engineering department by E. F. Dickieson.

The Heiser Special Tool Co., Kingston, Mo., will exhibit the Heiser improved cylinder reboring machine for Ford motors in space 140. The Bonney Vise & Tool Works, Allentown, Pa., will display vises and wrenches of all kinds.

Shaler Exhibit.

The C. A. Shaler Co., Waupun, Wis., will exhibit a complete line of tire vulcanizers. The new V type Shaler Roadlighter will be shown. Regarding the Roadlighter, the company states: "This is a radical departure from the usual dimming lens in that while it has passed highest in every official test required for the efficiency of dimming devices, it also has no superior as an illumination device and gives a driving light far superior to that obtained by the use of clear glass."

The Champion Ignition Co., Flint, Mich., will display AC spark plugs and AC magnetic speedometers. The company will be represented by Albert Champion, W. S. Isherwood and E. S. Cummings. The company's space is No. 137 and headquarters will be in rooms 1170-72 at the Congress Hotel.

The Goodrich-Lenhart Manufacturing Co., Hamburg, Pa., will exhibit practically all of its products, with one or two new articles. The new Goodrich coil lock will be shown for the first time. This lock has been designed to take the place of the popular ignition type of lock for the Ford car. The new type of Ford car, having the self-starter attachment, is so constructed that the old popular type of ignition lock cannot be used on it, whereas the new Goodrich lock, the maker announces, has just secured the approval of the Underwriters as suitable for the new car, as well as for the old type. This article is sold in a complete

Digitized by Google

unit and entails no expense in attaching.

The A. Nelson Manufacturing Co., Chicago, maker of automobile parts and equipment, will have an interesting display.

Arrow Grip Devices.

The Arrow Grip Manufacturing Co., Glens Falls, N. Y., will display the Arrow Grip lifting jack for use in connection with passenger vehicles and also a complete exhibit of the Arrow Grip traction and non-skid device. The Van Sicklen Speedometer Co., Elgin, Ill., will have a complete line of Van Sicklen-Elgin speedometers for installation on Ford cars. An instrument made especially for the late Ford models, having an instrument board and starter installed on same, will be featured. The company announces that many Ford dealers have experienced trouble in installing speedometers on these cowl boards owing to same being covered with a heavy steel plate. Therefore, a special tool, which is economical and is made for quick and neat cutting of these holes, will be demonstrated.

The Peters & Herron Co., Columbus, O., will exhibit a full line of tire covers, radiator and hood covers, seat covers and top coverings for automobiles. The Anderson Electric Specialty Co., Chicago, will have a somewhat extensive display, but will specialize on the "Autoreelite" and the "Reelite." The model B "Autoreelite" represents an advance in automobile searchlight construction, combined with the exclusive Anderson patented "Reel-feature." The "Reelite" is a new portable lamp for use around garages and machine shops.

The Sunderland Manufacturing Co., Chicago, will show its line of Red Band tire pumps and, in the way of new articles, will have a new high class, single action pump and two new grease guns, which, the company announces, will be of entirely different construction from anything now on the market.

The L. P. Halladay Co., Streator, Ill., will show its complete line of bumpers, shock absorbers, tire holders, suit case carriers, can tippers and carbon tippers.

The Badger Manufacturing Corporation, Milwaukee, will show its complete line of bumpers, tire carriers, steering wheels, etc. The company has two brand new items in the bumper line which are expected to attract a great deal of attention. One of these, the company announces, is the biggest improvement brought out this year.

Walden-Worcester Display.

Walden-Worcester, Inc, Worcester, Mass, will have a general display of its line, and will be represented at the show by 12 members of the sales organization. The company's Chicago office is at 452 Monadnock building, and the representative will be registered at the LaSalle Hotel.

The Western Manufacturing Co., Oskaloosa, Ia., will have space 79 and will exhibit a full line of Eco air and water stations, engine stands and service stands. A special feature will be the first exhibition of the new Eco Universal Motor Handling Machine, which the company believes will be of special interest to the jobbers and dealers.

The Champion Spark Plug Co., Toledo, O., will have a general display of advertising and dealer helps for the benefit of the jobbers and retailers. The entire line of the company's spark plugs will be shown, together with the Champion "Minute" spark plug cleaner.

Albertson & Co., Sioux City, Ia., its complete line of Sioux tools designed to simplify the difficult and tedious automobile repairs.

Motor Specialties.

The Motor Specialties Co., Waltham, Mass., in addition to showing its complete line, will have one or two new specialties. The first of the special features will be the Beamolite, which is a windshield spotlight. All metal parts will be made of composition bronze, heavily nickeled, so that they will be rust proof. The instrument will be guaranteed to remain in any position regardless of the vibration of the car. It can be swung to any position, even backwards. The handle itself forms the switch. The other new offering is the New Front Apron for Ford cars. This device, the company states, changes the appearance of the Ford car, from the radiator down, making it look like a higher priced vehicle. It is shaped in such a way, it is said, that it induces a greater volume of air to pass through the radiator and prevents overheating of the motor. The list price is $6.50 east of the Mississippi and $7.50 west. Five salesmen will be at the show.

NEW M. A. M. A. MEMBERS.

At a meeting of the board of directors of the Motor and Accessory Manufacturers' Association at the New York offices the following companies were elected to membership:

American Hammered Piston Ring Co., Baltimore, Md.; Chicago Steel Wheel Co., Chicago; Corcoran Manufacturing Co., The, Cincinnati, O.; Iron City Products Co., Pittsburgh; Lawrence & Co., L., New York; National Clutch Co., Inc., Irvington-on-Hudson, N. Y.; Roberts Brass Manufacturing Co., Detroit; Schutte Body Co., Chas., Lancaster, Pa.; Sears-Cross Co., Brooklyn, N. Y.; Special Tool Engineering Co., Dayton, O.; Trexler Co., The, Philadelphia; Wellman, Seaver, Morgan Co., Akron, O.

Among other firms elected within the past two months are the following:

General Asbestos & Rubber Co., Charleston, S. C.; Hudson Motor Specialties Co., Philadelphia; McQuay-Norris Manufacturing Co., St. Louis, Mo.; Macbeth-Evans Glass Co., Pittsburgh; Midwest Engine Co., Indianapolis, Ind.; Northwestern Chemical Co., Marietta, O.; Perfection Heater & Manufacturing Co., Cleveland, O.; Story Rubber Co., New York; Toledo Steel Castings Co., Toledo, O.; Triplex Safety Glass Corporation of America, New York.

SCHRADER CASE DECISION RELATIVE TO PRICE FIXING.

A decision of importance to manufacturers of widely advertised products, with relation to the right of a manufacturer to fix the resale prices of his products, has just been handed down by Judge Westenhaver of the U. S. District Court of Ohio in the case of A. Schrader's Son, Inc., whom the Federal grand jury had indicted on the ground of certain contracts made by A. Schrader's Son, Inc., with the tire maker and jobber for the handling of its goods, which contracts fixed the prices at which the tire maker might sell to the jobber, retailer and consumer and the jobber might sell to the retailer and consumer.

A demurrer to this indictment was filed by A. Schrader's Son, Inc., which demurrer was recently reargued before Judge Westenhaver.

The government contended that the entering into of these contracts was an offense against the Sherman anti-trust law, and that the case was not controlled by the decision of the Supreme Court in the Colgate case, which held that a manufacturer could choose his own customers and announce in advance that it would deal only with such customers as maintained the prices fixed by the Colgate company.

The contention of the Schrader company was that there was no essential difference between its selling plan and that of the Colgate company, and that the mere fact that it announced its prices in a written license agreement which was signed by the tire makers and jobbers did not bring the case within the Sherman act.

The decision of Judge Westenhaver was in effect that the charges in the Schrader company indictment did not constitute a crime under the Sherman anti-trust act, and the indictment was accordingly dismissed.

The court refers to the fact that under the decisions in the Colgate case the manufacturer has the right to absolutely refuse to deal with anyone who does not maintain the prices indicated by him, and that the effect of this may be in some cases even to put the dealer out of business.

The Schrader company is engaged in the manufacture of tire valves, valve parts, tire pressure gauges and other accessories related to tires and marketed quantities of such devices through tire makers acting as wholesalers and through jobbers. Such goods are patented, but from the opinion of Judge Westerhaver it would appear that his decision would have been the same if the goods had not been patented.

It is apparent under this decision that if the Schrader company licensees do not observe the prices fixed, the Schrader company would be well within its rights to refuse to sell them any further products.

ASK WAR DEPARTMENT TO SELL SURPLUS AUTOMOBILES.

Republican House leaders at Washington have decided to abandon legislation authorizing the free distribution of army trucks and other motor equipment among the states for road building and have substituted a resolution requesting the War Department to sell this equipment, along with passenger automobiles, as soon as possible.

Digitized by Google

Spicer Buys Parish and Sheldon Companies

The Spicer Manufacturing Corporation, a Virginia company, which is the largest manufacturer of universal joints and shafts for automobiles in the United States, has purchased the Parish Manufacturing Corporation and the Sheldon Axle and Spring Co. The Parish company, which has plants at Reading, Pa., and Detroit, Mich., is one of the largest manufacturers of frames for automobiles and trucks in the country and the Sheldon Axle and Spring Co. is the second largest manufacturer of axles. The acquisition of these two properties makes the Spicer corporation one of the most important factors in the automobile industry.

CONVENTION OF SERVICE MANAGERS NEXT MONTH.

The Service Managers' Convention will be held in the Hotel Statler, Detroit, Nov. 10, 11 and 12. General service policies will be discussed at the opening session and factory service organization in the afternoon. The morning session of the second day will be devoted to a discussion of service relations between factory and dealers and the afternoon meeting to the relations between distributors or dealers and customers. On the third day there will be excursions to factories.

SELLS KNOX PLANT.

The plant of the Knox Motors Co., Springfield, Mass., has been sold to Neil R. Sinclair of New York, president of the Militor Motors Corporation. The Knox company reserves the right to use a part of the building for its needs for a period of two years. The Knox company has been identified with the motor industry since its infancy and will continue the manufacture of its present products, as well as parts for its former models, at the Springfield plant. It is understood the company is considering plans for expansion.

NEW FIRESTONE RIM PLANT.

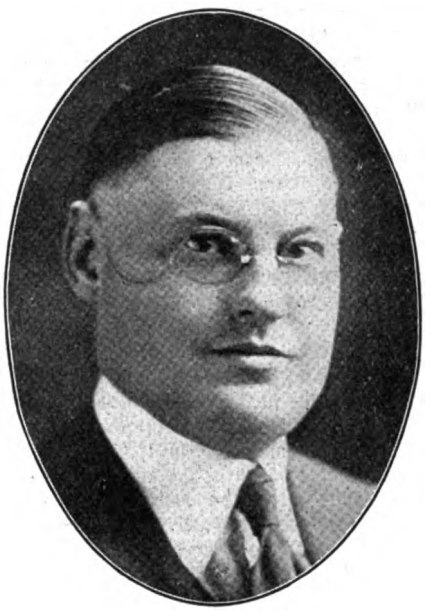
Work has been started on a new $1,000,000 plant in the group of Firestone factories at Akron, O. The new plant will house the Firestone Steel Products Co., which annually makes approximately 1,250,000 demountable rims for pneumatic automobile tires and 65 per cent. of the steel bases used in the United States for solid truck tires.

MUST CHANGE NAME.

Finding that the similarity in the trade names, "Universal Battery Service Co.," adopted by James B. Shafer, Chicago, dealing in automobile storage batteries, and "Universal Battery Co., the name of a previously established Illinois corporation, has caused confusion among purchasers and has deceived and misled the general public, the Federal Trade Commission has ordered Shafer to discontinue use of the word "universal" in connection with the manufacture or sale of storage batteries.

NEVILLE NAMED SALES MANAGER FOR HINKLEY MOTORS.

The appointment of Charles A. Neville as sales manager of the Hinkley Motors



CHARLES A. NEVILLE.

Corporation is announced by President C. C. Hinkley. Mr. Neville joined the Hinkley staff soon after the organization of the company. His promotion is the result of successful result getting effort in the sales department, of which he has now become the head.

BEARINGS MERGER.

A new $10,000,000 Delaware company, the Standard Steel and Bearings, Inc., will combine all the Marlin-Rockwell factories into one big operating concern. The plants to be merged are: Standard Roller Bearing Co., Philadelphia; Braeburn Steel Co., Pittsburgh; Rockwell-Drake Bearings Division, Plainville; Willow Street and Hamden Divisions, New Haven and Norwich Division. Several sales offices are to be centralized ultimately in New York.

Announcement has been made that the executive offices will be at 347 Madison avenue, New York.

STANDARD BRANCH IN NEW YORK.

The Standard Steel Car Co., Pittsburgh, manufacturer of the Standard Eight, has purchased the interest of the Taylor Motors Corporation, 1920 Broadway, New York, and will open there a direct factory branch. E. C. Johnson, vice president of the old company, who since his return from overseas service has had the management of the old business, has been appointed general manager of the new branch.

Fordson Tractors to Be Sold Direct to Dealers

Fordson tractors will be sold direct to the dealer after Aug. 1, 1920, when the present plan of handling them through authorized distributors will be discontinued. The change conforms to the policy of some tractor makers in eliminating the distributors in favor of the branch house plan of distribution. It is expected that selling costs will be reduced. When Henry Ford & Son began the sale of the Fordson last year Ford car dealers were in most instances given preference when distributors were appointed. However, some organizations that did not deal in cars were given rich territory.

HASKELL ASSISTANT GENERAL SALES MANAGER FOR GRANT.

The Grant Motor Car Corporation, Cleveland, announces that J. A. Haskell, formerly of Chicago and Des Moines, who has been connected with the Grant sales department, has been made assistant general sales manager by George S. Waite, general sales manager. Before joining the Grant organization Mr. Haskell was assistant branch manager for the Studebaker Corporation in Chicago and later branch manager for the same organization in Des Moines. Mr. Haskell will devote his energies to detail and field work in the powerful sales and service organization established by Mr. Waite. The new Grant Six is in the hands of dealers in all parts of the country. The 1920 car has an entirely new hood and long, low lines, and, as compared with its predecessor, has a longer wheelbase, a wider power range, greater flexibility and a more artistic appearance.

BEGGAR MUST SELL CAR.

Michael Stark, 23 years old, was ordered by a Brooklyn, N. Y., police court to sell the automobile he had bought with his "earnings" as a street beggar and donate the proceeds of the sale to the Red Cross.

BLACK & DECKER MOVES.

General offices of the Black & Decker Manufacturing Co. have been moved from 105 South Calvert street, Baltimore, Md., to Towson Heights, Baltimore.

STUDEBAKER CAPITAL INCREASE.

The Studebaker Corporation plans to increase its capital from $30,000,000 to $75,000,000. It is planned to issue $15,000,000 immediately.

GARAGES FOR SCHOOLS.

It is no longer unusual to see garages being built at the rear of high schools, as well as private schools, for the cars of scholars who drive to school.

National Shows to Break Record

EVERY indication is that the national automobile shows, to be held in New York and Chicago under the auspices of the National Automobile Chamber of Commerce, will be the greatest ever held. A record list of exhibitors is already assured. There will be at least 87 different makes of passenger cars and 60 makes of trucks. The display of accessories will be the biggest ever. At least a dozen makes of new cars will be shown for the first time.

The New York show will be held during the week of Jan. 3 to 10. Grand Central Palace will house the exhibits of passenger cars and accessories. Motor trucks and sundries will be shown in the Eighth Coast Artillery Armory, Kingsbridge road and 194th street. A big transportation conference will be held in the armory in connection with the show. The Chicago show will be held Jan. 24-31.

The following makes of passenger cars will be exhibited at both the New York and Chicago shows:

Allen, Amalgamated, American Beauty, Anderson, Apperson, Auburn, Biddle, Briscoe, Buick, Cadillac, Case, Chalmers, Chandler, Cole, Chevrolet, Cleveland, Columbia, Comet, Commonwealth, Crow-Elkhart, Davis, Detroit Electric, Dixie Flyer, Dodge Bros., Dorris, Dort, Elcar, Elgin, Essex, Fiat, Franklin, Grant, Haynes, Hollier, Holmes, Hudson, Hupmobile, Jackson, Jordan, King, Kissel Kar, Leach, Lexington, Liberty, McFarlan, Maibohm, Marmon, Maxwell, Mercer, Milburn Electric, Mitchell, Moline-Knight, Monitor, Moon, Nash, National, Oakland, Oldsmobile, Olympian, Overland, Owen-Magnetic, Packard, Paige, Paterson, Peerless, Pierce-Arrow, Premier, Reo, Roamer, Saxon, Sayers, Scripps-Booth, Standard, Stanley, Stearns-Knight, Stephens Six, Stevens-Duryea, Studebaker, Stutz, Templar, Velie, Westcott, Willys-Knight and Winton.

The Kline Kar will be exhibited at New York only, while the Pilot and Monroe will exhibit at Chicago only.

N. A. C. C. BANQUET.

The grand ball room of the Commodore Hotel in New York has been engaged for the annual banquet of the National Automobile Chamber of Commerce to be held on Tuesday evening, Jan. 6, which is during the New York Automobile Show.

Besides the one speaker which it is customary to have at N. A. C. C. affairs, there will be a presentation of awards to individuals who have rendered important service to the industry during the past 12 months and an original play on timely topics in the industry written and staged by Fred E. Dayton, vice president of the Ajax Rubber Co., and Henry Caldwell, automobile editor of the New York Herald.

With the additional accommodations that the ball room provides, it will be possible to care for a number of men in the industry aside from the motor car and motor truck makers who are members of the N. A. C. C. Balcony seats will be provided for ladies who wish to attend.

IMPLEMENT MEN URGED TO SELL CARS AND TRUCKS.

The National Federation of Retail Implement and Vehicle Dealers' Associations, at the national convention in Chicago, adopted resolutions protesting the sale of especially built power farm equipment to tractor dealers who are not connected with the regular implement trade. It was resolved that the business of the retail implement dealer will fail unless he takes on the tractor, the passenger car and the motor truck, and that tractor makers should not crowd tractor agencies in too closely.

NATIONAL AUTO CHAMBER GETS THREE NEW MEMBERS.

The Daniels Motor Car Co., Reading, Pa.; the William Small Co., Indianapolis, maker of the Monroe, and the Templar Motors Corporation, Cleveland, have been elected members of the National Automobile Chamber of Commerce, making the total membership 120.

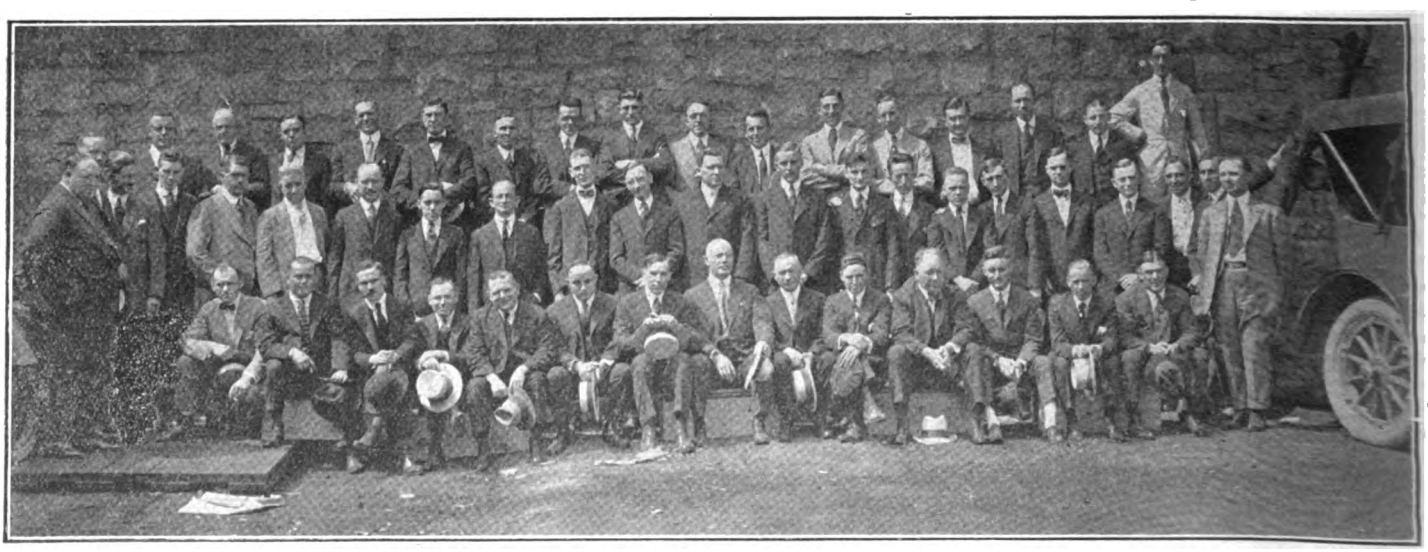
NEW STERLING BUILDING.

Visitors at the Automotive Equipment Association exhibition will see a large photograph of the new factory building of the Sterling Manufacturing Co., Cleveland, O. This building was made necessary by greatly increased business. It is three stories high, 65x100 feet. The building will be devoted to the manufacture of the company's small instruments. Business has been developed not only throughout North America, but in all parts of the world. The new structure is on Prospect avenue, in the heart of the new automotive section of Cleveland. A three-story office building is planned.

At the Chicago show the company will show, in addition to its regular line of pocket and dash ammeters, special instruments made for the Ford Motor Co., Buick Motor Co., F. B. Stearns Co. and the John O. Heinze Co.

The company has made arrangements to make the exhibit educational, as well as interesting.

Gill Branch Managers Attend Convention in Chicago



The Accompanying Photograph Shows a Group of Branch Managers Who Attended the Recent Convention of the Gill Manufacturing Co. in Chicago. The Company Has Branches in Practically All Important Cities from Coast to Coast, and More Than 50 of Its Representatives Attended.

How the Service Station Should Be Operated

Willys-Overland Co. Outlines the Fundamental Principles for Organization and Underlying Policies--Suitable for Any Size Establishment.

THE following has been prepared by the Willys-Overland Co. for the benefit of those who conduct its sales and service stations in various cities throughout the country:

What is service? In the entire automobile dictionary there is no more abused, misused and misunderstood word than "service." By some car owners it has been interpreted to mean free adjustments, free repairs and even parts without cost. For the dealer it often means a large overhead expense on which there is little or no direct financial return.

Yet no single factor of a dealer's business can be made to contribute as much toward his reputation and success as the proper administration of this most vital department, besides being made to add to the profit side of his ledger.

No matter how good a car the dealer sells today, if the buyer does not receive the value he anticipates — within the bounds of reason, of course—he will not consider another car of the same make when next he is in the market for an automobile. It is in a great measure up to the dealer's service department to assist the customer to get maximum efficiency out of his car at minimum expense.

But this does not necessarily involve the giving of something for nothing. On the contrary, the dealer only weakens his reputation when he gives something to which the owner is not justly entitled. He will create more respect for himself through businesslike, though firm methods, than through liberal, but loose dealings. There are times when a dealer may desire to make a policy adjustment, which may consist of free labor or parts, but the facts of the case should always warrant such action, and should be so explained to the customer.

Never lose sight of the fact that the service department, like the sales department, has something to sell and fully as much care should be devoted to the proper disposal of its goods as is used in the selling of automobiles.

The policy underlying the operation of a service department has never been as clearly defined as it should be. In consequence every dealer has his own method of taking care of this end of his business.

Our idea as to a proper service policy, evolved not only from our actual experience with service problems, but also from the experience of hundreds of our distributors and dealers, is:

First, the car should be thoroughly inspected before delivery to make sure that everything is in the best of order and complete as to equipment.

Second, the purchaser should be carefully instructed as to operation and maintenance of his car.

Third, there should be available a well assorted supply of repair parts.

Fourth, courteous and prompt attention should be given to every customer and capable mechanical attention should always be available, when required, for a proper remuneration.

We believe that this is the kind of service every dealer should aim to have available for his customers and that adherence to such a policy will insure complete and lasting satisfaction to every owner.

Service Organization.

It is impossible to lay down a hard and fast system covering the operation of a service department, as each dealer has to be guided entirely by the volume of his business and by local conditions. But in the following pages of this section we have endeavored to mention some principles of successful service, both from the owners' and dealers' viewpoints.

This does not imply that we expect every dealer to do all that we recommend here. Some dealers' business does not warrant such extensive establishments as we make reference to. But we outline the fundamental principles of a service organization and its underlying policies. These, we feel, can be readily adapted to a one-man garage, yet are so flexible that they can be used with greatest satisfaction by the largest Willys-Overland distributors and dealers. Although we have specified the duties and responsibilities of several positions, these can be allotted to one, two, four or as many men as the size of the business warrants.

Service Manager.

Duties and responsibilities. The head of the service department should have charge of all work in connection with its management and direction. This should include loading and unloading of new cars and their necessary conditioning and delivery to customers, wholesale and retail. Some dealers have also found it advisable to make the service manager

responsible for all repairs and adjustments necessary in the conditioning of used cars for delivery, except the final adjustments usually done under the direction of the used car department.

His other responsibilities should be supervising all repairs and adjustments on customer's cars; responsibility for building maintenance; care and upkeep of company's car equipment, including demonstrators and service cars; care and conditioning of new and used car stock.

In the final analysis the service manager should be responsible for the employment, discipline and proper direction of all employees under his supervision, and is to see that they are familiar with the duties assigned them and have proper knowledge of the various forms that they use and come in contact with.

Guarantee and policy. All questions of guarantee and policy should be submitted to the service manager for interpretation and settlement, as well as all work done over, free of charge to the owner. The latitude of these decisions is regulated by the management. The interpretation of guarantee and policy should be watched with care as these are sources of expense which reflect greatly on the ability of the service manager. Hold strictly to the wording and spirit of the Willys-Overland warranty. It is at times, however, a matter of judgment in individual cases. In passing on a case have all the facts before you, particularly date of sale, mileage and all other circumstances that may influence the decision. Policy is a matter that should be handled with utmost care to avoid expense and each case should be treated individually, considering all facts as in the case of the warranty. Matters of policy, involving expense, should always be referred to the proper authority.

Complaints. The subject of properly handling complaints is of greatest importance to the service department. Never assume that the customer is wrong in his contention, but analyze the case thoroughly and try to convince him of the facts of the case, if you feel certain that you are right. On the other hand, should there be an element of doubt, the customer should be given the benefit of it.

If a case is decided in favor of the customer, it should not be done in such a manner that the customer receives the impression that he is receiving something for nothing; he should be told that what he gets he is entitled to by the merits of the case.

Courtesy costs nothing, yet the lack of it is expensive to any organization. Do not tolerate any individual discourteous attitude on the part of subordinates who come in contact with customers.

Prompt and personal contact with customers in settling complaints is of great value. Lengthy correspondence is to be avoided.

Order Taker or Service Salesman.

Duties and responsibilities. There is no position in the entire service department quite as important as this task as nearly all the service complaints that the dealer will experience can be traced back to the taking of the owner's order. Either the owner's word for the difficulty may have been taken and the repair made that he specified, when something else was at fault; or else, the owner's directions may not have been specific enough and much work done that was not called for; or, as has often happened, an attempt has been made to correct imaginary troubles in the motor car, merely because the owner thought his car was not running properly, no doubt due to improper driving methods. And there are the many instances when the owner drove into the service station and wanted his motor torn down, when all that was required was regrinding of valves, removing of carbon from the cylinders, or some comparatively slight repair or adjustment.

All customers should be waited upon promptly, courteously and in turn as they enter the service station. The order taker must appreciate the value of a customer and his good will in the expansion of the dealer's business.

The order taker should be competent to discuss with a customer the troubles which he has with his car, or if he is not, there should be a competent tester to diagnose the complaint.

If the trouble has to be located it is well to have the customer go out on the road with the order taker or tester, as in this way an intelligent order can be written up to correct trouble complained of. Very often a small adjustment or instructions that can be given to a customer on such a road inspection will correct the trouble, whether real or imaginary.

It is therefore necessary that the best mechanical skill available should be employed in diagnosing troubles. Care should be taken in filling such positions to see that men are in every way qualified to make correct diagnoses, as inaccuracy in this respect means needless expense to the owner and dealer.

Caution and tact are required in diagnosing as the impression of the customer as to the source of his mechanical troubles is not always correct, and it will be often necessary to point out to a customer with great tact the actual facts in the case. It may even be advisable to request the owner to drive his own car in order to be sure that what he considers the trouble may not be due to the way in which he drives or handles his own car.

How to Write an Order Properly.

An order should be written up clearly and distinctly. The first important step is to get the customer's name, address and telephone number correctly. If he does not have a telephone, arrange with him so as to be able to get in touch with him in event that you require additional instructions in the process of the repair job.

The next step is to indicate model, serial number, mileage and date of sale, as this information will be of value in deciding questions of policy and guarantee. All questions of guarantee, policy, work done over, or other circumstances which involve the dealer's responsibility, should be settled with a customer before work is started. Exceptions, of course, are in order when the conditions complained of are subject to shop inspection upon disassembly of parts. Such conditions must be plainly indicated in the repair order.

Above all things when repair order is written up it should be signed by the customer or confirmed in writing.

When the customer's order has been written up, if he is not satisfied with the decision or with the explanation of the order taker concerning warranty, policy, etc., the order taker should refer him to the service manager for settlement.

Repair items should be grouped under proper headings, such as motor, clutch, steering, brakes, rear end, etc., to facilitate handling in the repair shop.

Paint and trim work should be grouped separately.

In writing up electrical work care should be used to state whether trouble is in ignition, starting motor, generator or lighting circuits. Common errors are made in writing up an order such as "take knock out of motor" or "repair electrical systems." It can be seen that a broad order of this kind can run up expense without limit, as the first may involve tearing down the entire motor, and the second overhauling of the entire electrical system.

Hence, when a proper test, whether road or floor, is necessary to determine condition, it is well in cases involving expense of this kind, to dismantle the motor in the shop, sufficiently to make an inspection. After such an inspection a report can be made to the customer in order to secure instructions as to whether he wants a thorough overhauling of the entire motor, or just a light overhauling, such as tightening up bearings, putting in wristpins, etc., for further service. Service salesmanship enters largely into the question here, for the customer's order and the satisfaction he is going to experience with the completed job, are going to depend on the way repairs are sold to him.

When recommending repairs, bear in mind that you should endeavor to save the customer all possible expense. Don't induce him to go into extensive repairs when they can be avoided. Always consider his interests as though you were spending your own money. While this comment has referred only to the motor, the same policy should apply to any part of the car where repairs are involved.

Additional orders to original should be discussed with customers with utmost

Fig. 3-A

care and proper authority obtained to go ahead with additional work.

Estimates. After an order is taken clearly and specifically the next important step is the matter of price. A customer should be quoted a price before work is started, as this will avoid controversy when the bill is presented.

Care should be taken to avoid the necessity for additional orders, except when a customer is quoted a "lead" price for dismantling the car or parts to see the extent of repairs that will be necessary. So that no criticism shall be aroused from the customer by additional orders, order taking should be as complete as possible in the first instance.

Delivery promises. When promises are given to a customer they should be lived up to. Do not promise the impossible nor take a chance on the completion of the job. If you find that a promise cannot be kept, due to unforeseen circumstances, notify the customer in advance. It is very bad business to promise delivery at a certain time to a customer and have him find after making a special trip to the service station, that his car is not ready. It is just such instances that bring service stations into ill repute.

Care of customer's equipment and tools. The question of checking the customer's tools and equipment is an important one, as it is very easy for much of this material to be lost while the car is being repaired. Some service stations employ the simple expedient of marking the equipment and tools on the repair order. To hold this equipment it is often satisfactory to lock it up in a suitable locker for this purpose. However, it is not advisable to establish an elaborate system of checking as the losses probably would not always warrant it.

Robes and wearing apparel should be removed before sending the car to the shop, even for small jobs.

When a car is sent to the shop for overhauling it is good practise to make a complete check and remove all owners' equipment and tools. It is important also to note scratches, dents or blemishes, as this avoids controversy with the customer, in case he claims damage had been done while in the service station. By properly checking over a car in this manner much annoyance to the customer and loss to the dealer in making good such claims may be averted.

It is good practise to securely attach shop copy of repair order to the front end of the car in a suitable holder. It is also advisable to attach to the car an identification tag, with customers' name, model number, date received and date completed, which should stay on the car through process of repairs and until delivery. This tag serves to identify the cars awaiting delivery and facilitates

collection of storage charge on cars not called for promptly after completion of repairs.

Shop Foreman.

Duties and responsibilities. The shop foreman should be thoroughly familiar with the routine and handling of various forms that have to do with shop work.

It is important that work tickets, requisitions and shop purchase orders are made out intelligently. The making out of the work tickets should be centralized in the shop as much as practical. When possible a time clock should be used to indicate in and out time of a job.

Operation time should be marked on the work tickets, particularly where warranty or policy, etc., has to be separated for information of the billing clerk or bookkeeper.

The shop foreman should be consulted at all times as to promises on work in process, or work to be sent to the shop when a promise is desired. Much confusion is caused by the service officer or order taker continuing to accept work for the shop when there is already a waiting list. Dissatisfaction among customers is the result of accepting jobs for repairs without explanation as to the possibility of delays, due to the pressure of work already on hand.

Where the volume of work is sufficient to justify such procedure, mechanical work in the shop should be divided and grouped, such as motor, clutch, steering, transmission and differential, electrical, etc. Better results are obtained by arranging the men in gangs or units for the various repair work; in other words, specialize your men, as this makes for better efficiency and more volume. Naturally, this division of labor is also governed by the amount of work handled by the service department.

The shop foreman should see that all work performed under his supervision is done properly, economically and promptly by competent mechanics; he should see that the shop equipment and tools are kept in order and repair; and should make necessary recommendations for improvements from time to time. He should keep in touch with the repair sections of this manual and see that all of his mechanics are familiar with this information.

Shop tools and tool room. Special attention should be given to the tool room and its equipment. A monthly inventory should be taken. All tools loaned out to workmen should be handled on a check system. Tools loaned out during the week should be returned to the tool room on the last day of the week. The tool room of the repair shop is often called "the eye of the shop" and its care and upkeep often tells how a shop is run.

The tool room should be enclosed and locked, with a responsible person in charge. Care should be taken to prevent equipment and tools being removed from customers or company cars without authority, while in the shop.

Keep Shop Clean and In Order.

A clean shop is very essential and an asset to the service department. This can be obtained by prompt disposition of discarded material when removed from cars. Parts taken from cars during repairs should be placed in suitable boxes provided for that purpose. It often happens that material from dismantled cars is placed on the running boards or on the floor, only to be lost and replaced at shop expense.

No shop job can be considered complete and closed until all parts remaining have been removed and properly disposed of. Particular attention should be directed to the return of old parts under guarantee, as losses to the dealer result from failure to do so. Brass, copper, aluminum, etc., should be placed in a suitable box, securely locked and not left indiscriminately around the shop. Scrap, not passed by the part auditor, should be disposed of at the best possible prices.

Disposition of old parts, not under guarantee, removed from customers' cars, should be obtained through the service office. This, of course, does not apply to the average job, but only where extensive repairs have been made.

A daily list of parts not in stock for which repairs on cars are being held up should be sent by the shop foreman to the service office, so that necessary effort can be made to hasten delivery of these parts either from the factory or distributor. A sufficient number of fire extinguishers and boxes of sand should be provided in case of fire. Rags and waste should be kept in metal cans. Workmen's clothes and overalls should be kept in suitable lockers, minimizing danger of fire.

No customer should be allowed to enter the shop. Where it is necessary for a customer to go into the shop, passes should be provided, unless he is accompanied by some authorized employee from the service office.

Chief Clerk of Parts Department.

Duties and responsibilities. The chief clerk of the parts department should be responsible for the preparation of claims

against the factory for defective material and the claim record thereof, interpretation of customer's order when received by mail, the approved orders for parts for stock and the correct pricing of all parts and repair sales.

Parts and accessories are of vital importance in the successful management and conduct of business, both in selling and service.

Customers should be waited on promptly and courteously. Intelligent control and handling of stock is accomplished largely by constant vigilance in keeping the stock inventory cards. Stock rooms should be kept securely locked, properly safeguarded and no unauthorized persons should be allowed in them.

No parts or materials are to be delivered without the proper requisitions or forms, duly signed by authorized employees, and on a cash or credit transaction. Credit is to be established through proper authority. Stock rooms should be kept in good order, with particular attention to their cleanliness. Care should be taken to prevent fire hazards. Particular attention is directed to the shipping and packing rooms. A metal or metal lined box is desirable for storing excelsior used in packing. A sufficient quantity of fire extinguishers should be maintained in the stock rooms.

All speed and attention should be given to the filling of shop requisitions to avoid unnecessary delays in repair or replacement jobs.

In handling returned goods on guarantee material, care should be given to getting the correct information so that intelligent claims can be made out. Intelligent handling of claims on guarantees will have a very important influence in controlling service expense.

Minimum and maximum figures on inventory cards should be watched most carefully and excess current or obsolete parts should be promptly returned to the factory.

Cabinet containing parts inventory cards should be securely locked during all periods other than business hours, so as to prevent access to them by unauthorized persons.

Garage.

Proper grouping of cars. The garage of a service station should be neat, clean and orderly and should be provided with proper fire protection. Cars should be grouped and placed in spaces assigned as far as practical, as follows:

Demonstrating and company cars, service trucks, customers' cars waiting to be sent to the shop for repairs and cars which have been repaired and are awaiting delivery to customers.

How embarrassing to the dealer it is to have a customer call for his car after work on it has been completed and then to be notified that it cannot be located and that several employees are searching for it. This reflects on the management.

Keep aisles clear to avoid accident and damage.

The floormen or car movers, if you employ them, should be responsible for keeping the cars in proper spaces.

A list of all cars on which work has been completed should be kept in the service office with their location.

Releasing repaired cars. The outgoing door of the garage should be properly protected by some one responsible to prevent cars from leaving the building without proper authority. A pass or release system should be in force. In establishing such a system care should be taken to see that responsible employees issue them, and that a list of the person authorized to issue passes be given to the door man.

Passes must be signed by the cashier, releasing deliveries of customers' cars on which repairs have been made.

Special "no work" passes should be issued by the service office on customers' cars that come into the garage for information or small adjustments for which no repair order is issued.

Test and inspection. All cars on which repairs and adjustments have been completed should be properly tested and inspected before being turned over to the customer.

Upon completion of the inspection the tester should O. K. the shop job card attached to the car and sign it. The car should not be returned to the shop for such minor details and adjustments as the tester can perform while testing the car.

Should any further trouble show up in the test that was not covered by the order, or that developed through circumstances for which the dealer's establishment was not at fault, the service manager should be notified so that he can advise the customer and secure additional instructions.

A vital feature in the test before O. K.'ing the car is to see that floor boards, running boards, upholstery, steering wheels, etc., are clean.

No matter how satisfactory the job was that is performed by the repair man the customer is anything but pleased when he receives a car soiled with oil and grease. Some of our dealers also have a very commendable practise of cleaning the motor and washing each car that comes in for repairs before delivery to the customer.

The customer who receives a car in the same muddy and dirty condition that he turned it in may get the impression that the repairs he specified may not have been done; but if he receives a car that has been washed and cleaned, with a spick and span motor, as a rule he will be readier to pay the extra sum for the cleaning, which can be included in the repair charge, than he would be to pay the price for the repair and receive the car covered with the same grime as when he turned it in. While this applies more particularly to cars which come in for heavy repairs, yet such a practise on all

cars that come into the dealers' service station can be pursued with success.

New Cars.

New car receiving, conditioning and delivering. It is of prime importance that close attention be paid to the condition of new cars and to the inspection just before delivery to customers. Many service troubles and much dissatisfaction of owners is traced to lack of proper inspection at the time of delivery.

Upon receiving new cars from the factory they should be checked over carefully for damage or shortage and record made on proper form.

Before being delivered to a customer a new car should be thoroughly inspected, lubricated, water poured into radiator, tank filled with gasoline, battery fully charged, tools and equipment complete, tires properly inflated and the car thoroughly cleaned, washed and polished.

Where the volume of business warrants several cars of the various models should be held ready for short notice delivery; however, advance notice of 24 hours should be received in getting a new car ready for delivery. This takes care of all possible contingencies and will obtain better results from a service standpoint. Of course, it is appreciated that this is not always practical in a sales deal and delivery sometimes has to be made on short notice.

Cars that are held for more than a month should be jacked up off the tires and blocked. Water should be drained from all cars, particularly when they are suspended from the ceiling. This prevents water from seeping into the cylinders and causing "seizing" of pistons. Oil should be injected into the cylinders through petcocks in cylinder heads or through spark plug openings to prevent such trouble. Motors should be turned over by hand at frequent intervals in connection with such lubrication of cylinders.

All closed cars should have camphor preparation put in them to protect the upholstery from moths. Doors and windows of these cars should also be kept closed to keep out dust and dirt. In hanging cars care should be taken to see that they are securely suspended and paper placed under the chassis to catch the grease drips. A thick paper similar to the kind used for roofing is best for this purpose.

All tools should be removed from new cars held for delivery and locked up. The batteries, if wet, should be put on charge. Do not leave batteries in cars that are stored. "Robbing" of new cars to obtain proper repair parts or equipment is to be entirely discouraged unless consent of the proper authority is received.

The service department should be held responsible for all deliveries of new cars to customers and care should be taken that the invoice and shipping order are properly received by the cashier before delivery to the customer. Before the customer accepts his car he should sign the retail sales certificate and an inspection and equipment card showing receipt of complete equipment and tool kit. It is recommended that a responsible man be placed in charge of new car conditioning and delivery, as this is one of the most important features in securing satisfaction for customers.

Service Forms.

To aid Willys-Overland dealers to keep an accurate record of all transactions relating to service, particularly on customers' cars, we have listed a series of forms, which can readily be set up by your local printer. Obviously, all of these forms cannot be adopted by a great many dealers. But there are forms here which a dealer can use as a nucleus for his system, adding to them as the growth of his business or local conditions warrant.

Repair order and invoice. This form, shown in Fig. 1-A, authorizes repairs on customers' or company cars and provides on its reverse side a record of the work done and the material issued. The number of copies required will vary in accordance with the extent of the organization.

Original and customer's copy. These copies sholud be filled in by the person taking the order from the customer. By making a carbon copy the customer will have a copy of the original order which he signs. The blank spaces on the form are self-exaplanatory. As can be seen provision is made for a distinct understanding between the customer and the service department, as the order should show just exactly what repairs the customer desires and what he is to be charged.

In taking the order each item should be numbered thus:

1. Install new flywheel.
2. Install new push rods.
3. Wash car and polish.

The columns on this form, subdivided into parts and labor, are the key to the complete understanding the service department should have with the customer before any of the work is started. For instance, if a new flywheel is to be installed, the customer should be told that he will pay for both parts and labor. If this is the case, place X in the charge column under both "P" and "L." If, however, the customer is to be charged for the labor and the part comes under the guarantee, place an X under "L" in the charge column and write "G," meaning guarantee, under "P" and in the no charge column under "L" as well as under "P."

If the order taker finds the entire question is one of guarantee, requiring further investigation before a decision can be handed down, this should be noted on the repair order. Thus the service department and the customer will thoroughly understand beforehand for what parts and labor the customer is expected to pay.

If the work is done free of charge for a policy reason use the letter "P" in the no charge column; if it is work done over, denote this by the letters "WO."

Customer Signs Order.

After the customer's order is completed he will sign on the signature line and the order taker will give him his copy. The remaining copy can be used either as a shop copy in a smaller service station, or can be copied for further use. In the former instance it is advisable that the shop copy be a hard, strawboard card.

Where only two copies of the repair order are needed the responsibility of entering all necessary work tickets and parts requisitions on the form shown in Fig. 1-B, which is the reverse side of the repair order, devolves on the shop foreman or service manager. As soon as repair job is completed the foreman or service manager sends his copy of the repair order, with complete and itemized information on the back, excepting prices, to the office, where it is checked against the parts requisition.

Prices for all the work are then inserted and totaled and an invoice is made out, which is rendered to the customer upon his arrival for the car. If an estimate has already been submitted to him the invoice can be brief, merely recording "Repairs as Specified" and the amount of the bill. Where no estimate has been rendered prior to the job an itemized statement should be submitted.

Digitized by Google

To save time and to avoid possible argument the repair order can be made out in triplicate when the order is taken and the back of the third copy can be used as an invoice. See Fig. 1-C.

Additional instructions to original order should be written or typed on face of same (properly confirmed) when using only two copies as described before. In larger establishments it is better practise to write up additional instructions on a separate sheet or form which is similar in outline to original, the same repair order number being inserted.

Where Various Copies Go.

Service department, invoice, shop foreman and shop copies. After the order is typed from the original made out by the order taker onto the forms required by these various divisions, omitting estimate should one have been rendered, the first two copies are turned into the service department, where they are given to the repair order clerk.

The shop foreman's copy and the strawboard shop copy go along with the car to the repair shop, where the shop foreman takes his copy, while the hard copy remains in the car, preferably in a celluloid faced holder.

As the work tickets are made out by the shop foreman, his clerk or the mechanic, each operation should be noted just as entered on the repair order, specifying guarantee, policy or work done over, wherever necessary. All work tickets not marked in this manner are charged to the customer. In writing requisitions for material to be secured from the stock room, the requisitions should also be marked in this manner. As the work tickets and requisitions are turned over to the repair order clerk, which should be done as often as possible, he will enter this information on the form shown in Fig. 1-B. The no charge items will be entered and marked "no charge." As each entry is made the bill should be extended in total, so that when the bill is completed the total of the amount column will equal the amount in the total column, thus giving the clerk a check on his figures.

After all requisitions and work tickets have been entered by the repair order clerk, the customer should be able to secure his invoice with practically no delay. This is a very important point as in many cases failure to promptly render the invoice prevents payment by the customer for the repairs when receiving his car, or else causes annoying and irritating delays. We earnestly recommend that every dealer place his service department upon a cash basis and so arrange his service routine that an invoice is rendered to the customer at the moment that he calls for his car. The invoice need not be itemized if an estimate has been rendered, as shown in Fig. 1-C; otherwise, an itemized bill should be given.

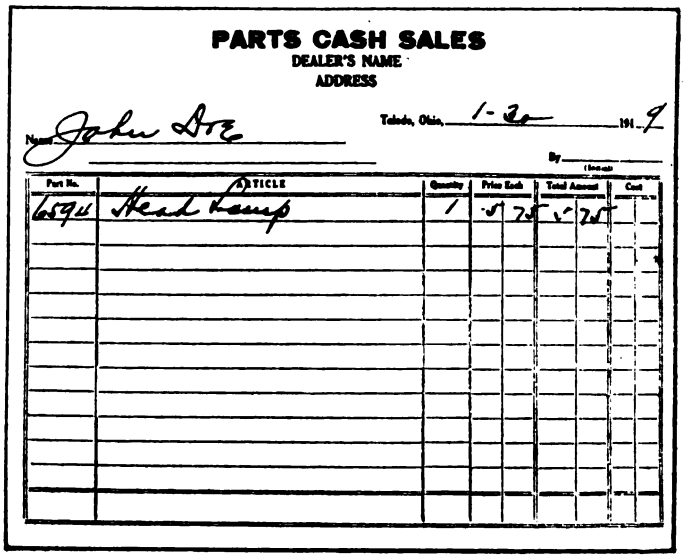

Fig. 9

The strawboard or hard copy of the repair order should be placed on the car in a holder and remain there until the repairs specified are completed. The tester or inspector should check this copy, placing his O. K. and initials on it in a conspicuous spot. The hard copy is then placed in the repair order envelope with all work tickets and requisitions and properly filed.

Work Ticket or Time Slip.

This form (see Fig. 2) is used to record the time the workmen put in on each repair job, as well as the work performed. It is issued in duplicate by the shop foreman or his clerk, who in a smaller organization will also enter it upon the repair order, when that particular job is completed.

In larger establishments one copy of the work ticket, properly signed by the shop foreman should be sent at once to the repair order clerk, after the job is completed; the clerk will then enter it upon the back of the repair order. The other copy should be sent to shop foreman or his clerk to be held until the job is completed, when it is turned in to the repair order clerk, who will use this copy to check against the repair order for possible discrepancies, and then file in the repair order envelope.

Time "in" and time "out" should be clearly marked on every work ticket. It is recommended, although not necessary, that a separate ticket be made out for each operation, even though performed by the same mechanic. If the work requires more than one day a separate ticket should be made out for each day's work. In addition to elapsed time the work ticket should also indicate the work performed. The shop foreman should fill in the columns "hours charge," "hours no charge" and "account" before the slips are sent to the repair order clerk.

Where the service department is conducted by one man the work ticket can be dispensed with and the hard copy of the repair order can be used for this purpose, the time required for each operation being entered behind each item, which the bookkeeper, or the person who makes up the invoice, can enter on the reverse side of the repair order.

Repair Shop Requisition.

This form, illustrated in Fig. 3-A, is used to draw stock from the stock room for use on repair orders. It can be made out by the shop foreman, his clerk or by the workman right on the job. It should be written up in duplicate and both copies of the requisition should be sent to the stock room. After being filled the first copy should be forwarded to either shop foreman or repair order clerk, for entry on back of the repair order. It will then be returned to the parts inventory clerk for entry on the parts inventory cards.

The second copy must be returned to the shop with the parts, where it will be given to the shop foreman or his clerk to be held until the job is completed. When the repair job is finished the requisitions, together with the hard copy of the repair order, are forwarded to the repair order clerk, who will check the requisitions against the repair order to make sure that they have been correctly listed. Requisitions and hard copy of repair order are to be filed in repair order envelope. Parts inventory clerk should check the numerical sequence of the parts requisitions daily, and any missing numbers should be investigated and duplicates secured, if possible.

Repair Shop Credit Requisition.

This form shown in Fig. 3-B is used for the return of parts, requisitioned out of stock for use on repair orders and is

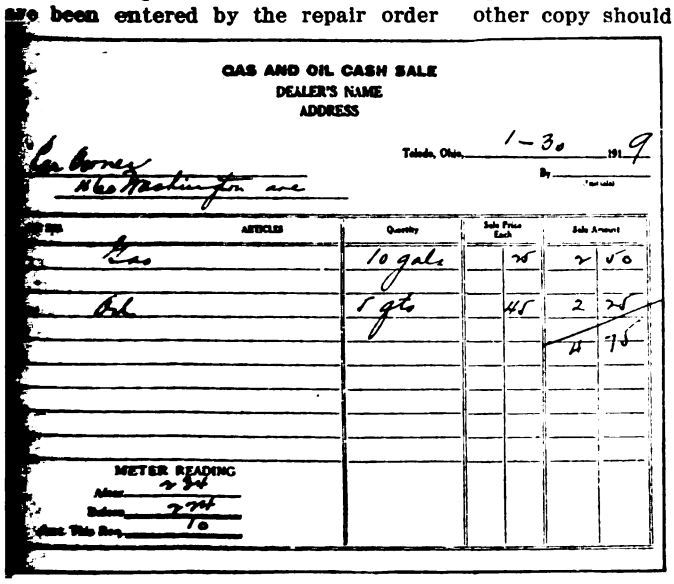

Fig. 8

Digitized by Google

usually issued in duplicate by the repair shop office. Both copies are sent to the stock room with the return parts, where both are signed by the stock keeper. The original is then forwarded to the repair order clerk for entry on the repair order; is initialed by him after entry and sent to the parts inventory clerk for entry on his cards. The second copy is returned to the shop and held by the shop foreman or his clerk until completion of the repair job, when it is forwarded to the repair order clerk, along with all work tickets to be checked against the repair order to see that all have been correctly entered. All credit requisitions are then filed in the repair order envelope.

It frequently happens that more pieces are ordered out then are actually needed for the repair job. The balance are then returned for credit on this form.

Repair Order Envelope.

This envelope, illustrated in Fig. 4, is used to keep all repair order work tickets, requisitions and hard copy of repair order, or any other data pertaining to a specific repair job. It is placed in the

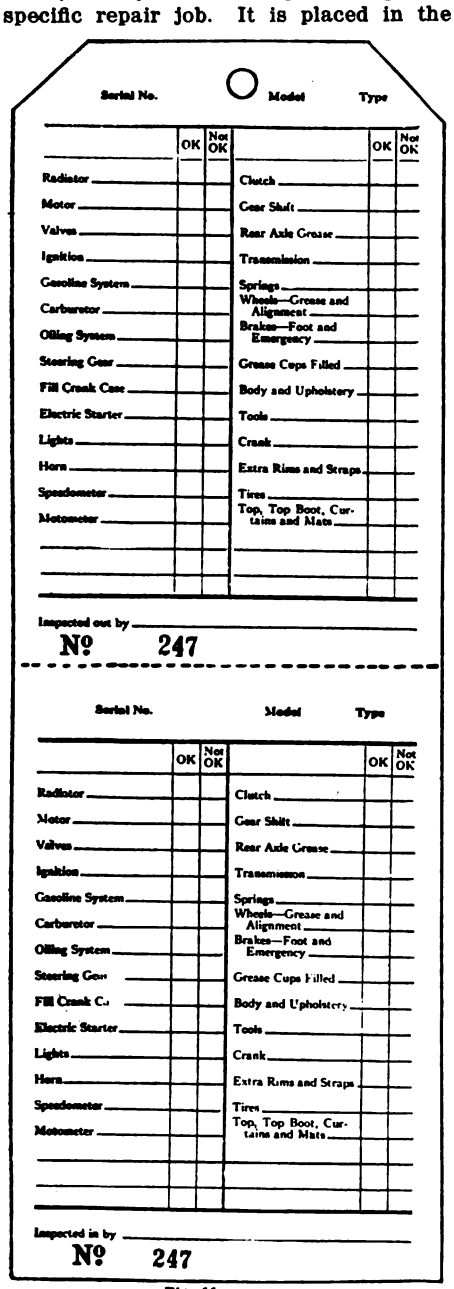

Fig. 11 Front

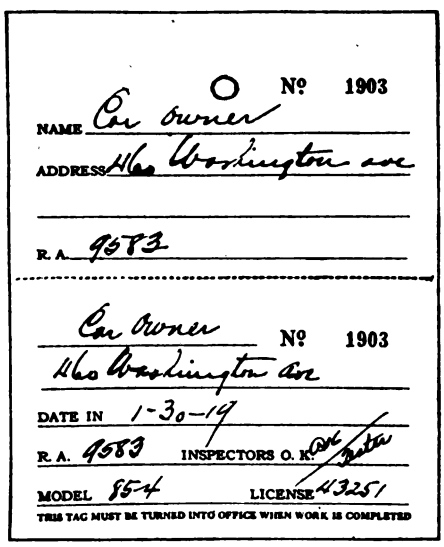

Fig. 10

active repair file until the job is completed, when it is filed away by the service department, numerically by repair order number.

This card, illustrated in Fig. 5, is a file card, kept by the service department, on which should be entered the date and number of every repair order that comes into the shop. In this manner an accurate record can be maintained of every repair or adjustment on a customer's car, information which very often is important in settling controversies. For instance, in the case mentioned on the repair order illustrated here, the purchase and installation of the push rods which proved defective within the guarantee period, would be listed on such a record, verifying the owner's claim for adjustment.

Daily Shop Report.

This form, shown in Fig. 6, can be used in the bigger service stations to record the activities of all mechanics. It will show the amount of time expended upon each job, the day's clock card time and the time elapsed between jobs, if any. It also contains space for the reason for such elapsed time.

In short, it is a summary of the day's work in the repair shop, invaluable to the service manager, or to the head of the company. It should be made out in duplicate, by the shop foreman or his clerk from the time slips. The original should go to the service manager and the duplicate should be retained by the shop foreman.

This report shown in Fig. 7 gives the dealer an accurate picture of each day's business in the service department and should be made out by the repair order clerk for the service manager. It shows at a glance the number of repair orders put through that day, the estimated price, the actual cost for both labor and material, the amount charged and the profit and loss on each job. Can be made out in duplicate, one form for the service manager and the other for the head of the company.

Cash Sales Gas and Oil.

This form, illustrated in Fig. 8, is used to record all gas and cash sales and can be used in all service stations, the number of copies varying in accordance with the number of persons involved in such sales. The usual system is to give one copy to the customer. Another copy of the form should be sent to the cashier and a third copy should be retained by the gas man for his record.

The cashier used his copy to check the cash received and to make out a daily sales record of gas and oil for the day. The cashier also checks the gas tank daily against the day's cash slips and requisitions and any differences can be checked at once.

Cash Sales Parts.

This form shown in Fig. 9 is used to record cash sales of parts, accessories, etc., and like the blank for cash sales of gas and oil, can be used in all service stations, the number of copies of the transaction varying in accordance with the number of people that the sale concerns.

One successful way to handle these sales is to give all three copies to the customer, with instructions to pay the cashier. The cashier then stamps all three copies "paid," retaining one copy and returning the others to the customer. The stock room will then deliver the part or parts to the customer upon surrender of the third sales slip, the customer retaining the original as his receipted invoice.

Where the cashier is not located conveniently for handling the money in this manner the stock room should take the money, turning it in daily to the cashier, who will then check it against the sales slips. The customer, as in the other method, will receive the original invoice.

Entries on the parts inventory cards should be made from the third copies of the cash sales slips, which should be received daily from the stock room, and filed numerically.

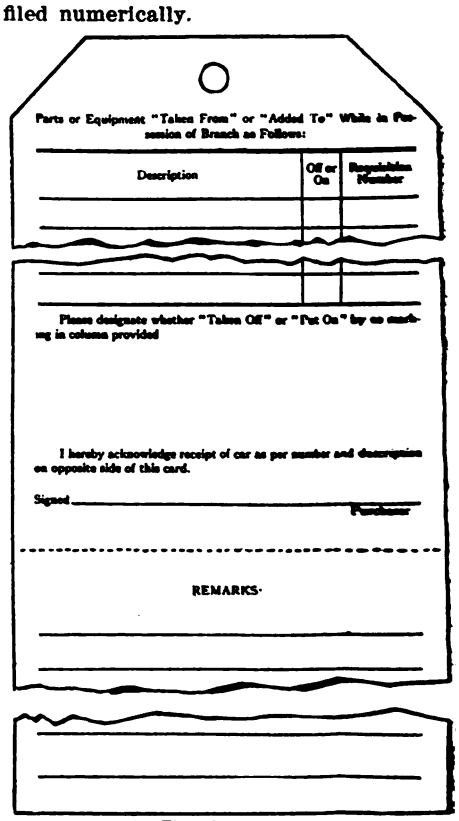

Fig. 11 Back

Digitized by Google

When making sales of parts the customer should be cautioned to keep his sales slip as evidence of his purchase. Should a newly purchased part prove defective within the guarantee period it may be a difficult matter to make the proper settlement unless a positive record of the sales is available.

Identification Tag.

This is a strawboard tag in two parts divided by perforation as shown in Fig. 10, which should be fastened on every repair job that comes into the service department. This tag, made out by the repair order clerk, tells the story of the car.

The lower part of the tag is signed by the tester and is turned in at the service department office. Thus cars with the complete tag are still awaiting repairs or in the process of repair; cars with only the upper half of the tag are ready for delivery.

This card will also tell how long after completion of the job the car remains in the service station, thus rendering possible more accurate storage charges on cars that remain in the garage more than a reasonable period aftre the date promised to the owner, or after the owner has been notified that the repairs on his car have been completed.

New car tag and inspection report. This tag shown in Fig. 11 is used to check "in" upon receipt any new car equipment and for inspecting new cars upon receipt, using the lower half of the card for this purpose; and to check "out" the car when delivering to the customer. Any parts missing or damaged en route can be noted at once, so that proper claims for shortage or damage can be filed.

Any parts taken off or put on the car while in the dealer's possession can be noted on the reverse side of the tag, thus keeping an accurate check on the condition of the car from the time it reaches the service department until its delivery to the customer.

ARMY MOTOR TRANSPORT TRAINING SCHOOLS.

The United States Army is definitely launched in the field of vocational training for the motor transport corps. It has no option in the matter, for men skilled in automotive vehicle operation and repair do not exist in anything like adequate numbers for the requirements even of civil life; and the war with Germany has demonstrated that no matter how good our army may be in other respects, its efficiency will be conditioned by that of the motor transport branch.

Therefore, the army is organizing schools to train men in the various branches of automobile repair, construction and operation. They are real schools under trained teachers where the time of the pupil is wholly devoted to receiving instruction.

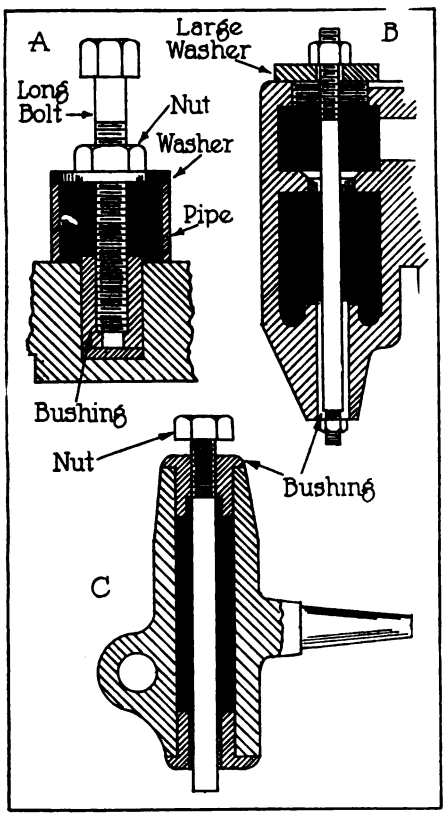
Apart from the military necessity, the automotive industries will benefit by the establishment of this training system.

The United States Civil Service Commission is receiving applications to fill 150 positions of assistant instructor in motor transport training schools.

BUSHING REMOVAL METHODS.

Methods for removing three different types of bushings are shown in the following cuts: A illustrates the removal of a blind bushing that does not completely fill the bore. The bushing is threaded as far as possible. A bolt is screwed into the bushing. A nut is run on the thread at the upper end of the bolt and passed through a plate resting upon two blocks, one at each side of the bolt. By turning the nut with a wrench the bushing is removed.

B illustrates the removal of a valve



stem bushing. A long bolt is passed through the plug opening at the top and the guide at the bottom. A nut is placed on the bottom of the bolt covering the edge of the bushing. A washer and nut are placed at the top covering the plug opening. Turning the top nut will withdraw the bushing.

C illustrates the removal of collared bushings of steering knuckles, etc. Tap one bushing and insert a rod threaded at one end. By driving on the opposite end it is claimed that the bushing may be easily driven out. The new bushings will drive into place without much effort, but will probably have to be reamed for the spindle bolts.

FINE FACTORY FOR TRAILMOBILE.

The new factory of the Trailmobile company in Cincinnati is rapidly nearing completion and will be one of the finest in the industry devoted exclusively to the manufacture of trailers. The first unit will occupy space 200 by 500 feet.

The recent displays of the company's trailers at the California, Texas and Ohio state fairs, and the Cincinnati automobile show, attracted favorable attention.

SIMPLE METHODS OF TESTING LUBRICATING OILS.

To learn whether an oil contains solid impurities, add kerosene to half a cup of oil until the mixture becomes quite thin. This thin fluid is now passed through filter paper or ordinary colorless blotting paper. As soon as all the thinned oil has been passed through it the blotting or filter paper is washed with kerosene. The residue that remains, if there is any, will show whether the oil contains any solid impurities. Impurities of this kind may also be determined in a coarse way by smearing a piece of common correspondence or pad paper with the suspected oil and holding it against the light. If the oil is free from solid impurities the blot of oil will be equally transparent everywhere. If not, the solid particles of sediment will be plainly visible.

To test oil to learn whether it will become resinous, pour a quantity into a shallow dish and place in a warm place for about a week. If at the end of this period there is not the slightest evidence of crust the lubricant may be considered safe to use. Oils may also be tested by mixing them with nitric acid. If the oil is pure a thick mass will form in a few hours. Oils that contain resin do not clot, but remain very thin.

Among other impurities in oils are acids. When acids are present in lubricating oils they etch the polished surfaces of bearings and cause excessive friction and gradually destroy them. A test for such impurities is mixing the oils with copper oxide or copper ash. These are added to the oil in a glass container. If the oil is free from acid it retains its original color. If acids are present their action on the copper makes the resulting color greenish or bluish. This test may also be made by dropping the oil on a sheet of copper or brass. Leave it for a week and if acid is present a greenish discoloration will be seen on the metal. Another chemical test for acids is the use of litmus paper, which will show the presence of acid by turning pink, or its absence by turning blue when inserted in the oils.

A rough and ready method to compare the lubricating values of several oils is to place a few drops on a smooth, slightly inclined metal or glass sheet. The lighter oils will naturally reach the bottom first and should be used on high speed bearings.

J. T. TRACTOR MOVING PICTURES.

The J. T. Tractor has an enterprising representative in the Canton, O., field, in A. N. Whistler, who is giving in his territory a motion picture demonstration of the work of this machine. This is a two-reel run, bringing out the principal features of the J. T. Tractor, showing its construction and method of operation and its utility as a labor saving farm device, and the pictures were explained by Mr. Whistler as they were shown.

Considerable interest has been manifested in the pictures, which have resulted in a number of sales being made.

The McCord Manufacturing Co., Detroit, through C. B. Bailey, general manager of the Wyandotte plant, announces another record breaking month's business by the gasket division. Shipments for September exceeded those for August, the best previous figure, by over 28 per cent. Orders for current and future delivery continue to pour in and it is assured that the factory will be working at top speed throughout the winter. The management is fortunate in having sufficient raw material on hand and in transit to take care of manufacturing demands for months to come. Mr. Bailey also announces the appointment of Malcolm McCormick in charge of sales and advertising. Mr. McCormick for a number of years was associated with the Burroughs Adding Machine Co. and Chalmers Motor Co. An aggressive sales and advertising campaign is planned for the coming year. The McCord Manufacturing Co. has published a catalog completely describing and giving the specifications for all the various copper-asbestos gaskets which it manufactures. Included are spark plug gaskets, exhaust and flange type gaskets, exhaust manifold head gaskets, cylinder head gaskets for passenger cars and trucks and valve plate gaskets and Ford gaskets. An assortment of shim stock is also shown, as well as miscellaneous gaskets of open and enclosed types.

The Hudson Motor Specialties Co., 1932 Arch street, Philadelphia, announces that it will be represented by Hughsch & Merton, Inc., in Washington, California, Wyoming, Nevada, Colorado, New Mexico, Oregon, Idaho, Utah and Arizona. Hughsch & Merton, Inc., which will act as sales representative, has offices in San Francisco, Portland, Ore., and Denver.

The J. P. Gordon Co., Columbus, O., has issued a new catalog for its auto slips, seat covers, tire covers, top recoverings and radiator robes. Samples of the materials used are included.

Harrison H. Boyce of the Moto-Meter Co., Inc., has become sole owner of the fundamental Erwin patent, long recognized in the fire extinguisher field as basically covering automatic means of extinguishing fires under the engine hood of passenger cars, trucks and tractors. It is understood that Mr. Boyce will form a new company for the exploitation of this invention.

The Black & Decker Manufacturing Co., close upon the heels of the news regarding the removal of the general offices from Baltimore to the new office building at Towson Heights, announces that ground has been broken and work started on a new and larger plant for the company. The new plant will be 100 by 200 feet and will be erected on the west side of the present plant and directly connected with it. The demand for the Black & Decker Towson built devices has made this extension necessary, and it is believed that the output during 1920 will be more than double that for this year.

The Roller-Smith Co., 233 Broadway, New York, announces the appointment of the Alfred Collyer Co., 83 Craig street, west, Montreal, as its agent for the entire Dominion of Canada and Newfoundland. The Montreal firm will handle the Roller-Smith products of instruments and circuit breakers.

The J. C. McAdams Sales Co., Vanderbilt building, New York City, has placed on the market a new device to be known as the "Auto Spark Lite." This article was invented and patented by Mr. Herman Schlaich, chief experimental engineer at the Moto-Meter Co., Inc., Long Island City, N. Y. Men prominent in the automotive industry who have seen the device speak very highly of it, and it is expected that the company will make a big success.

The Ford Motor Co. is to erect a body building plant on the River Rouge, near Detroit, which will have a producing capacity of 1500 bodies daily and provide employment for between 10,000 and 15,000 men, according to announcement by F. J. Hadas, general superintendent of the body plant. "We have set a mark of 1,000,000 automobiles this year," he said, "and unless the unforeseen happens we will do it."

The William Small Co., Indianapolis, manufacturer of Monroe automobiles, announces the appointment of Louis Chevrolet as consulting engineer. Chevrolet was until recently chief engineer of the American Motors Co., Plainfield, N. J.

The Stow Manufacturing Co., Binghamton, N. Y., has issued two new bulletins, Nos. 103 and 104, illustrating and describing its complete line of portable tools.

The F. H. Lawson Co., Cincinnati, O., is manufacturing two new accessories, the White radiator for Ford cars and the Lawco rim tool.

Edward V. Hartford, Inc., maker of the Hartford shock absorber, has moved into a new factory at West Side avenue and Carbon place, Jersey City, N. J. Here there are greatly increased manufacturing facilities. Executive offices have been moved to 35 Warren street, New York City. Communications should be addressed to the New York office, but all return material must go direct to the factory in Jersey City. Arrangements have been made with the Doty-Demos Co., 224 West 65th street, New York, to care for all local service, repairs and attaching work, as well as carry a complete line of spare parts for all Hartford products. This station will be known as the "Hartford Shock Absorber Service." The Doty-Demos Co. will give the usual trade discount.

The Auto Indicator Co., Grand Rapids, Mich., maker of the rear signaling device known as the "Four-in-One Auto Indicator," announces that Charles O. Blackford, the sales manager, recently returned from an extended trip, during which he closed eastern and southern territory and brought back orders and contracts for more than 30,000 indicators. The company's factory is running overtime. More than 10,000 indicators have been shipped to the western coast representative, the Norman Cowen Co., Rialto building, San Francisco, during the last few weeks and this number only fills half of its orders to Oct. 1. Other representatives of the Auto Indicator Co. include the Automotive Exchange of America, Hippodrome Annex, Cleveland, O., for southern territory; S. P. Record, 405 Commercial avenue, East Braintree, Mass., for New England; Auto Indicator Sales Co. of Indiana, 438 Lemcke building, Indianapolis, for Indiana; the Penn-Jay Co., 112 North Broad street, Philadelphia, for Pennsylvania and New Jersey, and the Diamond Tire and Supply Co., 130 Oneida street, Milwaukee, for Wisconsin. The indicator retails for $15 allowing a liberal margin for dealers, garage men, etc.

The Acme Motor Truck Co., Cadillac Mich., has begun construction of the first of four units made necessary because of the ever increasing volume of business coming to the company. The body building department also is rapidly expanding and for several months past orders have been ahead of production. Doubling of the capacity of the present plant was decided upon some months ago.

CHILE AS AN AUTO MARKET.

American automobiles have become remarkably popular in Chile during the last five years. This has not been wholly due to the elimination of European sources of supply in the war period. It has been largely the result of a growing familiarity with the conveniences of motor driving, combined with the discovery that these advantages are possible for people of moderate means through the comparatively low prices of certain American cars. Moreover, the high grade American makes have been demonstrated with success to the class of Chileans that can afford expensive machines. In the social life of the cities the motor car has become an essential, replacing the family coach or carriage.

Outside the cities the lack of good roads in Chile seriously affects the use of automobiles. The roads of Chile are especially severe on tires, and shipments of tires have shown a great increase principally on this account. Shipments of automobiles from the United States to Chile have represented practically all of Chile's trade in this line since 1916, but the United States' share of this business in 1913, the last pre-war year, was but little more than eight per cent. Germany had 22 per cent. of the trade, France 23 per cent., Great Britain 13, Italy nine and Belgium four, and about 16 per cent. came through Argentina.

Chilean authorities, both local and national, are beginning to realize that good roads are needed for the development of the mining and agricultural industries. Iquique, the chief port in the shipment of nitrate, offers an especially good market for motor trucks if these prove to be adapted to the hauling of supplies through the nitrate desert. Experiments are being made with motor trucks on the soft sand roads, and if the success of trucks is thoroughly demonstrated they will undoubtedly replace the slow and expensive teams and carts.

AUTO TIRES FOR MEXICO.

The great majority of auto tire importers in Mexico City prefer to have their tires packed as follows: First, each tire should be wrapped individually in heavy manila paper and then made up in bundles of from three to six, according to size. These larger packages should be wrapped in extra heavy waterproof paper or hemp cloth to insure their arrival in fresh condition. One firm recommends shipping eight or 10 tires in a wooden box, (but this is not universally approved because of the added weight, which means increased freight charges and increased duty. The duty on tires is 37½ cents United States currency per kilo of 2.2 pounds. The total average cost of freight and duty on outer tires laid down in Mexico.

The estimated number of automobiles in the Mexican republic is 18,000.

MARKET IN BELGIUM.

There is a market in Belgium at the present time for American automobiles. The machines desired are those of a moderate price, not above $800 to $1000, and need to be strongly built, as many Belgium roads are of cobblestone construction. No special adaptation of American cars to Belgian needs seems to be required. The ordinary five-passenger touring car is especially popular.

FOREIGN TRADE OPPORTUNITIES

(Reserved addresses may be obtained from the Bureau of Foreign and Domestic Commerce, Washington, D. C., or from district or co-operative offices.)

30,841—The representative of a firm in South Africa is in the United States for a short time and desires to purchase and secure agencies from manufacturers of automobiles and general merchandise. References.

30,858—The president of an American trading corporation is soon to sail for the Balkan countries and desires to secure agencies for the sale of automobiles, motors, agricultural machinery and implements, etc. References.

30,799—The director of a firm in Belgium desires to secure an agency for the sale of automobiles, motorcycles, agricultural machinery and their parts. Payment, cash. Correspondence with catalogs should be in French. References.

30,800—A firm in Switzerland desires to secure agencies for the sale of large and small automobiles, motor side cars and all accessories. Quotations should be given f. o. b. Switzerland. Correspondence should be in French. References.

30,807—A manufacturer with a storehouse in Spain desires to secure agencies for the sale of greases, gasoline, automobiles, electrical supplies, etc. Correspondence should be in Spanish. References.

30,817—The representative of an American firm who is about to sail for Europe desires to secure agencies from manufacturers for the sale of automobile tires and general merchandise. Reference.

30,819—The representative of a firm in Argentina is in the United States and desires to secure an agency for the sale of automobiles and accessories. References.

30,790—A company in Switzerland organized for the purpose of trade with the United States desires to purchase and later secure agencies for the sale of leather suitable for covering automobiles. Samples, quotations and complete information should be given. Correspondence may be in English. Payment, draft against documents. Reference.

30,764—The sole agency in Czecho-Slovakia is desired by a firm in that country for the sale of passenger auto cars and motor trucks. It is stated that he can sell about 25 large 50-horsepower auto cars and about 40 small auto cars of 18 to 25 horsepower monthly. Correspondence may be in English. References.

30,741—An engineer in Poland desires to secure agencies for the sale of rubber tires for automobiles. References.

30,675—A merchant in Arabia desires to purchase 500 each of tires and tubes to fit Ford motor cars, 300 spark plugs and 25 magnetos. Quotations should be given c. i. f. destination. Payment against documents through bank. Reference.

30,879—An agency is desired by a man in Italy for the sale of automobiles and gasoline. References.

CROCKETT MOTORS AND EXPORT.

The Crockett Motors and Export Co. has been organized in New York, with headquarters at 42 Whitehall street, to take over the H. B. Crockett Co., well known for many years as export agent and import representative, doing business largely in the automotive field. Since the armistice was signed orders have been received for more than $4,000,000 worth of automotive products. The company has agencies throughout the world.

The New York Automobile Dealers' Association has decided to aid the Actors' National Memorial Day program, Dec. 5, and will give generous contributions. Daniel Frohman recently addressed the association in behalf of the nation wide benefit to take place for the Actors' Home and the Actors' Fund. Under the auspices of the Automobile Dealers' Association the Winter Garden, on the afternoon of the national benefit day, will resemble a family theatre party of automobile, accessory and tire men and their friends. The attraction will be the Shuberts' "Passing Show of 1919," which is now in rehearsal and will be produced in that theater for the first time during November. Tickets will not be sold for the performance, but they will be given as compensation to those who contribute generously with checks, in such proportion as the contributions demand. Officers of the general committee of the dealers' association are: Major H. L. Stratton, chairman; H. T. Gardner, secretary, and Frank G. Carrie, treasurer. The vice chairmen are Charles E. Miller for the accessory division, Arthur E. Randall for the Brooklyn division and John B. Elsey for the Bronx division. The executive committee consists of Harry J. De Bear, chairman; William C. Poertner, C. D. Studebaker, J. A. Clark and A. G. Southworth.

The Intra-State Motor Dealers' Association was recently formed at Reading, Pa. Units from Harrisburg, Reading, Allentown, Bethlehem, Easton, Lancaster and York were represented. George G. McFarland, president of the Harrisburg Motor Dealers' Association, was elected president. About 60 dealers attended.

The Hudson County Automobile Trades Association of New Jersey is going ahead with plans for the permanent organization. The association was formed by 12 of the prominent automobile dealers in the county. Archie Elder, president of the Hudson County Oakland Motor Car Co., is temporary chairman, and Robert W. Bowler secretary pro tem. A visiting committee has signed up most of the dealers of the county. It is planned to receive into membership later all of the automobile accessory and garage men.

The Rocky Mountain Auto Trades Association held its third annual convention at Colorado Springs, Oct. 5-8. More than 800 automobile and accessory dealers attended. It was decided to raise a fund to engage a lawyer who will prosecute automobile thieves who steal from any dealer in the Rocky Mountain region. Addresses were made by F. W. A. Vesper, president of the National Automobile Dealers' Association; L. C. Brock, president of the Philadelphia Auto Trades Association, and Edward J. Jordan of the Jordan Motor Car Co., Cleveland. The delegates approved the Townsend bill now before Congress. S. E. Norton, president of the Denver Auto Trades Association, said that passage of the bill would mean a great deal to the automotive industry. A golf tournament and sight seeing trips were among the social features.

The Portland Oregon Motor Car Dealers' Association have received from automobile mechanics of the city a proposed agreement calling for closed shop, 44-hour week with half holiday Saturday and no Sunday work, and division of all mechanics into four general classes. David M. Ellis, business agent for the new union of mechanics, claims 700 members and states that it will soon be state wide in scope. The law passed by the last Legislature requiring that automobile mechanics pass an examination and pay a $5 license fee caused the men to organize. Under the proposed agreement double pay would be paid for overtime on Saturdays, but no Sunday work would be done under any circumstances. The wage scale does not differ materially from the one now in effect.

The Pittsburgh, Pa., Automotive Association is considering the advisability of two automobile shows each year. John J. Bell, manager of the association, says. "I have always maintained that a winter showing, at which models are displayed, helps the trade just as much as a display of the model placed on the market in the spring. There isn't a doubt but that the motor car is seasonable merchandise, so far as body types are concerned."

The Philadelphia Automobile Accessory Business Association will distribute certificates of membership to members in good standing, these certificates to be displayed in the members' places of business to signify that they follow high business ethics.

The National Automobile Dealers' Association held a four-day convention in Denver, Col., beginning Oct. 1. The Townsend bill was favored. The last two days of the convention were spent in Estes Park in the mountains. A tour through the Rocky Mountain National Park was another feature. In Denver the delegates were entertained by Robert R. Hall, president of the Cadillac Motor Co. of Denver, and by the Denver Automobile Trades Association. President Vesper presided. Directors of the association who attended included E. W. Steinhart, Indianapolis; Harry G. Moock, St. Louis; Thomas J. Hay, Chicago; A. F. Maltby, Philadelphia; W. J. Brace, Kansas City; P. E. Chamberlain, Denver; A. E. Metzell, Canton, O.; George D. McCutcheon, Atlanta; J. A. Graham, Minneapolis; P. H. Greer, San Francisco; C. A. Vane and B. Hudnall, St. Louis.

The Motor Trades Association of Allegheny County, Pa., inaugurated a vigorous "Good Roads and Better Streets" movement at a recent meeting. The session was an open one, having been arranged by Manager K. J. Frane as a smoker and "membership booster." Many new members were enrolled. W. A. Johnson, sales manager of the B. F. Goodrich Rubber Co., Akron, was a speaker. A "Good Roads Committee," was appointed to gather data to be used in connection with an effort to induce the Legislature to provide funds for improved roads and also for presentation before the City Council. Another item considered was a proposed bill to be presented to the Legislature that would place a lien on any automobile for which the owner may contract charges and would give the holder of the lien the right to sell after 30 days notice.

The Detroit Auto Dealers' Association announces that its autumn show of enclosed cars was a success. Forty makes of cars, with 100 different body types, were shown.

The Pine Bluff, Ark., Auto and Accessory Dealers' Association is planning for an automobile show. The local association expects to affiliate with the state and national associations.

The Baltimore, Md., Automobile Dealers' Association has awarded several prizes to those who took part in its motor truck demonstration parade.

Alwin A. Gloetzner, former vice president of the Covert Gear Co., Inc., has purchased the majority holdings in the company's stock formerly owned by P. A. Clum, Rochester capitalist. As a result

Alwin A. Gloetzner, President and General Manager, Covert Gear Co.

he control and direction of the big Lockort company's transmission business asses into the hands of the man largely esponsible for its recent success and exansion. Mr. Clum's retirement from the residency has been followed by Mr. loetzner's promotion to that post. He lso assumes the general management of ie company. As director of sales and ngineering of the Covert forces Mr. loetzner has been for years the chief oint of contact between the company nd the automotive industry. His horough experience in factory manageent, secured in a prior connection with ie Chalmers Motor Car Co., further ualifies him for his broadened activities. The Covert Gear company is one of the ioneer specialists in the building of ears and transmissions in which it has een a prominent factor for more than years. Its factory is centrally located serve the entire automobile industry. n account of its long experience in gear id transmission manufacture the comany has in recent years specialized in e field of truck transmissions and supies a large list of clients. Mr. Gloetzr will make his headquarters at the ctory, but the company will continue s sales and engineering offices in Deoit for the benefit of its clients and to d in taking care of its rapidly expandg business.

L. P. Lessard is now with the M. D. ewald Co., Milwaukee, distributor of the ewart truck in Wisconsin. He was forerly assistant sales manager of the rker Motor Truck Co., Milwaukee.

L. F. Worth is now with the B. F. odrich Co., after having been for over o years in war service. He will be astant manager of the South Bend anch.

Vern Smith is now sales manager of) Elcar Motor Sales Co., Grand Rapids, ch

Frank W. Cooke is now general service manager of the Universal Auto Co., Hartford, Conn. He was formerly general superintendent of the Pope Manufacturing Co., which position he held for 20 years. He was at one time general superintendent of the Norwich plant of the Marlin-Rockwell Corporation.

T. C. Baker succeeds R. P. Page, Jr., in charge of the Boston branch of the Autocar Co. Mr. Baker during the war was chief motor transport officer of the first army in its campaign in France.

H. Jack Conrad has become affiliated with the Carhart Motor Co., Oklahoma City, Okla., dealer in Willys Knight and Overland cars. He was formerly with Nash.

W. J. Buell, associated with the Chicago branch of the Reo Motor Car Co. for a number of years as manager of the exchanged car department, is now manager of the company's branch at Evanston, Ill.

L. T. Knocks, formerly experimental engineer of the Waukesha Motor Co., Waukesha, Wis., is now chief engineer of the Falls Motor Corporation, Sheboygan Falls, Wis.

S. J. Turnes is now general sales manager of the Brunswick-Balke-Collender Co., Chicago, in charge of the tire department. He was formerly advertising manager and will continue in charge of advertising for the general line as well.

L. B. Southerland is in charge of the sales department of the new Chicago branch of the Cadillac Motor Car Co. He formerly sold Cadillac cars in Philadelphia. He will be assistant to C. R. Cunliffe, who recently became manager.

C. W. Branney has become sales manager of the truck department of the Paige Sales Service Co., Detroit, Mich.

Mark A. Smith, captain of Marines in the A. E. F., has re-entered civil life as an expert on the engineering staff of the Midwest Engine Co., Indianapolis, Ind.

Mark A. Smith, Tractor Sales Engineer Midwest Engine Co.

Before the war he was in charge of the passenger car lubrication department of the Standard Oil Co.

Roy Davey has been advanced from assistant sales manager to general sales manager by the Bethlehem Motors Corporation, Allentown, Pa., with the resignation of W. E. Stevenson, who for a con-

Roy Davey, Sales Manager, Bethlehem Motors Corp., Allentown, Pa.

siderable time filled that position. Mr. Davey has had wide experience in selling and advertising. He was assistant advertising manager for the Acme White Lead Co. in 1904 and the following year joined the Burroughs Adding Machine Co. and was engaged in sales planning and promotions. In 1911 he went to the Packard Motor Car Co. as assistant manager of the truck division and in 1915 became sales plan director for the Thorsen-Seelye Advertising Agency of Detroit. He resigned this position the following year to become advertising manager for the Chalmers Motor Co. and in 1918, when the Maxwell Motor Corporation leased the Chalmers plant, he joined the Bethlehem organization. His endeavors were so succcessful that he was selected to carry on the work of the department.

C. W. Couch has joined the forces of the Ford-Clark Co., Cleveland, as sales representative for the Ford-Clark line of automotive specialties. He was recently discharged from army service and prior to the war was with the Western Automatic Machine Co.

Jay V. Hall has joined the Willys Corporation at the Duesenberg plant. He was formerly general sales manager of the Olds Motor Works, having resigned that position two years ago to join the Willys organization.

Walter C. Allen has formed the Allen Waring Auto Corporation, which will distribute the Maibohm Six. The company will be located at 236 West 54th street, New York City.

James R. Hayes is now assistant advertising manager of the Powrlok Co., Cleveland, O. He was recently released from government service, where he was connected with the Detroit office of the director of purchase, storage and traffic in the production of motor vehicles.

Automobile Starting, Lighting and Ignition Systems

For Detailed Chart See Pages 40 and 41.

IN A single chart it is not possible to show all forms or modifications of automobile starting, lighting and ignition systems in use. A typical system, including all important parts, is shown, and supplementary diagrams reflect several generally used systems. Regardless of type, a motor or dynamo will have the same general construction and will have similar accessories. Other units may vary in design, but the same faults will develop in all of them. The battery ignition system is in two forms: The closed circuit, as typified in the Remy system, and the open circuit as in the Delco. The timer, battery, coil and spark plugs are practically the same in either system.

Hints for Locating Delco Trouble.

1. If the starter, lights and horn all fail, the trouble is in the storage battery or its connections, such as a loose or corroded connection or a broken battery jar.

2. If the light, horn and ignition are all right, but the motor fails to turn the engine, the trouble is in the motor generator, such as dirt or grease in the motor commutator.

3. If the motor fails to turn, or turns very slowly and the lights go out or become very dim, it indicates a loose or corroded connection on the storage battery, or a battery that is nearly discharged.

4. When two set of batteries are used for ignition purposes, the following tests may be made:

If the engine fires on the "M" button, but not on the "B" button, the fault must be in the wiring between the dry cells or the wires leading from the dry cells to the switch, or depleted dry cells. If the ignition functions on the "B" button and not on the "M" button, the cause must be in the leads from the storage battery to the generator, or the lead running from the rear terminal on the generator to the switch, or in the storage battery itself, or its connection to the frame of the car.

5. If both systems of ignition fail and current is supplied from both the storage battery and the dry cells, the cause must be in the coil, resistance unit, timer contacts or condenser. This is apparent from the fact that these function for each system of ignition.

Summary of Starting Failure Causes.

Starting motor cranks very slowly: Indicates battery almost discharged, battery sulphated, engine stiff, brushes loose and poor contact.

Starting motor does not rotate: Battery may be discharged, starting switch not making good contact, motor brush may not make contact with commutator, battery terminals may not make good contact, switch contact poor.

Starting motor rotates but does not crank engine: Roller clutch does not function, gears not properly meshed; if Bendix automatic, spring may be broken.

Starting motor turns and engine will not pick up under its own power: These indicate that the trouble is not in the starting system, Bendix starter gear on threaded shaft may be stuck or spring broken.

A weak starting motor is sometimes caused by using carbon brushes. The latter have three to four times the conductivity, and for this reason their replacement by cheap carbon will not allow sufficient current to pass.

If the battery is normal examine the

DEFECTS IN AUXILIARY UNITS

Storage Battery.

Fault.	Cause.	Restoration.
Liquid low in one cell.	Cracked or broken jar.	New Jar.
Electrolyte gravity will not rise.	Sulphated.	Take to experienced battery man.
Overheating.	Liquid low or charged too rapidly.	Refill with water and inspect regularly or alter generator.
Electrolyte leaking at top.	Solution too high.	Draw out a quantity with syringe.
Battery constantly low.	Under charging.	Examine generator brushes; if right, increase charging rate and charge battery from an outside source.
Buckled plates.	Overheating.	Charge at lower rate, keep liquid in cell keep temperature below 110 degrees
Battery exhausts quickly while idle.	Short circuits.	Examine wiring and renew insulation.
Frozen battery.	Discharged in cold weather.	Damage may be irreparable, charge fo crystalization.
Rotting insulators.	Impure water, too much acid.	Use distilled water or melted artificial ic
Battery will not charge.	Connectors loose or crystalized plates.	Resolder connectors and plate holders.
Terminals corroded.	Acid leak through vent.	Clean with ammonia or washing soda.
Jars break rapidly.	Battery not properly fastened down.	See that cleats and bolts are drawn tigh
Separators punctured.	Overheating.	Renew separator and keep battery fille
Lights rise and fall.	Battery low.	Recharge outside or by a long run at miles per hour.
Battery will not operate after storage.	Should have been kept charged.	Probably cannot be repaired owing disintegration.
Lamps dim although electrolyte is at high level.	Specific gravity too low.	Bring specific gravity up to 1.275 charging, see that the generator gi 20 per cent. more current than la consumption.
Electrolyte down to 1.100.	Overdischarge.	Give reforming charge at three amp until maximum density is reached.
One cell dead.	Insulation destroyed.	Watch overheating and overcharg keep electrolyte up.
Battery dead from usage.	Using without restoring.	Charge for 24 hours at rate marked battery or until electrolyte read 1.275.
Large sediment deposit.	Active material dropping.	Take battery to service station at o as material has become loosened.

Digitized by Google

connections, beginning with the battery. The current may be shorted, due to electrolyte spilled over the top of it; or the terminals may be sulphated, in which case resistance to the current may prevent the motor operating.

Scrape off the sulphate and wash all the surrounding metal parts in carbonate of soda or some other convenient alkali. Then replace the wires and coat them thoroughly with vaseline to prevent further corrosion.

With the starting switch closed, begin with one of the wires running from the battery, loosening the various connections in the starter circuit one by one, and note at each point whether there is current flowing by pulling the wire away from the terminal. If there is no current the motor will not operate, and either there is a dead short circuit in some part of the system, or there is a broken wire or connection. An inspection should locate the trouble.

The battery terminal where it is grounded to the frame on single wire systems should be examined to see if the connections are good. This terminal and its contact surface should be kept clean and drawn very tight if not soldered.

Lighting Faults.

If the lights go dim a short circuit is indicated between the battery and starting switch or between the starting switch and ignition generator. The most probable cause is a discharged battery, resulting from leakage of current due to short circuits in the wiring; using bulbs of higher candle power than those recommended; using low efficiency carbon filament bulbs, or defects in the generator which prevent it from charging. Make sure that the generator protective fuse on the relay regulator base is not burned out. Another possible, though hardly probable cause, is that the relay points might remain closed. This would cause the current from the battery to be dissipated in the windings of the ignition generator. If this is the case, remove the cover and release the contact points of the relay with the fingers. If the contact points are roughened or pitted, draw a strip of very fine sandpaper lightly between them and carefully remove all dirt or dust. If the generator protective fuse or circuit breaker is intact and the ignition generator is not charging, the relay regulator cover should be removed and all contact points examined to make sure that they are not kept separated by a small particle of foreign matter that will not conduct electricity. A small quantity of dirt between the points will keep the generator current from flowing to the battery and will naturally cause a discharged battery in time.

Digest of Lighting Faults.

Lamps do not light. Examine the fuse block for blown fuses. If the fuse is blown do not replace it immediately, but look over the wiring for an accidental ground or short circuit. When the trouble has been located and corrected, replace the blown fuse with another of the same capacity. If the fuse is not blown, look for open circuits, loose contacts, battery disconnected or accidentally run down, or burned out lamps. In case the battery is run down, recharge it immediately from an outside source.

No lights or dim lights, with the engine running: There is a group of troubles which may be classified under the general head of open circuits. Eleven of these are very prominent:

1—The generator terminal or brush connections may be loose or making poor contact.

2—The wire connections to the switch may be defective.

3—Defective wire connections to connector terminals.

4—Lamp socket terminal disconnected or loose.

5—Burned out bulbs.

6—Halves of connectors do not make contact.

7—Bulb bases not contacting with lamp sockets.

8—No connections between lighting switch terminals.

9—Broken wires, especially where taped.

10—Joints or places subject to abrasion.

Lamps burn out often. Due to either poor grade of lamp or the lamps are not of proper voltage. With the dynamo on the regulator cut out not operating or the lamps may be of inferior grade.

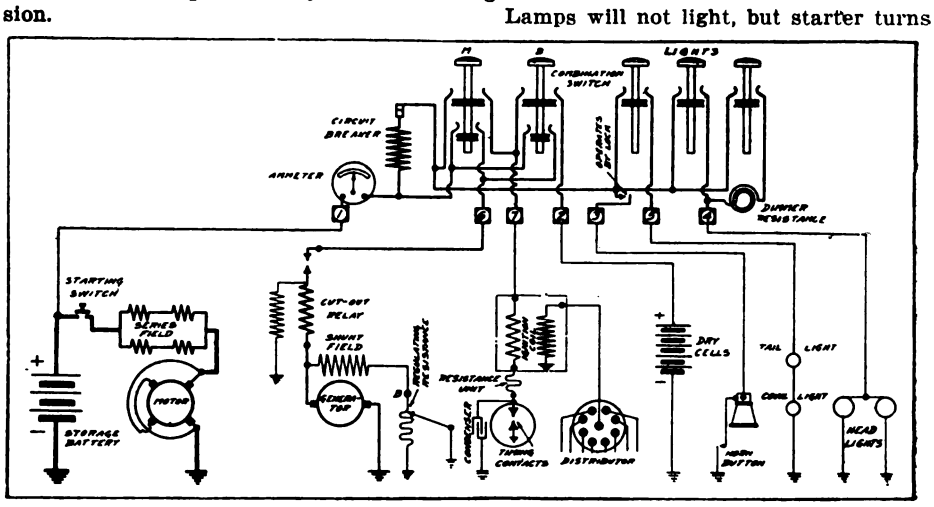
Lamps flicker and ammeter unsteady. Loose connections in light wires, loose connections between battery and generator, loose contact at lamp bulb, exposed wire touching the frame intermittently, causing a short circuit.

Lamps burn very dimly when starting pedal is used. Battery very weak, nearly discharged; battery damaged, probably one or more cells, due to lack of water, or battery terminals not rigidly fastened.

Lamps become dim when engine stops. Indicates a discharged battery. If possible have the battery charged at once from an outside source. If this cannot be done, endeavor to run with fewer lights than normal, for a few days, until the battery voltage picks up.

If the lights grow dim when the car is accelerated the wires are reversed at the generator.

Lamps will not light, but starter turns



Wiring Diagram of Cole Eight Delco One-Unit.

11—Defective connections at the lamp sockets.

Lamps in one circuit do not burn, caused by: (a) The lamp is burned out. Try another lamp in the same socket. (b) If the fuse is blown, try the same fuse in another circuit. Examine the wiring thoroughly before replacing the fuse. (c) An open circuit, or broken connection in the wiring. Examine the places where the connections are made on that particular circuit.

Fuses blow repeatedly. Lamps defective or a short circuit. Try new bulbs.

Lamps go out for an instant only. If the lamps in one circuit so fail there is probably a loose connection on the circuit. If all the lamps go out for an instant there is probably a loose connection at one end of the wire from the generator terminal to the fuse box.

All lights burn dim. The usual cause for this is loose or slightly grounded connections, or poor or corroded connection at the battery. Possibly the battery has not had sufficient charging. Lamps may be old and blackened, try new bulbs.

Lamps too bright. Regulator set for higher voltage. Use bulbs of higher voltage.

the engine. Lamps burned out or filament broken, system short-circuited or open circuit, at fuse or switch.

Lamps burn bright, but fail to illuminate the road sufficiently. Lamps out of focus or brackets bent upward or downward. In case trouble is due to short circuit on some particular lamp socket, disconnect the attachment plug leading to this socket until cause can be repaired.

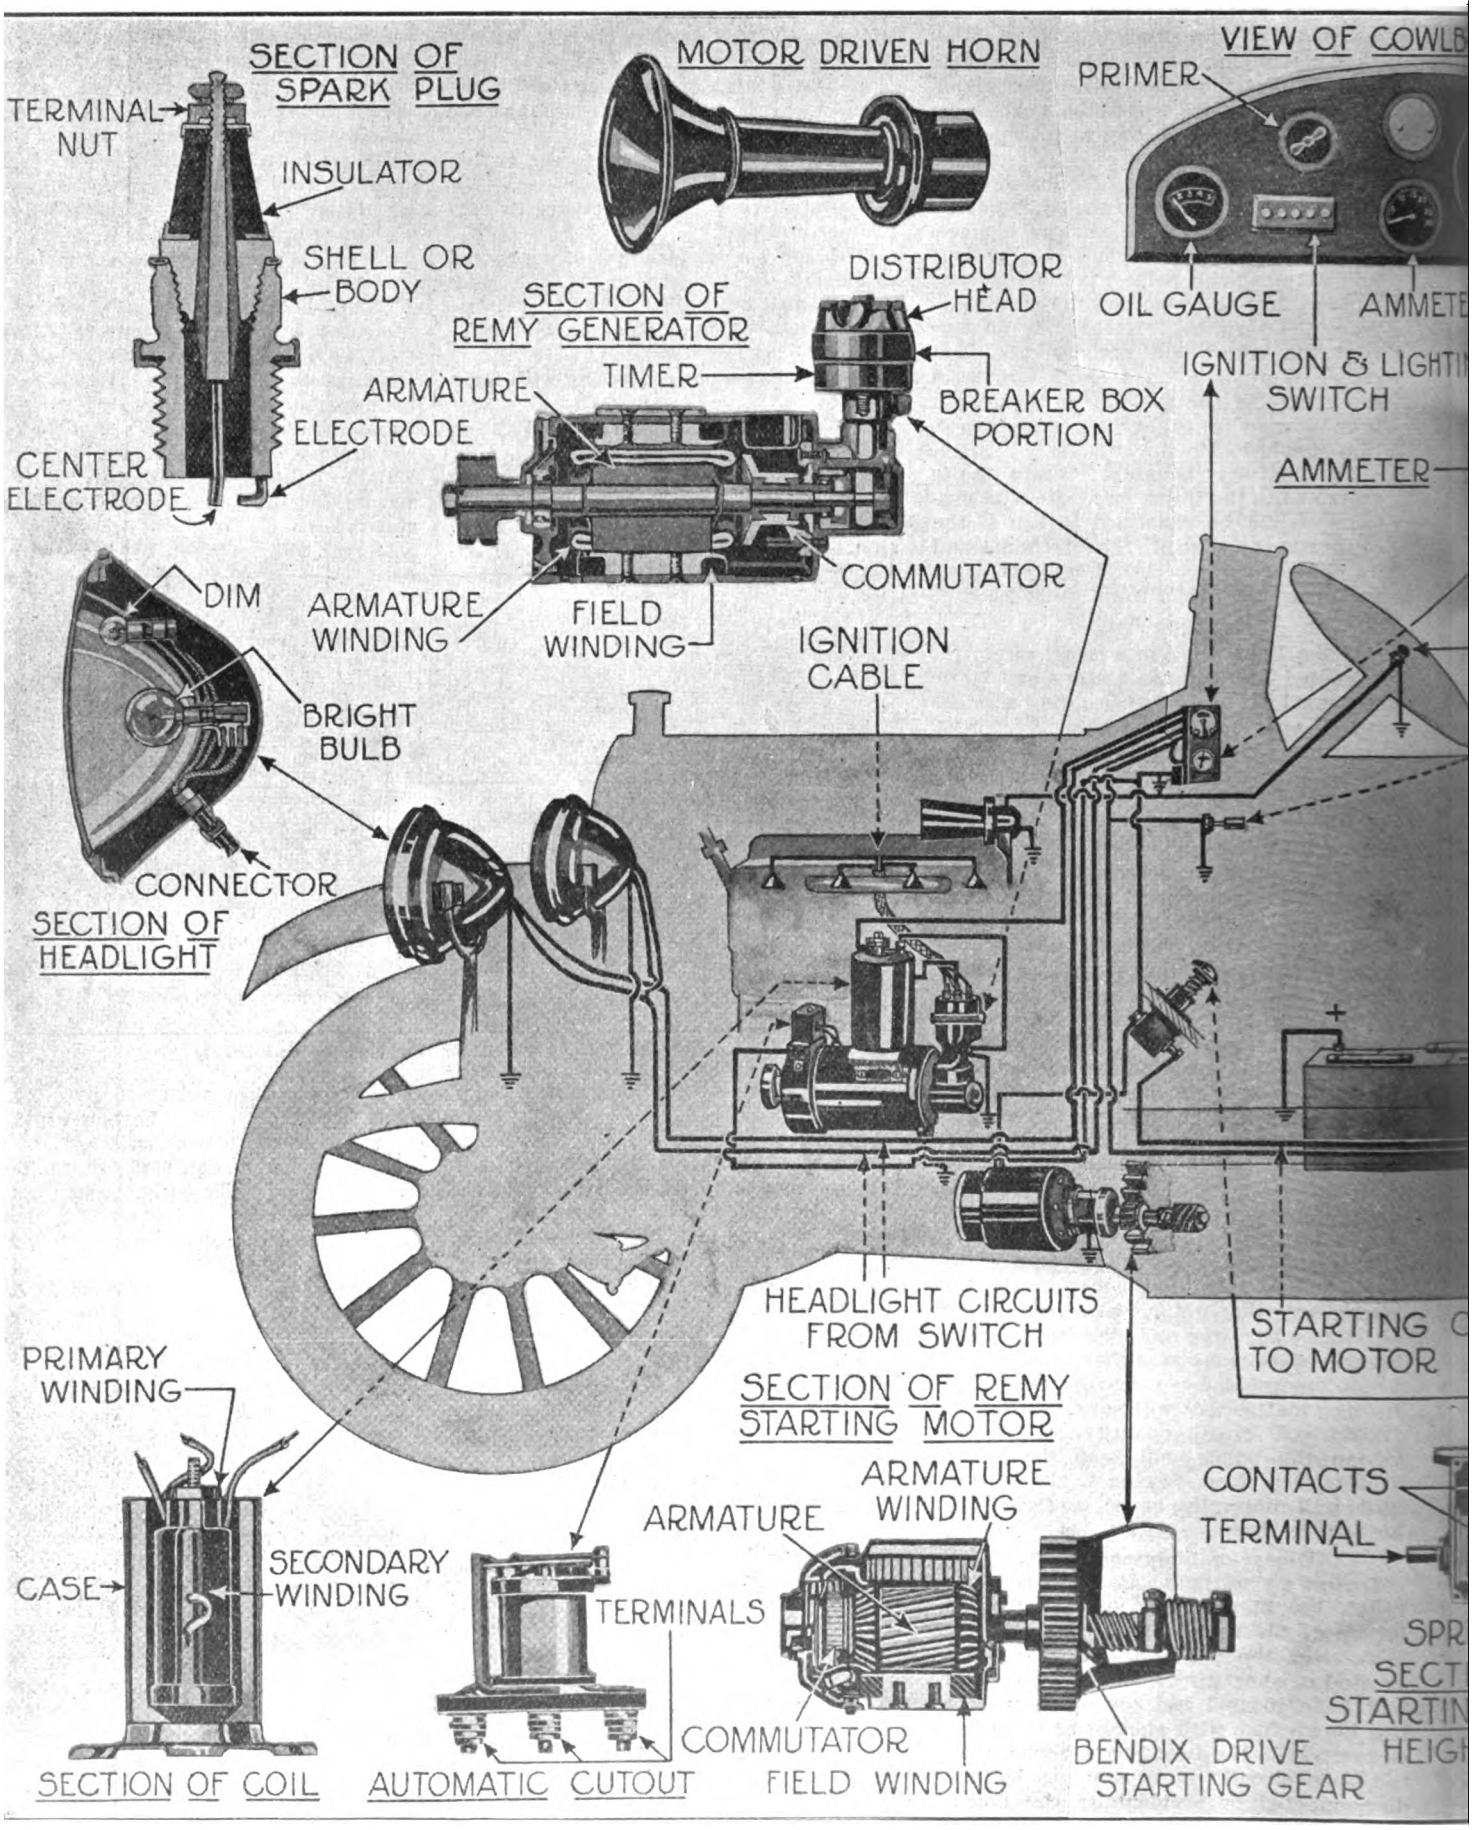
None of the lamps will burn, and no spark is obtained for ignition, may be due to the terminals of the battery being disconnected or corroded, so that contact is poor. Ground wire from the battery to the chassis is disconnected or broken. If the ignition is normal, the cause may be: Lead from the battery disconnected or broken, lead from generator terminal to the fuse block is disconnected or broken, lamps burned out. This is likely to happen from either of the previous causes mentioned, or if the battery is run down. If one lamp burns dim, change the bulb. If the same lamp continues dim, test the wiring to the lamp. Examine the lamp connector.

Lamps flicker. This trouble is usually

(Continued on Page 42.)

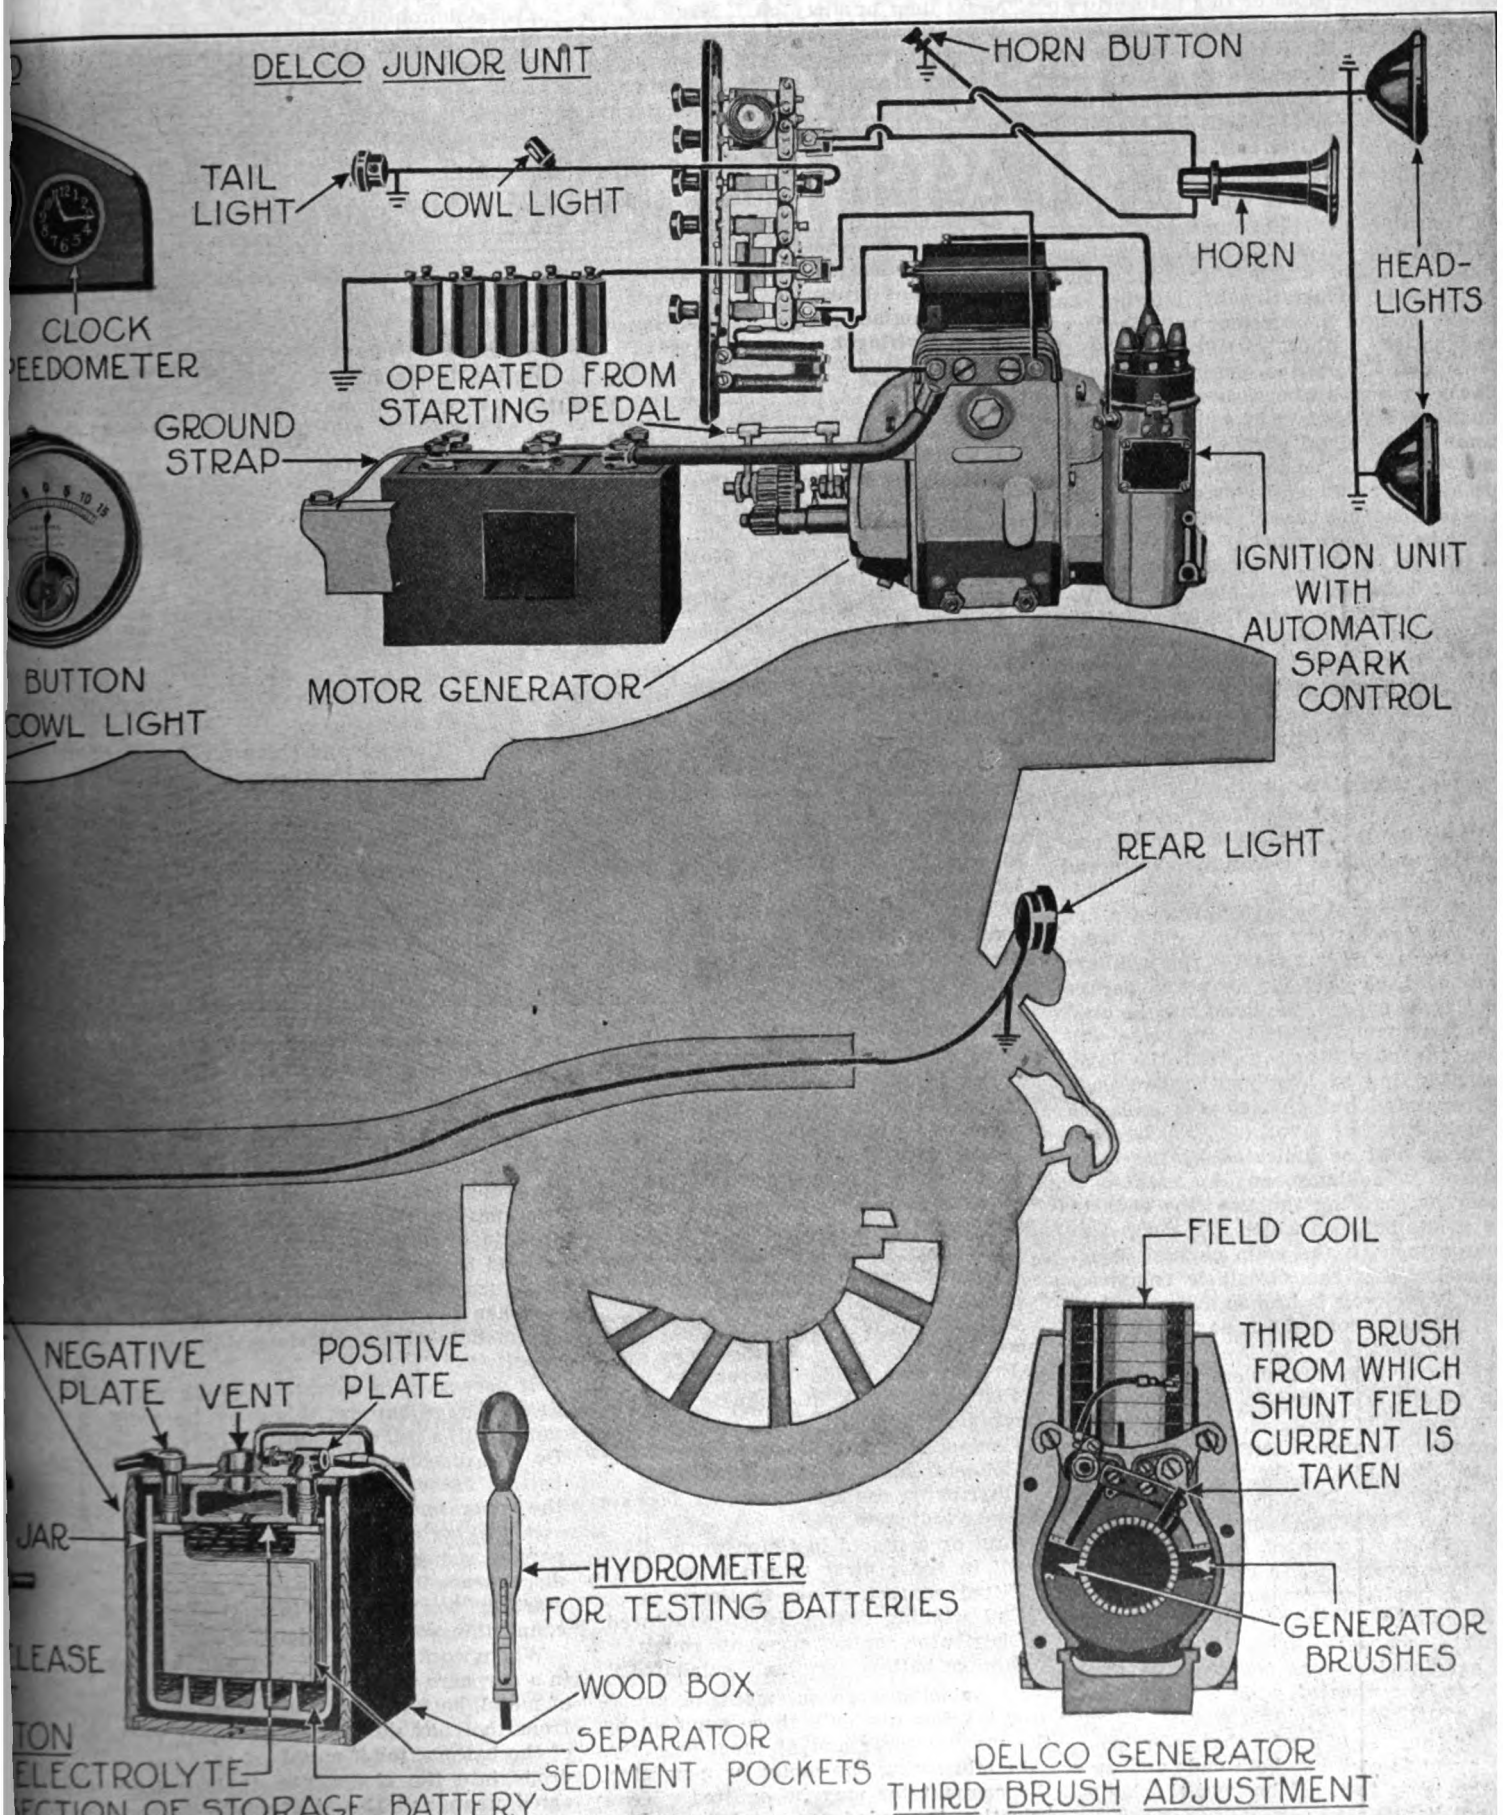
Digitized by Google

Modern Starting, Lighting and Ig



Digitized by Google

tion Systems Used in Automobiles



Digitized by Google

(Continued from Page 39.)

attributed to loose connections. It may also be caused by bad contact or an intermittent ground. Vibration will sometimes cause trouble of this nature to appear. A poor ground connection might be the cause. If all lights flicker instead of one then the trouble is in the generator, or on the main lines running from it, and if only one flickers the trouble is in that individual circuit.

Short Circuits and Grounds.

If the insulation is worn from any one of the wires and the copper touches any of the metal parts of the car, a short circuit will result which will either render the system inoperative by blowing out one or both of the fuses or will discharge the battery. Short circuits may result from two bare wires coming in contact, but in general, where short circuits are mentioned a contact of a bare wire with some of the metal parts of the car is referred to. By "open circuits" is meant broken wires, fuses burnt out, or proper connections not made to the frame. It must be borne in mind that as the frame of the car forms one-half of the electrical circuit between the lamps, the ignition switch and the battery, the frames of the lamps and the terminals of the ignition switch and battery should be well grounded to the frame of the car at all times. In the Delco system, fuses are replaced by a protective circuit breaker which opens and vibrates when any wire is shorted, thus giving a warning.

The Lamp Test.

Probably the simplest and most convenient method of testing for shorts and open circuits is by a test lamp. This may be arranged by making use of a dry cell, storage battery or the regular lighting current. If one side of the ordinary drop cord, as used for shop and garage lighting, is opened, the lamp may be used as a test lamp. Cutting one wire will open the circuit and prevent the lamp from lighting as long as the two ends are separated, but when the two ends are brought together the circuit will be complete, as will be indicated by the lamp lighting. The lamp may be used as a tester by touching the two free ends to any points between which it is desired to make a test. If the lamp glows it is an indication that the circuit is complete, if not, the circuit is broken and a broken wire should be looked for, as an open circuit is indicated.

Proper Caution.

In case it is desired to know whether or not a wire is grounded, one of the test wires may be touched to the frame of the car and the other to the wire to be tested. If the test lamp is lighted it indicates that the wire is in electrical contact with the frame of the car and is therefore grounded. In making the test in a grounded system care should be taken to have the wire or circuit being tested disconnected from the frame of the car in all places where it is supposed to be connected, as in this case the lamp will light if a single connection is left. In the case of a wire that is broken, disconnect the wire at both ends and apply the lamp test. If broken, the lamp will not light.

Trouble.	Cause.	Repair.
Worn or pitted contact segments	Misfiring	Smooth down by grinding
Pitted platinum points	Misfiring	Smooth with oil stone or very fine file
Metal dust or dirty oil	Misfiring	Clean thoroughly
Worn bearing	Misfiring	Renew bearing
Terminals Loose	Misfiring	Tighten
Revolving contact brush	Misfiring	Renew brush
Out of time	Irregular spark	Reset timing gears
Burnt out resistance unit	No spark	Replace with new

INDUCTION COIL.

Defect.	Cause.	Repair.
Loose terminals	Misfiring	Tighten
Defective condenser, defective wiring	No spark	Return to factory
Connections broken	No spark	Renew joints
Switch contact poor	Misfiring	Tighten
Internal wiring broken	No spark	Repair
Coil unit dead	No spark	Return to factory

WIRING.

Defect.	Cause.	Repair.
Loose terminals	Misfiring	Tighten
Broken plug terminal	One cylinder will not fire	Renew
Timer wire broken	Coil will not operate	Try another coil or replace
Broken battery or ground wire	No spark	Replace
Chafed insulation or short circuit	Misfiring	Renew or insulate wire

SPARK PLUGS.

Defect.	Cause.	Repair.
Cracked porcelain	Plug inoperative	New porcelain
Porcelain oil soaked or wet	Plug misfires	Clean plug
Carbon deposits	Plug short circuited	Remove and clean
Porcelain loose	Plug misfires	Tighten bushing
Broken gasket	Lost compression	New gasket
Loose electrode in shell	Plug misfires	Tighten or renew
Loose wire in porcelain	Plug misfires	Tighten
Air gap too close	Spark short circuited	Correct setting
Air gap too wide	Spark will not jump	Set points 1/32 inch apart
Terminal loose	Plug may misfire	Tighten
Loose plug in cylinder	Compression leaks	Tighten
Mica insulation oil soaked	Short circuits plug	Replace

IRREGULAR RUNNING OF ENGINE AND MISFIRING.

Faults of Ignition System.

Wiring or terminals loose.
Spark plug insulator broken.
Spark plug points sooted or oily.
Spark gap at plug points adjusted wrong.
Secondary cable leaking.
Primary wire prematurely grounded.
Battery discharged.
Adjustment of contact points at timer poor.
Broken wire inside of insulation.
Platinum points in magneto loose or improperly adjusted.
Contact spring weak or roller worn.
Collector brush or pencil broken.
Distributor casing or contact breaker dirty or too much oil.
Cam or contacts in timer worn.
Oil in timer dirty or too thick.
Pitted contact points in timer.
Coil winding or condenser punctured.
Distributor contact segments rough.
Storage battery terminals sulphated.

In replacing worn out motor or generator brushes use only those supplied by the manufacturer and fit them properly.

In lubricating the motor or generator, the commutator may be omitted. If lubrication is needed use a small quantity of vaseline and wipe off with a cloth.

In washing the car, cover the engine with a waterproof covering so that the motor and generator will not collect moisture.

Use the starter with care; do not try to propel the car with starter; the engine was put into the car for this work.

Adjustments to the circuit breaker should be made at the factory that manufactured the system.

When the system is operating well do not meddle with it. Serious damage may result.

If necessary to operate the car with a dead storage battery, this may be safely done, till a service station is reached. Do not disconnect the terminals of the battery as serious damage will result to the generator.

In making repairs to the electrical apparatus, especially if it is to be removed, disconnect the storage battery before starting work. Removing the ground connection will be sufficient.

When working over a storage battery in a car, care should be taken that pieces of metal, buttons from your clothes, nails from tool box do not enter open vents of the battery, for if metal of this nature drops into the electrolyte it is quickly acted upon and the electrolyte is soon rendered useless.

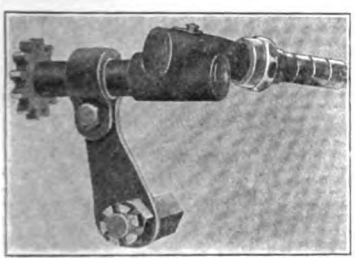
ACCESSORIES, EQUIPMENT AND TOOLS FOR THE GARAGE AND REPAIR SHOP

Standard Speedometer No. 505 for All Models of Ford Cars is a new instrument of the flush dash type that is fitted into the special cowl board supplied by the manufacturer. It is set in a strong steel

case with a nickel flange for fastening it to the cowl board. The odometer is of the planetary type, having a centrifugal governor. The speedometer, it is claimed, is not affected by atmospheric changes or adjoining electrical apparatus. It has a 10,000-mile season register that repeats automatically, 100-mile trip that can be set to zero in a few seconds time and a silver etched dial with large black numerals that are easily read.

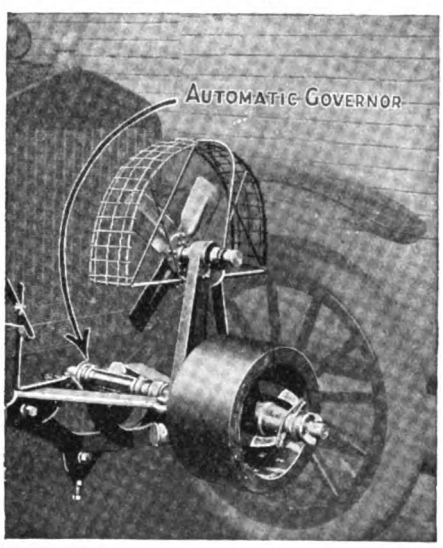


The Standard speedometer is guaranteed, all parts except fiber pinions, against defective material for one year from date of shipment, provided that they are not taken apart or tampered with. Transportation must be paid when returning parts to the factory for repairs.

Manufactured by the Standard Thermometer Co., 65 Shirley Street, Boston. Price, F-505, which comprises the special sedan model No. 205 with angle stem and all fittings for 1919 Fords with starter equipment, $16.

McGill Autopower Attachment for Ford Cars is a power attachment for driving farm machinery of various kinds that requires power within the range of the Ford engine.

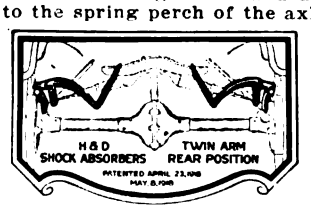
A three-cornered plate is attached to the frame, below and parallel with the radiator, which becomes a permanent part of the car. The attachment is bolted to this plate and consists of a suitable length of shaft that connects with the crankshaft of the engine, the opposite end carrying a friction clutch and pulley supported on a suitable bracket fastened to the permanent plate. The engine is cranked in the usual manner at the end of the length of shaft. After the engine is started the friction clutch allows the engine to pick up its load easily. A fan is mounted above the pulley, protected by a wire screen that supplies air to the cooling system of the engine. This fan is mounted on a standard that is fastened to the front end of the bracket.



The device is equipped with a governor that operates on the throttle of the engine, allowing the engine to supply power according to the work being done.

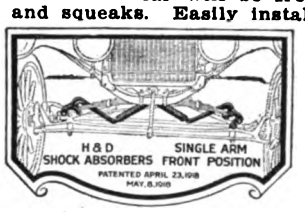
Manufactured by the Knight Metal Products Co., Detroit, Mich. Prices and literature on application.

H & D Ford Shock Absorbers for Passenger Cars or Trucks are manufactured either in twin or single arm and are attached to the spring perch of the axle and



the end of the spring. A coiled spring connects the end of the arm to the body beneath the radiator in the single arm construction. In the twin arm construction two coiled springs are employed, both fastened to the frame member beneath the radiator.

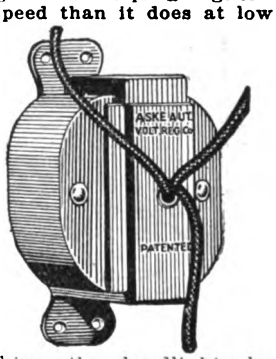
The manufacturer claims that installing a set of H D shock absorbers on a Ford car will greatly improve its riding qualities and that the car will be free from rattles and squeaks. Easily installed by



any one handy with tools in a few hours.

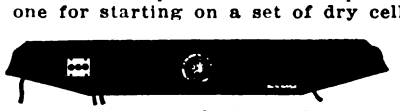
Manufactured by the H & D Co., Inc., Goodland, Ind. Prices on application.

The Aske Automatic Voltage Regulator for Ford Cars is a regulating device that is placed inside the dash of the Ford and automatically regulates the current of the Ford magneto as it is used by the lights. Advantage is taken of the fact that the Ford magneto develops a higher voltage at high speed than it does at low speed,



thus making the headlights burn dim when running slow and very bright when running at speed. The Aske Automatic Voltage Regulator, it is claimed, overcomes this difficulty and is backed up by statements of many users and by experiments carried out by the manufacturer.

The regulator is attached between the magneto and the lights much in the same manner as the regular switch and by means of a switch control, located on a dash board fitted to the cowl, may be dimmed or brightened at the will of the operator. Three pull switches are provided, one for starting on a set of dry cells,



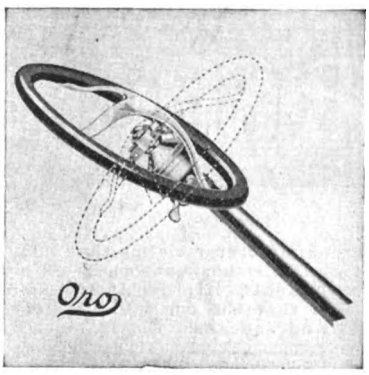
a second for bright lights and the third for dim lights. Use is made of the dry cells for electric lighting the tail light when the car is standing with the engine not running. The regulator and dash board may be attached in a few moments and once installed becomes a part of the car.

Manufactured by the Aske Moore Corporation, Duluth, Minn. Price, regulator, $5. Instrument board complete, $15 including regulator.

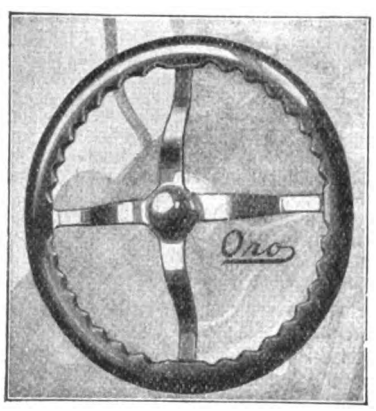
Digitized by Google

The "Oro" Steering Wheel for Ford and Chevrolet Cars, No. 324, has a spider fitting the shaft of the steering column as in the Ford wheel. It is a highly finished, corrugated wheel that may be tilted forward to the plane of the steering column for the convenience of the operator.

The wheel is 17 inches in diameter, instead of 15 inches, as used on the Ford, increasing the steering leverage and allowing the operator more comfort in driving and steering. When the driver is leaving the car the wheel is tilted forward, giving more room. Spider is made of malleable iron, finished in black enamel.



No. 326 wheel is similar to No. 324, but does not have the tilting feature. The spider is of the same material and the finish is black enamel. No. 325 has the tilting spider to which only the ordinary Ford wheel may be attached, giving the tilting effect to the Ford wheel.



Manufactured by the Auto Compressor Co., Wilmington, Del. Prices, No. 324 wheel, complete for Fords, $6; No. 325, tilting spider only, for Fords, $3.63; No. 326, non-tilting, corrugated wheel, complete for Fords, $4.63; No. 402, non-tilting, corrugated wheel for Chevrolet cars, $4.63; No. 403, non-tilting spider only, for Chevrolet cars, $2.25.

Emo Transformers consist of a small condenser like attachment that is placed at the terminal of the spark plug where the wire terminal usually attaches, this wire terminal being attached to the terminal of the transformer instead. Current in this manner is led into the transformer where, by means of a condenser like arrangement, the electricity is made to cross a space where there is no conductor, forming a vacuum in its passage.

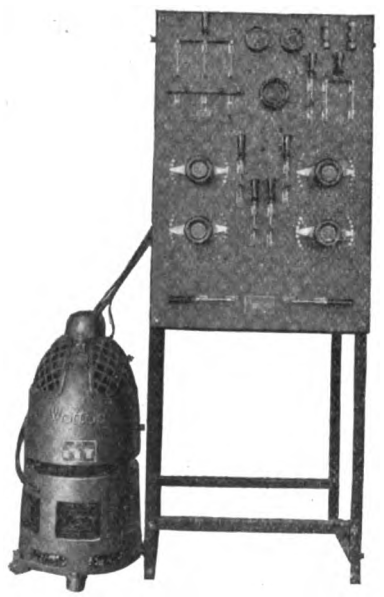
This jumping of the gap has a tendency

to raise the potential of the current to a somewhat higher voltage, so that the current upon reaching the tip of the plug at the spark gap at the points gives off a heavier and more intense spark. This is particularly desirable where the current is of a weak nature.

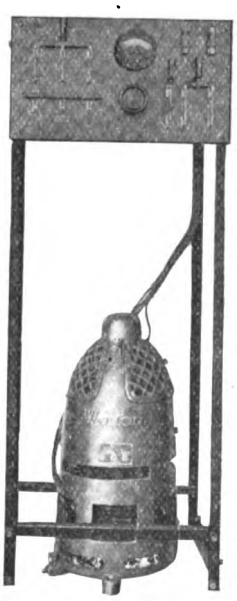
The manufacturer claims that the spark delivered is an intense blue white flash that keeps the plug points free from carbon, soot and oil, prevents bucking and loping of the engine, especially at low speeds, and that after a complete set has been installed the gasoline mixture may be made much leaner by shutting down the gasoline feed at the needle valve.

Manufactured by the Emo Laboratories, 2255 N. Illinois Street, Indianapolis, Ind. Price $1. Special dealers' proposition.

Wotton Vertical Motor Generator Type KS-12-20 is of the single charging circuit type, having control switches for the incoming and outgoing current, rheostat and ammeter for the charging current. One charging circuit is shown, but others may be added as business increase warrants. As many different charging rates as are desired can be obtained by grouping the batteries on the bench.



Each individual charging rate, if more than one is desired, requires an extra wall rheostat. All types of the Wotton motor generator charging sets are built on the vertical type except the smallest type HS-12-8, which has a capacity of 12 lead cells. This type has been developed for the beginner in the charging business and is not especially adapted to larger installations. Wotton motor generators convert alternating current at line voltage into direct current at battery voltage. Thirty-two, 55 and 110 volts are the standard voltages for charging batteries, the lowest voltage being ample for the largest battery and the regulation is such as to charge the smallest battery without useless waste of current, the manufacturer claims.



Manufactured by the Electric Products Co., Cleveland, O. Prices and literature on application.

Chauffeur's Hand Soap is used principally for removing grease from the hands of repairers or operators of automobiles. The maker states that it is made from the purest and best of materials, is non-injurious to the skin and leaves the hands

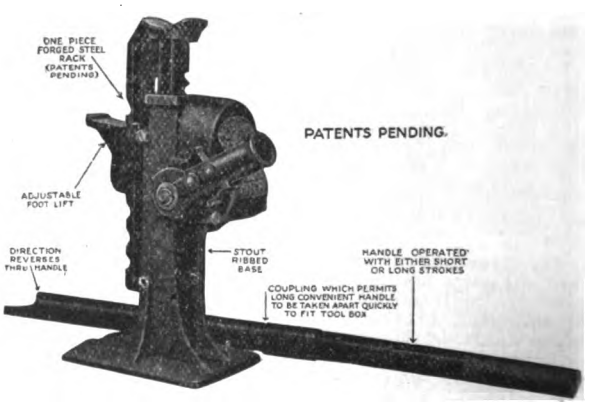
smooth and pliable after use. It is claimed that it will remove all grease and grime. The soap is packed in individual cartons, 100 to the case.

Manufactured by the Decatur Union Chemical Co., Decatur, Ill. Prices on application.

The New Duff Universal Automobile Jack is manufactured in a 1½ ton size only, which is ample for all passenger cars. The jack is operated by as long or as short a stroke as desired and with the operating handle inclined at any angle, a feature desirable in the case of cars having gasoline tank, tires or other obstructions in the rear.

The Duff jack may be either raised or lowered, without reaching under the car, by simply turning the handle half way round. To raise the operating handle is inserted in the socket with the side of the operating handle marked "raise" in the up position. To lower, the operating handle is withdrawn until it disengages the operating mechanism, but still remains in the socket, and is then turned half way round with side marked "lower" up. A spring maintains the socket in a raised or horizontal position so that the operator may insert the handle without bending down to adjust the socket.

By means of an adjustable foot lift this jack may be instantly made to fit under the lower axle of any car. The range of adjustment varies from four to 18 inches and is wide enough to handle any car in any position on or off the road, the manufacturer states.



The operating handle is twice as long as the ordinary jack handle, making it easy to operate on account of the greater leverage. The long handle easily clears all obstructions at both front and rear of the car. When not in use the long handle uncouples for half its length, easily fitting into the smallest tool box.

Manufactured by the Duff Manufacturing Co., Pittsburgh, Pa. Sold through jobbing houses. Literature and prices on application.

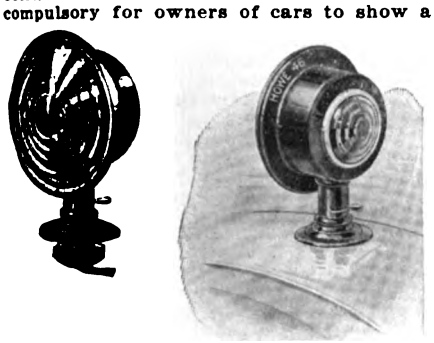
The Howe No. 46 Parking Light consists of a single lamp, placed on the rear left fender and lighted direct from the storage battery of the car. When the car is parked at night the owner may turn out his head lights and tail light and turning on the switch of the Howe Parking Light, have a light that will show white in front and red in the rear.

It may also be applied to buggies or wagons and lighted from a set of dry cells. The laws of some states make it compulsory for owners of cars to show a



red light in the rear and a white light in front when cars are left standing on public streets or in a public parking space at night.

The outfit includes a switch in the support of the lamp, three feet of water proof wire and a six-eight volt, two candlepower bulb. The face of the lamp is 3¾ inches in diameter. The lamp is made of steel and finished in black enamel. The entire weight is one pound. Packed in individual cartons, 50 to the shipping case.

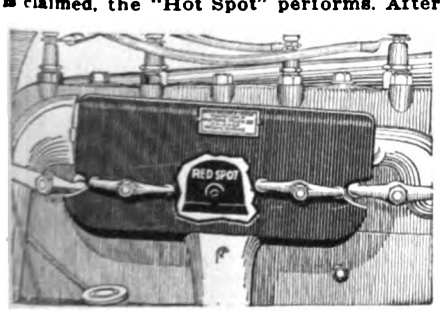
Manufactured by the Howe Lamp and Manufacturing Co., 115-123 E. Ontario Street, Chicago. Price, $2.50.

"Tinol" Tinning Stick" is a new form of solder and flux combined. When the stick begins to melt it deposits a film

of tin which enables the solder to flow freely. It may also be used for all kinds of tinning work without the use of solder. It is non-corrosive and will answer the purpose of radiator repairers and others in the automotive industry using solder and flux.

Manufactured by Hess & Son, 2910 N. 10th Street, Philadelphia. Prices on application.

The Red Spot or Hot Spot for Ford Cars and Trucks consists of a patented device that is attached between the intake and exhaust manifold of the Ford engine. The maker states that the gasoline today is of a poor grade and to get the utmost power out of it the gasoline must be warmed before entering the cylinders. This duty, it is claimed, the "Hot Spot" performs. After



the "Hot Spot" is positioned, it is covered by a metal cover fitting over the exhaust manifold and inlet manifold. The heat of the exhaust manifold is thus retained and helps still further to warm the entering gas.

The manufacturer claims that its use will make a Ford act similar to a six, in traffic, or on the hills, delivering from 35 to 80 miles more from every tank full of gasoline used. It is claimed that the "Hot Spot" during cold weather will keep the intake manifold warm, insuring easy starting of the engine. It may be attached by anyone in a few moments simply by loosening two nuts and fitting the "Hot Spot" in place. It is guaranteed on a money back basis.

Manufactured by the Axleford Truck Co., 7311 Crandon Avenue, Chicago. Price, $5.

Clover Grinding and Lapping Compounds are put up in four-ounce and one-pound cans, with two grades, grade A being used to polish the surfaces and insure a perfect contact and grade C to seat the valve.

The manufacturer claims that Clover grinding compounds contain the best abrasive and grease binder that money can buy and that emery is not used for the abrasve material.

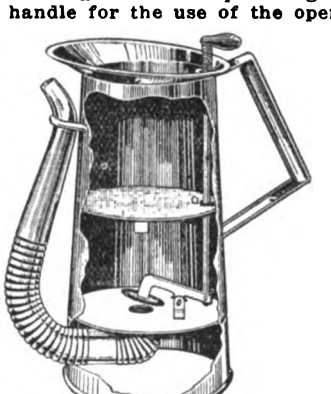
The four-ounce can is a convenient size for the motorist or garage man who wishes to give Clover grinding compounds a trial, while the one-pound can is more convenient and economical for the service

station that has decided to use this brand in valve grinding and piston lapping work.

Seven grades are manufactured: 1-A (very fine), A (fine), B (medium fine), C (medium coarse) D (coarse), E (very coarse) and No. 50 (extra coarse).

Manufactured by the Clover Manufacturing Co., Norwalk, Conn. Prices and literature on application. Special terms to manufacturers.

The All-in-One Liquid Measure is a container having a flexible spout and a valve connected to a suitable trip arrangement at the handle for the use of the operator



in putting oil into car engines. It is made throughout of the best of material and has either a copper or tinned finish as the purchaser wishes.

The flexible spout is lifted up out of the way after using and is held in this position by a small hook on the front of the measure at the top. It is claimed that this device is very handy for the garage or service station, as much of the trouble of supplying oil to autoists is eliminated.

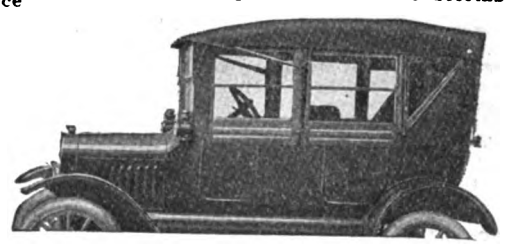
Manufactured by the Dayton Iron and Steel Co., 119 East Third St., Dayton, O. Price, one-half gallon, coppered, $3.50; one-half gallon, tinned, $3.25.

Ustus Limousette for Ford Cars is an attachment for converting the regular top of the Ford touring and roadster into a closed top for winter use. It consists of the necessary sections equipped with slides for attaching to the windshield and bows and curtains of the roller type, fastened at the top as in an ordinary window curtain and made of heavy rubber fabric, with DuPont Pyralin windows inserted in the side.

The curtains may be rolled up out of the way for summer driving and drawn down for winter driving, the sides of the

curtains fitting the slides of the bow and windshield sections so that the curtain is prevented from working loose or blowing open.

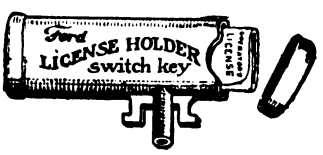
The curtains and sections are easily installed by one handy with tools in two hours without mutilating or altering the present top. After once installed the fixtures become a permanent part of the top, protecting the operator from the storms



of the winter months. A clear range of vision is provided by the use of Pyralin windows in the curtains, giving the operator an unrestricted view on all sides. It is claimed to be wind and rain proof at all points, and improves the general appearance of the car.

Manufactured by the Dufoe-Eustice Co., Inc., West Jefferson Ave., Detroit, Mich. Price, touring car, $46; roadster, $30; f. o. b. Detroit. Duty added for Canadian prices.

License Holder and Key for the Ford Car Switch is a metal container for the driver's license and a key for the Ford switch, combined in one article. The container



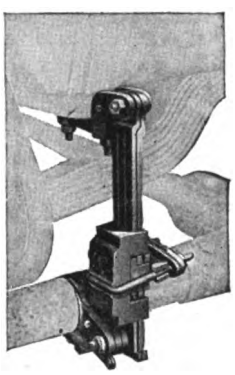
is made of metal, finished in polished nickel, having a pressed on cap. The container is of ample size for the license when folded and makes a neat, convenient carrier. It is small enough to be carried in the vest pocket when not in use as a switch key and when used as the switch key is not too large to be cumbersome. Put up on neat display boards for the jobbing trade.

Manufactured by the Metal Specialties Co., Attleboro, Mass. Price, 50 cents each.

Digitized by Google

The National Shock Absorber consists of a simple arrangement that is attached to the axle housing at the bottom and the side of the body at the top. The device is composed of two blades, slightly thicker at the top than at the bottom, suspended from the body hanger by a hinged joint and passing between clamps and rollers that offer more or less friction to the passage of the blades. This friction is adjustable by means of two nuts at the side fastened to a clasp. The clamp and rolls are fastened to the axle support by means of a hinged joint.

The device is easily applied to a Ford car in a few minutes and is adjustable to the weight of the car by turning the two nuts at the side of the clamp to tighten

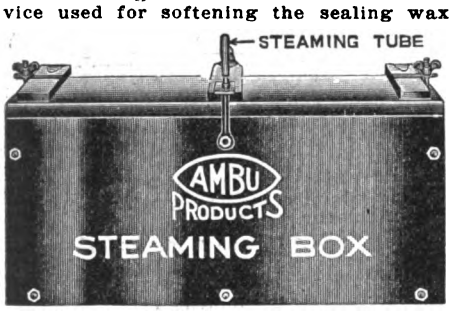


the friction exerted upon the bars or loosening the nuts to make the friction less.

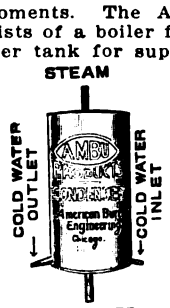
The manufacturer claims that its use will greatly increase the comfort of riding over rough roads and the life of the car, and that the strain on the running gear and tires will be reduced.

Manufactured by the J. S. Lang Engineering Co., 5 Park Square, Boston, Mass. Price, Ford equipment, set of four, $30; set of two, $18; equipment for other cars up to 2400 pounds, set of four, $42; set of two, $24; all extra fixtures for attaching to the car included. In ordering mention the make of car, year and model.

The Ambu Battery Steamer, Condenser and Steaming Box is a steam heated device used for softening the sealing wax



on the top of storage batteries, allowing the removal of the cells and their elements in a few moments. The Ambu battery steamer consists of a boiler for producing steam, a water tank for supplying water

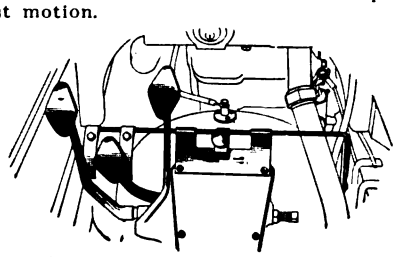


to the boiler and a steaming box in which the battery is placed. An automatic inlet valve keeps the level of the water in the boiler at one inch. When used with the Ambu condenser ½ to ¾ gallons of distilled water per hour is obtained. The Ambu steaming box allows the battery to

be immersed in a bath of hot water, which greatly facilitates the softening of the sealing compound.

Manufactured by the American Bureau of Engineering, 1601-1603 S. Michigan Avenue, Chicago. Prices, complete outfit, $25; with condenser for distilled water, $35; condenser alone, $12.50.

Speederator for the Ford Car consists of a cross rocker shaft located behind the foot pedals and supported by a bracket as shown in cut. On the shaft are two fingers immediately behind and in connection with the slow speed and reverse pedals, the position being such that a movement of either pedal rotates the rocker arm shaft. Rotation of the shaft opens the carburetor valve by means of a vertical arm on the shaft and a connecting rod to carburetor. A spring tends to keep the carburetor valve closed and takes up all lost motion.



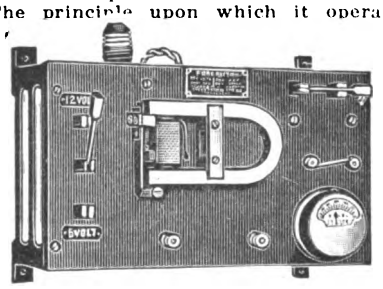
The foot throttle used for operation on high speeds is clamped to the center of the cross shaft and projects through the finger hole in the floor boards in such a position that the right foot pivoting on the heel in normal position may be conveniently brought to operate the foot throttle. A special pull rod is supplied with the device, to be used in place of the regular pull rod. This rod connects with the arm on the present steering post throttle shaft and the carburetor valve, giving a link motion.

It is claimed that racing of the engine is eliminated by this device when using the low or reverse gear and that stalling of the engine is an impossibility. The Speederator is easily attached by any one handy with tools in a few minutes.

Manufactured by the Versal Products Manufacturing Co., Detroit, Mich. Price, $4.85.

The Fore Rectifier Type 2-B has a capacity of 12 volts and will charge both six and 12-volt batteries from an alternating current line. It may be used with direct current when suitable additional apparatus is purchased.

The principle upon which it operates

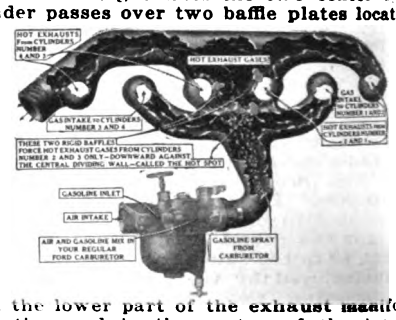


is that the current alternates; that is, for one cycle it flows in one direction and during the next cycle it flows in the opposite direction. A rectifier is made to take advantage of this change in cycles, but operates on only one of the cycles, in this manner charging the battery in one direction at all times. Regardless of the manner in which it is connected to the alternating current line, it picks the proper cycle and charges from this till the battery is fully charged, reducing the charging rate automatically as the battery approaches full charge.

The manufacturer claims that a battery may be attached at night and left on charge till morning without harm to the battery, as the automatic control will care for the rate of charging. Other sizes are also manufactured up to 220 volts.

Manufactured by the Kentucky Electrical Co., Owensboro, Ky.

Anco Evenheat "Hot Spot" Manifold for Ford Cars is a device that takes the place of the regular intake and exhaust manifold on the Ford engine. The Anco manifold casting is in one piece and it receive its name, "Hot Spot," from the fact that the exhaust gas from the two center cylinder passes over two baffle plates located



in the lower part of the exhaust manifold section and in the center of the intake manifold. The inrushing fresh gas comes in contact with this hot metal surface, warming the gas before entering the cylinders.

The result of the use of this manifold is claimed by the manufacturer to be a smoother running engine, developing more power and increased mileage. It is further claimed that the raw gas entering the intake manifold encounters the heat from the exhaust at this central point and that the particles of gas are broken into a mist that is consumed to better advantage when fired in the cylinder.

Manufactured by the Anderson Co., South Bend, Ind. Price, including instructions for installing, one in a box, $9.75.

"Zip" Cementless and Heatless Patch for Inner Tubes is sold in sheet form, ready for use. It consists of a rubber composition, coated on one side with a cement preparation and covered with gauze. When needed for use, a section is cut from the strip of the desired size, the gauze is taken from the cemented surface and gas-

oline applied to moisten the cement. When the gasoline evaporates the patch is applied to the puncture on the tube. Pressing the patch firmly in place is all that is necessary, the manufacturer claims, as the tube may be immediately inflated and the patch will become vulcanized to the tube by the heat of the road, with the tire in service.

Manufactured by the Baker & Lockwood Manufacturing Co., Kansas City, Mo., 3021 Michigan Avenue, Chicago; 173 Kent Avenue, Brooklyn, N. Y. Prices on application. Money back guarantee.

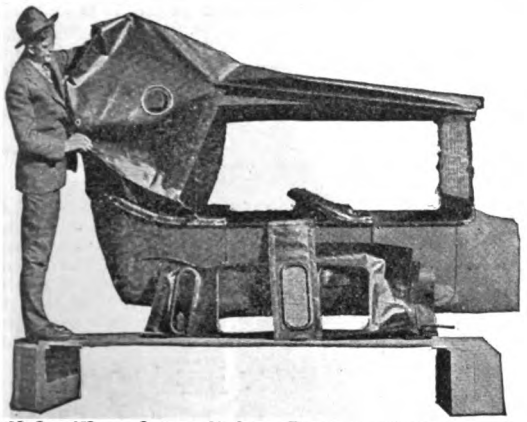
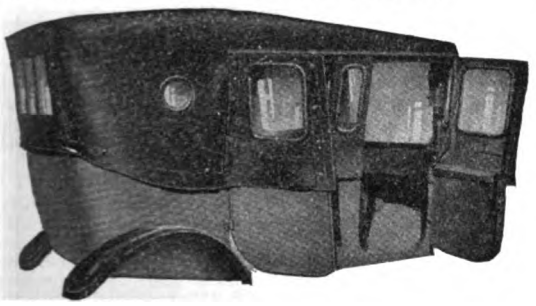
Baker "Over-the-Top" Auto Top is a patented device for converting the regular top of many passenger cars, including the Ford, into a closed car for winter use. It consists of a covering of extra heavy artificial leather that is applied by fitting it over the old top now on the car. It has three lights in the rear curtain and a single round light at each side. Special side sections are supplied for the doors and the section between the doors, each provided with a large light. Door sections fasten to the top of door by a strap iron and swing open with the door. It is made for the following cars:



Class one, Ford touring and roadsters only, special with all celluloid windows; regular with all glass windows, except over right front door.



Class two (1917, 1918, 1919 models only), Buick, D, E and H, 34-35-44-45; Chevrolet, Dodge, Dort, Hupmobile, Maxwell, Oakland 32, Overland 75-83-90, touring and country club models.

Class three, Buick E and H 49; Essex, touring only; Hudson, speedster and touring; Nash, touring only; Oldsmobile, four-passenger, sport and touring; Overland 85, four and six-cylinder; Reo, Studebaker, touring only.

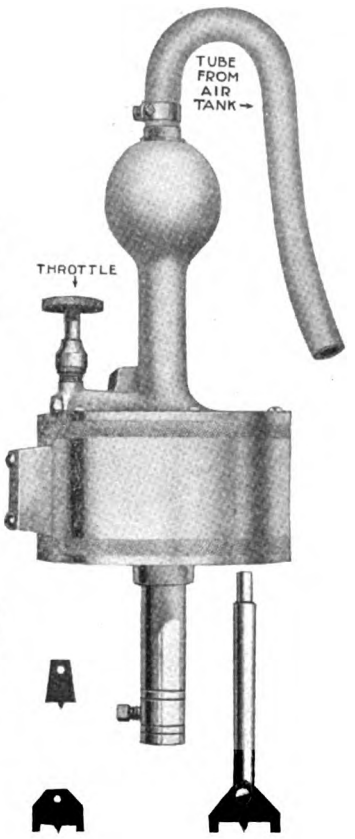
Patterns for other models will be ready very soon.

Manufactured by the Baker & Lockwood Manufacturing Co., Seventh and Wyandotte Streets, Kansas City, Mo.; 473 Kent Avenue, Brooklyn, N. Y., and 3021-23 Michigan Avenue, Chicago. Prices and literature on request.

Norwesco Iron Cement is a new product which the manufacturer claims will permanently repair cracks, blemishes and sand holes in iron and steel castings and leaks in radiators, boilers, steam, hot and cold water pipes, threaded joints, etc. It is made in powder form and manufactured under strict laboratory supervision, which insures a standard quality that will give the desired results.

Norwesco Iron Cement is put up in cans of three sizes, six ounces, one pound and five pounds. When mixed with water and applied according to directions repairs may be made at small expense.

Manufactured by the Northwestern Chemical Co., Marietta, O. Prices on application.



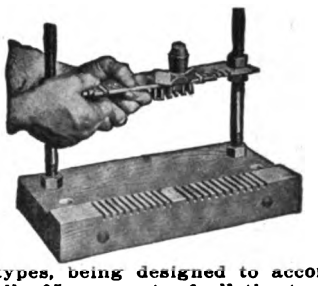
Veltum Pneumatic Valve Grinder is a new tool for the repair shop and service station that differs from the regular run of tools for this class of work in that air is used for the source of power instead of electricity.

In the Veltum Pneumatic Valve Grinder the operator has complete control of the speed of the tool from 50 to 1000 strokes per minute at an air pressure of from 15 to 500 pounds of air taken from any source of supply that one may now have. The maker states that it is possible to do the entire job of grinding, using low speed for preliminary grinding, intermediate grinding at high speed and finishing at low speed.

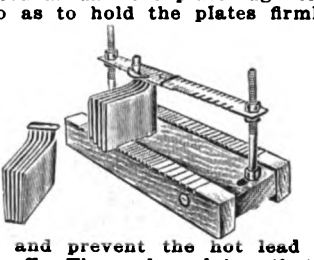
The manufacturer states that this tool will grind any size valve, fit over any size valve stems into valve guides and is capable of handling delicate work, such as grinding carburetor float valve stems and fuel system valves. All castings are of aluminum, which gives the tool unusual lightness.

Manufactured by the Warnock-Worth Co., 624 S. Michigan Avenue, Chicago. Price, $22.50. Sold only through the jobbing trade.

Ambu Plate Burning Racks are to be used when burning-in battery straps to plates or burn-in new plates. The racks have guiding slots cut in the base and in the iron bar, or comb at the top. In this way the plates are held at exactly the right distance apart both at the top and bottom. Bases are made of hard wood. The small rack is large enough to take care of practically all ⅛-inch plates made by Willard, Gould, Philadelphia and U. S. L. It will also accommodate all thin plates such as the Exide 3xC, Willard and Gould. The large rack will take care of many other types, being designed to accommodate fully 95 per cent. of all the types of plates which are made.



Special iron fittings are furnished, which are placed around the plate lugs on the comb so as to hold the plates firmly in position and prevent the hot lead from running off. The maker claims that this device enables the operator to burn-in plates in half the time required when using the ordinary rack.



Manufactured by the American Bureau of Engineering, 1601-1603 S. Michigan Avenue, Chicago, Ill. Prices, small rack, $7.50; large rack, $12.50.

Baker Hood and Radiator Covers for All Cars Except Fords are manufactured from three grades of material, enameled drill, enameled duck and artificial leather, and in three sizes—class number one for small cars, class number two for all medium size cars and class number three for very large cars. A line of radiator covers for commercial cars and trucks is also manufactured, as well as a special line for the Ford car.

The covers are so made that the shutter at the front may be rolled up only half way or all the way, exposing the top alone to the air and leaving the bottom covered or open all the way as desired. They fit the engine from the dash to the radiator, including the radiator, or may be purchased for the radiator alone.

Manufactured by the Baker & Lockwood Manufacturing Co., Kansas City, Mo., 3021-23 Michigan Avenue, Chicago; 473 Kent Avenue, Brooklyn, N. Y. Prices on application.

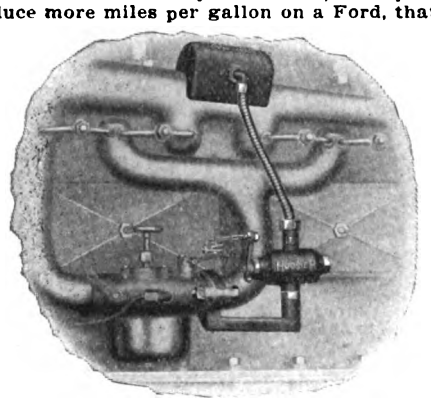
The Hoosier Sub-Carburetor is a heating device that is attached to the manifold flange adjoining the carburetor. A suitable valve is provided in a separate cylinder, operated by the pull rod that opens the throttle, controlling the flow of warm air. Connection is made from the top of the device to a stove securely fastened over the exhaust manifold, allowing the heat of the exhaust manifold to pass through a connecting pipe to the valve and through this valve to the intake manifold, where it enters with the gasoline passing to the engine cylinders.

The purpose of the device is to admit the warm air ahead of or with the gasoline, allowing the engine to operate on a lean mixture, the amount of heat admitted depending on the opening of the throttle and the speed of the engine.

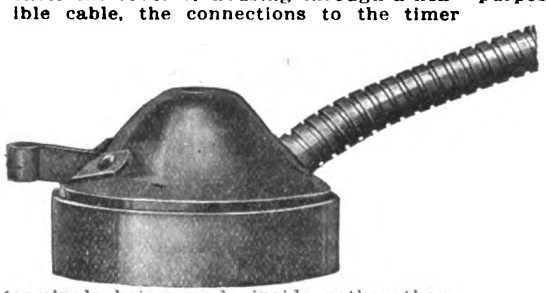
The manufacturer claims that this device is mechanically automatic, will produce more miles per gallon on a Ford, that



the formation of carbon in the cylinders will be reduced and that starting of the engine will be greatly facilitated. It is easily installed by any one handy with tools. Installations are also shown on other make of cars which require special fittings.

Manufactured by the Hoosier Sub-Carburetor Co., Indianapolis, Ind. Prices, Ford, $10; Maxwell, Dodge and other four-cylinder cars, $11; Premier, Studebaker, Buick and other six-cylinder cars, $12; Cadillac, Packard and other eight and 12-cylinder cars, $14. Thirty days free trial.

The Yankee Timer for Ford Cars departs from the usual Ford timer construction in that a swinging arm brush contact is employed instead of the conventional roller rotor. The cover is constructed in two sections, fitting tightly together and forming a compact unit. The terminal wires enter the cover or housing through a flexible cable, the connections to the timer



terminals being made inside rather than outside, as is the custom. This construction prevents oil collecting on the wires,

eventually short-circuiting them and rendering them useless, the manufacturer states.

The sliding contact brush of the Yankee timer revolves over the flat surface of a fiber disc in which contact terminals are imbedded and perfectly machined leveled. The manufacturer claims that wearing and jumping over grooves and irregularities are eliminated and that the ignition is greatly improved. Oil or grease is not required in a timer of this construction as the contacts are made by a brush or sliding contact.

Manufactured by the International Metal Manufacturing Co., Wayne Junction, Philadelphia, Prices and literature on applica-

---

The Howe Safety Tail Light is attached to the rear lamp hanger in much the same manner as the ordinary rear lamp, but combines a rear danger light with red glass and a brilliant white light for driving when in reverse, showing the operator what is behind him. The light is especially convenient when backing up or turning around on a country road at night. The light is thrown off and on by a switch located near the driving seat, the switch controlling the white light, the rear light being operated from the regular lighting circuit. The lamp gives a brilliant white light for 50 feet back and the full width of the road. One push of the switch throws on the light and the second push throws it off.

The lamp is finished in black enamel and comes complete with bulbs, connectors, etc., and is packed in an individual carton with full instructions and wiring dia-

gram for attaching.

Manufactured by the Howe Lamp and Manufacturing Co., 115-123 E. Ontario Street, Chicago. Price, No. 40, $4.50; west of Colorado, $5; in Canada, $6.75.

Adpasco Treated Gasket Paper is treated with a compound, making it a very useful paper packing for general use in garages and repair shops. It is suitable for all purposes and for all joints in automobiles

excepting joints in direct contact with extreme heat. It is claimed that Adpasco is water proof.

Tenax Sheet Packing is tough, compressed asbestos fiber sheet that is claimed to withstand temperatures up to 1200 degrees Fahrenheit and 250 pounds steam pressure. Will not squeeze out of joints and will pack a joint perfectly tight.

Manufactured by the Advance Packing and Supply Co., 11-15 N. Franklin Street, Chicago. Prices on application.

The L & L One-Piece Slip On Lining embodies a new idea in Ford transmission and brake linings and has just been placed on the market by the L & L Automobile Accessories Corporation of Hartford, Conn. Instead of adhering to the old three-piece principle, that is, a separate lining for each band, the L & L is made in one piece.

The maker states that the advantages of a one-piece lining over the three-piece ones are numerous. Most important is the saving of time and labor. It requires

about 3½ hours to put in an ordinary transmission and brake lining. The L & L one-piece goes on in less than one hour, and after the first one has been put in the succeeding ones require only about a half hour's time to attach.

Another decided advantage of the L & L is that no rivets or new felt gaskets are required when installing. It is even unnecessary to remove the transmission cover to put one in after the first one has been attached.

L & L linings do away entirely with all chatter and vibration and will not glaze or stick. They are made of the very best material and retail for $3.

From the many advantages claimed for the L & L one-piece lining it will no doubt be warmly welcomed by Ford owners, garages and repair men.

Manufactured by the L & L Automobile Accessories Corporation, 135 Church St., Hartford, Conn. Dealers and others desiring further information should write to the corporation.

The Apco Combination Muffler and Cut Out for Ford Cars is made from a one-piece gray iron casting with the valve and attaching bracket malleable. The valve

is held closed by twin springs, which prevent leakage of gas, and the valve is guaranteed by the manufacturer not to stick.

When open the valve gives a full, clear opening for the exhaust and a skipping cylinder may be instantly detected. The installation is very simple and may be done by the owner with an ordinary wrench in 15 minutes, it is claimed.

Manufactured by the Apco Manufacturing Co., Providence, R. I. Price, $5.

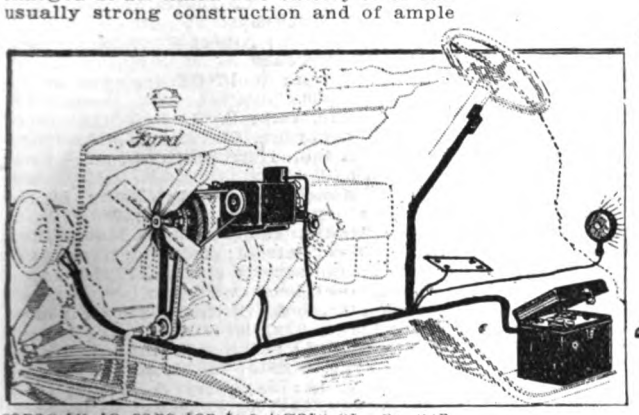
Titan Electric Lighting System for Ford Cars consists of a generator, cut-out, battery and battery box, tail light, two headlight bulbs and special attachments. Special Ford attachments consist of generator bracket, complete wiring assembly with switch, pulleys, belts, bolts and full instructions for installing in the car.

The generator is two-pole, shunt wound, with ball bearings, and is provided with a third brush for regulating the output. A simple, reliable cut out relay is mounted on top of the generator, making a single unit of the two. The output of the generator is sufficient to keep the battery charged at all times. The battery is of unusually strong construction and of ample

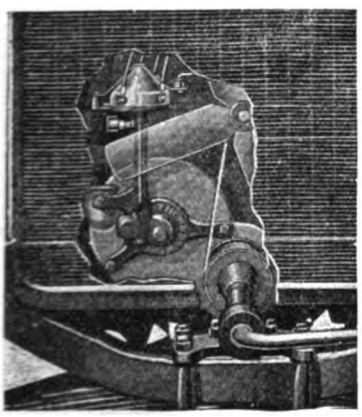


capacity to care for the lights of any car.

The wiring assembly is complete in itself and takes the place of the original wiring for the lights. The switch is mounted on the under side of the steering column next to the wheel and is provided with two push buttons, one of which throws the lights on while the other is used in dimming the lights, and they are within easy reaching distance.

Manufactured by the Titan Engineering Co., Union City, Ind. Price on application.

The Thomas Timer Elevator consists of a suitable bracket or housing and the necessary drive shaft and bevel pinions attached to the end of the camshaft of the Ford engine, and elevates the timer to a vertical position, where it is protected from dust and mud. The Thomas Timer Elevator is installed in a short time and allows the placing of the wires from the coil to the timer in an overhead position,



where they will be free from oil. The timer is placed in a more accessible location and may be repaired to better advantage.

Lubrication for the drive shaft is provided by means of a compression grease cup, placed below the timer case. It is claimed that elevating the timer in this manner will eliminate many of the troubles to which the Ford timer is subject. The Timer Elevator will fit any Ford car, truck or tractor and may be installed without removing the radiator.

Manufactured by the Thomas-Andrews Corporation, 624 South Michigan Avenue, Chicago, Ill. Factory, Waukegan, Ill. Price, $3.50.

The Ab-rec is a device that enables the motorist to charge a 6, 8, 12, 18 or 20-volt storage battery from an alternating current circuit. The Ab-rec will pass a current of about two amperes charging a six-volt battery. When charging a higher voltage battery the current will be somewhat less. The charger is operated by screwing a plug into a lamp socket, connecting two wires to the battery and turning the socket button.

The outfit is automatic in operation, as there are no regulating appliances. An ampermeter is not included, although the

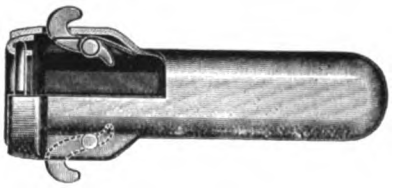
manufacturer recommends its use and sells it as an extra. The device, it is claimed, cannot be burned out regardless of whether one is charging a 6, 8, 12, 18 or 20-volt battery. After long service, usually a year for a private owner, two small electrodes will be consumed and a change of fluid will be necessary. The fluid is made by dissolving in pure water a powder, obtained from the manufacturer.

The device has been thoroughly tested by the manufacturer and, in fact, is an improvement of an older one manufactured by the same company.

Manufactured by American Battery Co., 1132-1134 Fulton St., Chicago, Ill. Price, for alternating current circuits of from 50 to 125 volts pressure, $24; ammeter, extra, $8. Shipping weight, 45 pounds.

Schrader Universal Quick Acting Dust Cap. The firm of A. Schrader's Son, Inc., is bringing out a new patented quick acting dust cap which, besides being easy and rapid in attachment and detachment, possesses the additional quality of being highly ornamental. The new dust cap is made of brass drawn into a shell and has two lateral teeth or prongs made of tempered steel which fasten into the thread of the valve stem.

There is no screwing or turning of the cap to engage the thread of the valve stem. One simply slips the cap over the valve stem as he would slip a thimble over



Schrader Universal Quick Acting Dust Cap No. 3199, Patented Nov. 23, 1915, April 29, 1919.

his thumb. The entire operation of putting on or taking off the new dust cap occupies less than two seconds.

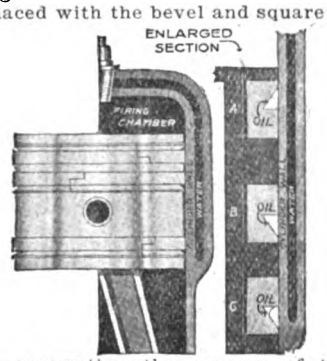
Because of its clean lines and high nickel finish it will make a special appeal to motorists who are fastidious as to the appearance of their cars.

Manufactured by A. Schrader's Son, Inc., 800 Atlantic Avenue, Brooklyn, N. Y. Retail price, 50 cents; $2.50 for a set of five.

The No-Leak-O-Oil Sealing Piston Ring is a patented piston ring that is guaranteed by the manufacturer to prevent the passage of oil from the base of the engine into the combustion chamber and also prevent the passage of kerosene, or coal oil as it is sometimes called, from passing from the combustion chamber, where it is present in the fuel gas, to the base of the engine and mixing with the oil of the reservoir.

The rings are similar in construction and form to the regular cast rings, differing from them by having a groove cut at right angles to their face, and passing completely around the ring. One edge of the groove has a square edge, while the other is beveled at a 45-degree angle.

In placing a set on the piston the upper ring is placed with the bevel at the top and the square edge down, to prevent the passage of the kerosene. The other rings are placed with the bevel and square edges



down, preventing the passage of the oil from the base. In operation oil from the base works up on the cylinder walls, fills the two bottom grooves, acting as a cushion or packing between the piston and the cylinder wall, while the upper grove, filled with oil and kerosene, acts in the same capacity. By this method, it is claimed, carbon in the combustion chamber is reduced to a minimum, and the wastage of oil from the base is prevented. If a cylinder is scored or badly scored, it is further claimed that no direct benefit will be obtained.

The accompanying cut well illustrates the placing of the rings on the piston.

Manufactured by No-Leak-O Piston Ring Co., 824 W. North Avenue, Baltimore, Md. Prices and literature on application.

Ford Car Enamel is an enamel paint that the manufacturer claims can be applied to the car one day and will dry so that the car may be used next day. The paint and varnish are combined so that only one coat is necessary, requiring but very little time and effort to apply.

The ingredients used in its manufacture have been proven by the manufacturer to be highly satisfactory for applying to

metal surfaces, for withstanding the expansion and contraction of the metal, and insures a beautiful lustrous and lasting finish.

Other articles manufactured by the company include Waterproof Mohair Top Dressing, Leather R-Nu, Nu-Auto Finish, Diamond Carbon Remover, Engine Enamel, Lining Dye, Aluminum Paint, Body-Nu, Brass-Nu, Rubber-Nu, Nu-Back Shellac and Lamp and Fender Enamel.

Manufactured by the Nu-Back Manufacturing Co., St. Louis, Mo. Prices, Ford car enamel, quart, $1.50; pint, 90c.

Columbia, S. C.; Bagnal Rankin Motor Co.; $5000; M. R. Bagnal, C. B. Bagnal.

Jonesboro, Tenn.; Hanks-Morris Co.; $20,000; E. B. Hanks, R. J. Morris, T. H. Morris, J. R. Hagan, Flora E. Hanks.

Memphis, Tenn.; Mississippi Valley Motor Car Corporation; $50,000; R M Darnell, O. W. McClure, A. R. Orgill, Solon Hamer, S. T. Brown, F. M. Gilliland.

Dallas, Tex.; Gould Battery and Service Co.; $6000; William Tobain, H. Lange, W. B. Clayton.

Dallas, Tex.; Harvey Motors Co.; $20,000; H. A. Harvey, Howard Harvey, L. E. Harvey.

Dallas, Tex.; McMillan Motor Sales Co.; $20,000; J. E. McMillan, D. L. Harris, A. M. Bradley.

El Paso, Tex.; Motor Car Sales Co.; $25,000; John Fleming, B. F. Scholer, Avis Fleming.

Houston, Tex.; McDill-Elmer-Ransom Co.; $15,000; R. H. McDill, C. D. Elmer, R. J. Ransom.

Houston, Tex.; E. B. Smith Motor Co.; $16,000; Earl B. Smith, Ben Taub, A. Sander.

Marshall, Tex.; Triangle Motor Co.; $8000; George T. Bishop, M. R. Newnham, J. B. Bishop.

San Antonio, Tex.; Wallace Motor Co.; $15,000; W. H. Wallace, R. B. Westbrook, J. C. Wallace.

Waco, Tex.; Herring-Wright Co.; $16,000; auto transfer business; J. F. Wright, W. C. Herring, C. F. Dumas.

Dundas, Va.; The Star Motor Co.; $10,000; W. A. Daniel, A. W. Reames.

Milwaukee, Wis.; Auto Mutual Service Co.; $50,000; L. S. Dilweg, Louis R. Zarse, Maurice Geisenfeld.

GMC EARNINGS.

A reflection of the activity which prevailed in the automobile industry during the first six months of this year is found in the half yearly report of the General Motors Corporation. The net profits amounted to $48,900,800, or nearly double the amount reported for the corresponding period of last year.

After provision for Federal taxes there was a surplus available for dividends of $30,591,598 and a surplus available for common stock of $29,125,940, or the equivalent of $19.70 a share on the $147,647,700 common stock capitalization. In the six months ended June 30, 1918, there was a balance of $12,587,259 available for dividends, and that proportion applicable to the common was $11,717,480 on the 1,051,417 common shares then outstanding.

The balance sheet shows that the company on June 30 had cash on hand to the amount of $74,799,444 as compared with $31,186,737 on June 30, 1918. The company's holdings of Liberty bonds also show a big gain, the amount recorded this year being $21,709,030, or about $12,600,000 more than on June 30, 1918.

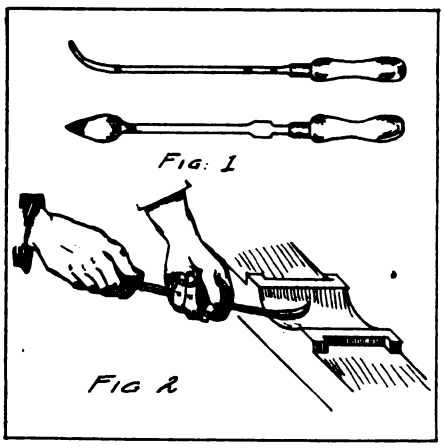
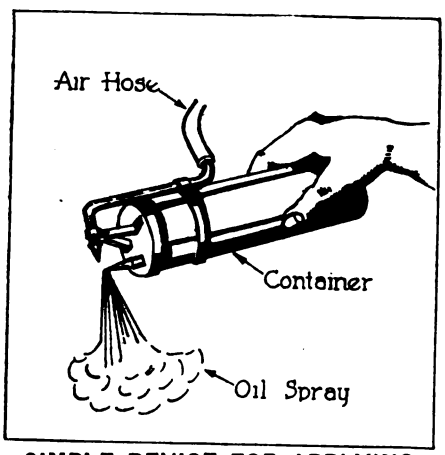
Mechanical Suggestions for Garage Men



HOME MADE BEARING SCRAPERS.

In fitting connecting rod or main bearings the repairer often finds it necessary to scrape the bearings to obtain a perfect fit. Scrapers may be purchased from supply houses, but a set may be made in a home garage that will be as serviceable as those purchased. Two 14-inch files are required. Heat the files in a forge and draw them down to about half their width. Heat the point of a file to a cherry red and while cooling hammer it to the shape shown in Fig. 1, drawing the edge to a cutting edge and slightly spoon shaped. Fig. 2 shows the scraper in use. It is found very handy in fitting engine bearings after they have been tested with Prussian blue and the high spots are shown. The scraper is used for removing the high spots.



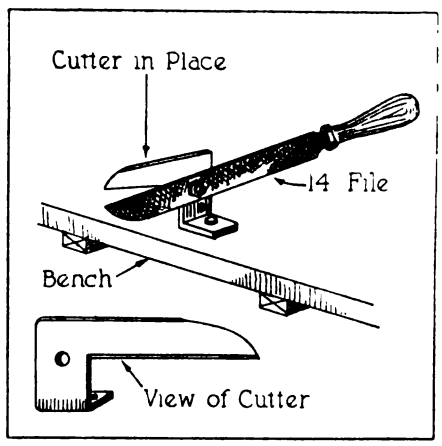
SIMPLE DEVICE FOR APPLYING POLISH.

A simple device for applying polish or paint to a car is made as follows: Obtain a long, round can and solder a short, tapered tube at one side of the cover as shown in the cut. A length of hose connected to the air system of a garage supplies the necessary air pressure through a small nozzle held in position by a brace soldered to the cover, the nozzle pointing at a right angle to the tube.

To make this device more substantial the container may be made of a section of 2½-inch pipe, having a cap screwed on at the bottom and a cap at the top with the brace and tube fastened to it. The tube is best fastened by drilling and tapping a hole and threading the tube into it. It is claimed that this device will effect quite a saving in the use of polish or paint against applying it with a cloth or brush.

HOME MADE METAL CUTTING SHEARS.

Bench shears for cutting sheet metal can be constructed by a machine, the stationary jaw that is fastened to the bench bearing formed from a section of wagon spring. Heat the section in the forge and bend to the shape shown in the cut. Drill a hole near the end to fasten the section to the bench and a second hole for attaching the cutting bar. Grind the cutting edge on a sharp bevel



so that it will retain its edge. The lever is made from a 14-inch file, the teeth of which are ground off on an emery wheel, and the cutting edge beveled. Clamp the two sections together with a bolt.

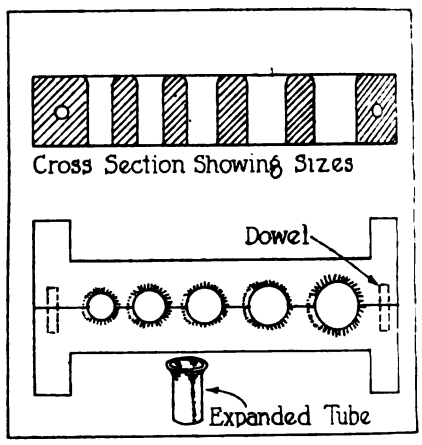
ANNEALING STEEL.

According to a recent patent granted to F. Bagliard of Milan, Italy, high-speed steel is annealed by heating it to 1000 degrees Fahrenheit, withdrawing it from the fire, allowing it to cool for a few seconds beneath cinders and then immediately quenching it in water or grease, or preferably in a mixture of 200 parts animal grease not containing stearin, 700 parts tallow and 100 parts of charcoal.

DRILLING SPRING STEEL.

When drilling holes in spring steel, or tapping threads in iron where the tap is a trifle small for the hole, by applying a small quantity of wood alcohol to the drill or tap the drill can be started and the work can be easily done. Without the alcohol the drill could not be started. The same result can be obtained when using the tap in iron.

Be extra careful about closing the clamps at the ends of the chains. If they come loose an expensive chain will be lost. It simply drops off unknown to the driver.



OIL PIPE FLANGING DEVICE.

Quite often in overhaul work the repairer finds it necessary to flange small copper oil or gasoline feed pipes. These will vary in size in different engines. To simplify the work and do a good job a flanging device will prove handy.

The device shown is in two sections, U shape, with set screws for clamping each to a vise jaw. The two sections are doweled together. In using the device the tubes are gripped in it and the ends flared as indicated.

GLASS TUBING CUTTER.

A simple, efficient device for cutting glass tubing, such as used for oil gauges, sight feed glasses, etc., may be made from a three-cornered file, a piece of board for the base, a wood vise block, a staple and a simple length gauge made of a piece of one-quarter inch rod, flattened at one end and bent to serve as a stop. The gauge is inserted in a hole bored in the base and adjusted by sliding in or out and secured by a wood screw. To use the device the V block is placed on the board and the glass tube is laid in the block. The stop is adjusted to the length of tube desired. The tip of the three-cornered file is inserted under the staple. Press down lightly on the file and roll the tubing, scoring it with the file. Remove the tube, light a match and heat the glass at the score, and plunge the glass tube in water. The tube will break perfecty square.

Lawrence Process of Repairing Scored Cylinders

Large Business Has Been Developed and Much of the Work Is Done for Automobile Concerns Throughout the Country --- Successful Suits Against Infringers

IT IS well known that a great many cylinders of internal combustion engines are damaged by wear and very often they are scored by foreign matter getting into the cylinder or by parts of the apparatus becoming disarranged and scratching or gouging the interior of the cylinder so that there is no tight fit between the piston and the cylinder, and thus causes poor compression and the engine soon becomes useless. The scoring is very often caused by reason of a wrist pin coming loose and being carried along by the piston and scraping the interior wall of the cylinder so that it becomes channeled or scored.

It has heretofore been the practise to repair scored cylinders by grinding or reboring them. This is a very slow method and is expensive because of the time required for the purpose, and such manner of repairing necessitates the use of a new size piston and ring. Also each time a cylinder is reground it is weakened and the wall of the bore is made thinner.

Another method has been to weld the scored parts to the cylinder, but in subjecting the cylinder to a welding heat the same becomes warped, and, therefore, in the majority of instances, requires grinding or reboring, and again disturbing the contour of the inside of the cylinder wall.

L. Lawrence & Co., owner of the patents covering the process of repairing scored cylinders, with main offices in the Woolworth building, New York City, began business at Newark, N. J., in 1862, making copper work for manufacturers.

Pittsburgh Plant of L. Lawrence & Co., Owner of the Lawrence Patented Process for Repairing of Scored Cylinders. Main Offices of the Company Are Located in the Woolworth Building, New York City. In Addition to 12 Branch Plants, the Company Has Representatives in 76 Cities. Special Prices Are Made to Automotive Dealers. The Company Plans to Build Up a National Organization for the Sale of Automotive Accessories.

This company also is the owner of patents covering the repair of sand holes and blow holes in rough castings, and is doing a large volume of this work for well known automobile concerns and foundries throughout the states.

History of the Company.

The head of the firm invented the Lawrence patented process for repairing scored cylinders in 1915 and the business grew so fast that it was necessary to open a branch plant at Detroit, Mich., in May, 1916. Right after the Lawrence company exhibited in the 1916 automobile show at the Coliseum, Chicago, a branch was established in that city.

A branch plant was opened at Cleveland in 1917. On the Pacific coast the demand for the Lawrence service has required the concern to establish plants at both San Francisco and Los Angeles.

The Chicago plant has been getting so much work from the Wisconsin, Minnesota and Northern Michigan territory that plants have recently been opened at Milwaukee and Minneapolis. This was done to avoid the shipping delays getting cylinders in and out of Chicago. Every winter the Chicago plant has repaired a great many cracked water jackets and scored cylinders for dealers in Wisconsin, Minnesota and Northern Michigan, and the Milwaukee and Minneapolis plants will shorten the time required for repairing.

Suits brought by the company against infringers of its patents have been won in several states. The firm makes special prices to automotive dealers who send scored cylinders in to be repaired and this policy has been largely responsible for the rapid growth of the business.

The greatest care is taken to finish all work so carefully that there are no "come backs" on the firm's policy of guaranteeing all work for the life of the motor. New mechanics who are learning the process are never permitted to finish a job alone until they have had sufficient experience and practise. The Lawrence officials realize that money spent in thoroughly training the mechanics saves both trouble and time later on.

The Lawrence company, outside of its 12 branch plants, is represented by responsible persons in 76 cities throughout the states, and before this year is over, with the aggressive campaign which is now in progress, will be represented in every city and town of any size throughout the country. At least this is the aim of the organization.

The Lawrence organization plans to build up a national organization for the sale of automotive accessories, and, with its branches and representatives throughout the country is in an excellent position to carry on this business in conjunction with their other work.

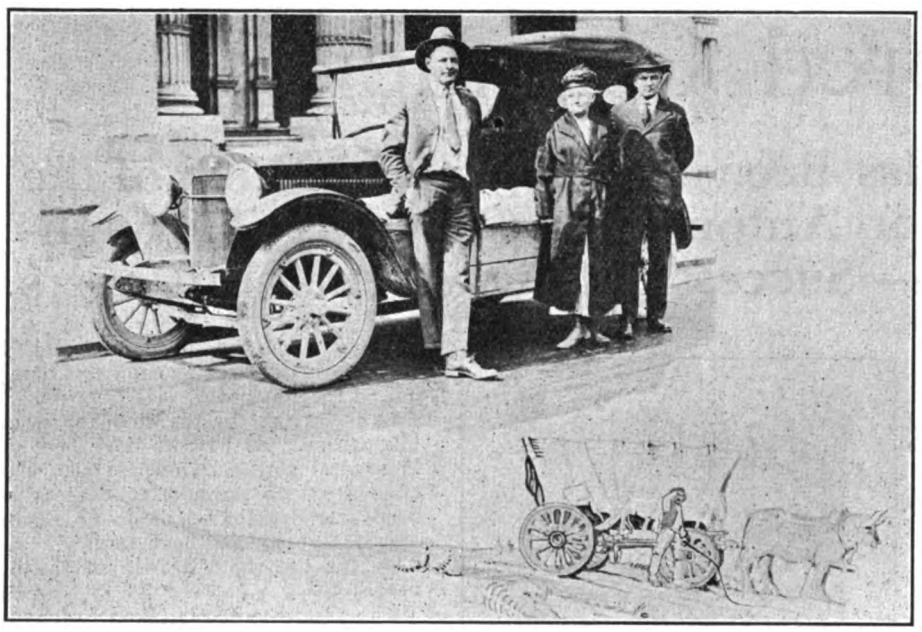
THIS TIME PIONERS CROSS CONTINENT IN AUTOMOBILE



Years Ago They Made the Trip in an Ox Team, but Their Recent Tour Was a Luxurious One in a Liberty Six.

AN AMBITION of a life time, conceived as they wended their way over the prairies in 1864, was fulfilled recently when E. J. Dunham and wife of New Hartford, Ia., arrived at Berkeley, Cal. Over the same 5000-mile trail the aged couple came, but this time, instead of consuming months of time and having to prod along a slow moving ox team, they drove luxuriously in a Liberty Six.

It was on May 22, 1864, that arrangements were first completed for the trip to what was then the "promised land." Several neighbors joined in the party, among whom were Charles E. Needham and family. At Carson City, Nev., a halt was called in order to allow the stork to transfer a new passenger. The arrival proved later to be Congressman J. C. Needham, who was born in the early morning as the pioneers were preparing breakfast.

The old prairie schooner was discarded after the trip ended, but pictures of it, made in the East, are still among the most prized possessions of the Dunham family. Later in years the party broke up and Dunham returned to the scene of his first endeavors. He accumulated wealth and today is reputed to be one of the leading men of the community.

Ambition Realized.

"I hope to live and see the day when I can go back over this trip in real style and enjoy the sights," Dunham had told his neighbors as they bumped along over the roadless prairies and mountains, avoiding the hostile redskins and sustaining themselves by the game that fell before their crude old muzzle loaders. And he did it.

"3 IN ONE SENSE" ISSUES SPLENDID SOUVENIR NUMBER.

The September issue of "3 in One Sense," the house organ of the 3 in One Oil Co., was made a special number in honor of the 25th anniversary of the company. The pages were amplified, and dressed up in birthday clothes. A copy, under full letter postage, was sent to nearly 80,000 retail dealers and jobbers all over the United States as a souvenir. For many years this pubication has been the only point of contact between the company and the 250,000 dealers who handle its product, distribution being entirely through jobbers. Much of the good will enjoyed by the company at the hands of retail dealers may be laid to the splendid work accomplished by this little house organ. In the anniversary number it told the story of the company's remarkable progress, in an easy, readable manner, and there have been included unusual features in picturing the growth of other industries, including the automotive industry, with which 3 in One Oil has grown up and which have broadened the field of this wonderful product.

LINES SALES MANAGER.

M. S. Lines, who for the last two years has been special sales representative in the eastern states for the Gordon Tire & Rubber Co., Canton, O., has become sales manager for the company, succeeding A. W. Senz, who resigned to go with the L. & M. Rubber Co. Mr. Lines was for seven years with the Michelin Tire Co. in the sales department.

TUCKER WITH LAFAYETTE.

Edward Tucker, Jr., formerly associated with Joseph A. Schulte in the Detroit retail branch of the Cadillac Motor Car Co., has accepted a position with E. C. Howard of the Lafayette Motors Co., Indianapolis.

PACKARD ELECTRIC EXHIBIT.

The Packard Electric Co., Warren, O., will display samples of its lighting, starting and ignition products at the Automotive Equipment Association show in Chicago. At the back of the booth will be three large display boards showing samples of cables, also samples of cable assemblies which the company makes for motor car manufacturers.

"While we do not sell assemblies to the jobber," the company states, "we still feel that the jobber is interested in seeing how these jobs are made up for original factory equipment on various cars, and for this reason we will display the cable assemblies as well as bulk cable."

The exhibit will also include the company's standard sample board, which is furnished to distributors, also the cable racks which are used for storing and displaying distributor stock of cable. Probably the most striking part of the exhibit will consist of a reproduction of the ignition system on an automobile.

There will be an Atwater Kent distributor driven by a small electric motor, and this exhibit will be connected up with six spark plugs by high-tension cables of the company's manufacture. Between the distributor head and the spark plugs these cables will run through an oil bath, the cables to be left in the oil bath continually throughout the show. This test will show that the cables will continue to function even under the most adverse conditions.

MOSSBERG EXHIBIT.

The Frank Mossberg Co., Attleboro, will display socket wrench sets, double end wrench sets, Ford necessities and its new line of all-steel indestructible socket wrenches in the speed brace offset and "T" handle types at the Chicago show of the Automotive Equipment Association. The company will feature display boards six feet in height, covering the new all-steel indestructible socket wrenches.

ALBERTSON ISSUES FORD BOOK.

Albertson & Co., Sioux City, Ia., has issued a new book, "The A-B-C of Ford Motor Repairing." The book instructs Ford owners in proper methods of grinding, refacing and reseating valves and valve seats. Instructions are given in a simple, non-technical manner. The outfit described for the work is designed for a Ford car or truck, and its retail price is $7.75. The tools are exact duplicates of the larger "Sioux" tools for all makes of cars, trucks and tractors.

MAIBOHM CAPITAL INCREASE.

More than $500.000 worth of treasury stock has been sold by the Maibohm Motors Co., Sandusky, O., increasing its working capital to more than $1.000.000. The 1920 production schedule calls for 7500 cars. Prior to this year the company had not entered the eastern market

The Fisk Nine prove that good athletes make good workmen

FISK TIRES

The Fisk line is an unusual selling proposition—a *complete* line, no gaps, no fill-ins.

The Fisk Non-Skid, the Fisk Red-Top, the Fisk Cord. All good looking, all oversize, each to fill a particular place in the dealer's line.

Stand any one of these up alongside other tires of the same class and size and note the size, the care in every detail, the good looks of the Fisk Tires.

The ideal of the Fisk Rubber Company is to be the best concern in the world to work for and the squarest concern in existence to do business with.

Sold *direct* to dealers and manufacturers

There is a Fisk Branch within 24 hours of you

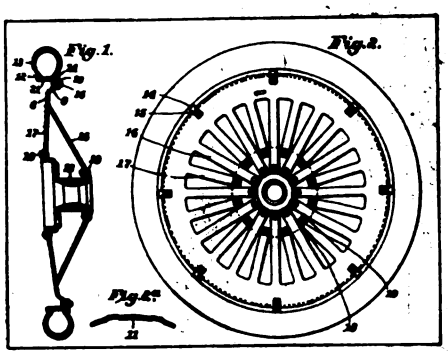
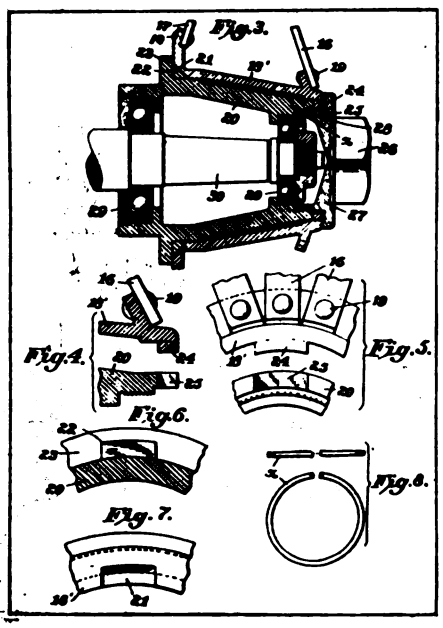
PRESSED STEEL WHEEL DESIGNED TO BE USED ON THE AUTOMOBILE

Exclusive of the Hub, It Is Made from a Single Disc of Metal —Said to Be Light in Weight and Resilient





The Foregoing Illustrations Show in Detail the Various Features of a Pressed Steel Automobile Wheel Designed by L. M. Ricketts. The Numerical References Are Explained in the Accompanying Text. Mr. Ricketts States That Definite Plans for Manufacturing Have Not Been Formulated, but Are Now Under Consideration.

L. M. RICKETTS, 3624 Roland avenue, Baltimore, Md., has invented a pressed steel automobile wheel, which, exclusive of the hub, is pressed from a single disc of metal. Mr. Ricketts states that it is strongly constructed, light in weight and resilient, and that, by means of projecting bosses on the outside of the rim, absolute concentricity is obtained. He says:

"The complete wheel can be changed or only the demountable rim and tire. This is both a demountable wheel and demountable rim. The cost of this wheel compares favorably with the wood wheel, and much cheaper than the wire wheel. The increasing shortage of suitable timber for manufacturing wood wheels puts the situation squarely up to the manufacturers of steel wheels. It is not the popularity of the wire wheel that is causing the increasing use thereof, but absolute necessity."

In the accompanying illustrations figure 1 is a section view of the wheel, figure 2 a side elevation of a portion of the wheel, figure 2A a detail, figure 3 a section view of the hub with a portion of the wheel in place thereon, figure 4 a portion of the wheel and a portion of the hub which interlocks therewith, figure 5 a face view looking at the parts of figure 4 from the right hand side thereof, figure 6 a detail view of a portion of the hub and figure 7 a detail view of a portion of the shell of the wheel. Figure 8 shows in two views a split locking washer.

In figure 1, 8 indicates the body of the wheel, which is formed of sheet metal, this body portion consisting of an annular portion arranged in a plane substantially at right angles to the axis of the wheel and a portion, 9, continuous with the portion 8, but extending at an angle laterally from the plane of the portion 8, this annular portion being curved at 10 and merging into an overhanging pin portion, 11, which is arranged substantially central over the annular body part, 8, and is provided with a flange, 12, at its terminal edge.

The edge of the rim, 11, opposite to the edge at which the flange is located is devoid of a flange and this enables a demountable rim and tire, 13, to be slipped in place and held by clips, 14, which are retained by bolts, 15, passing through the angular extension of the annular body. The body portion 8 is formed continuous with spokes 16 and 17. These spokes are cut from the body of the metal and one series, 16, extends to the right in figure 1 and the other series extends to the left. These spokes alternate with each other and their lower ends are connected with the right hand and left hand ends of the hub or shell, 18, by any suitable means such as by the rivets, 19.

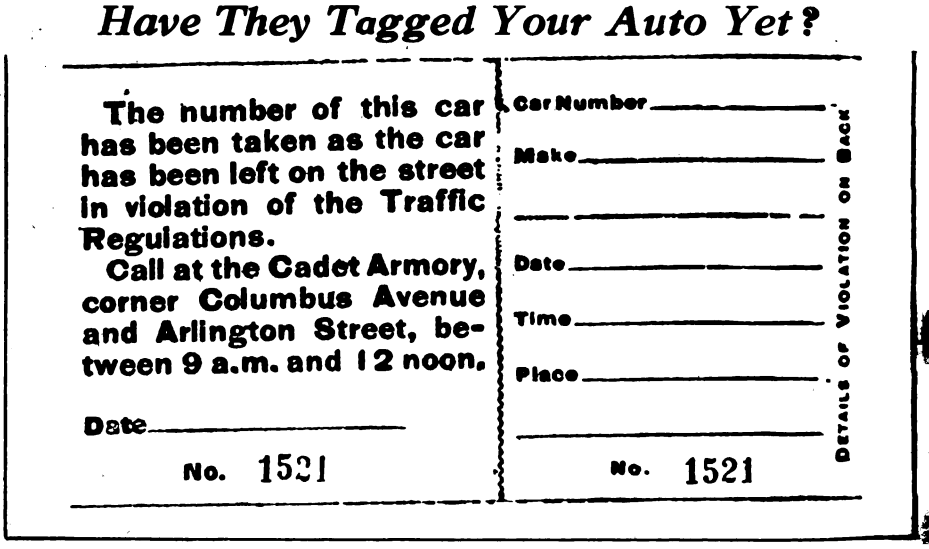
The arrangement is such that the rim of the wheel is substantially over the larger inner end of the hub. In figure 1 the spokes 17 are in plane substantially at right angles to the axis of the wheel, though these spokes may be inclined to a sharper degree than illustrated in figure 1.

In figure 3 is shown the wheel shell or center, 18, mounted on the hub, 20, so as to turn with said hub as one body therewith. For this purpose the shell is provided with a notch or cut out portion, 21, which fits over a fillet, 22, on the hub, adjacent the flange, 23. The outer end of the shell is provided with an inwardly extending projection, 24, which fits into a notch, 25, in the hub and thus the shell is held against circumferential movement in relation to the hub. The shell is held against axial displacement in relation to the hub by a nut, 26, which has a base or flange portion, 27, lying over the end of the shell and restraining it against axial displacement. The nut is screw threaded at 28 into the end of the hub. Roller bearings are provided at 29 between the hub and the axle.

In figure 3 is shown the wheel shell or center mounted on the hub so as to turn with the hub as one body therewith. For this purpose the shell is provided with a notch or cut out portion, 21, which fits over the fillet on the hub, adjacent the flange, 25.

The outer end of the shell is provided with an inwardly extending projection, 24, which fits into a notch in the hub and thus the shell is held against circumferential movement in relation to the hub. The shell is held against aerial displacement in relation to the hub by a nut, 26, which has a base or flange portion, 27, lying over the end of the shell and restraining it against aerial displacement. The nut is screw threaded at 28 into the end of the hub.

Have They Tagged Your Auto Yet?



When the Police in Many Cities Find an Automobile Left Standing in Violation of the Traffic Ordinances, They No Longer Wait for the Owner or Driver to Put in Appearance. They Simply Put a Tag Summons on the Car. Above Is a Likeness of the Tag Used by the Military Police in Boston.

A Double Service for Motorists and Garagemen at these Branches

Every Branch and Authorized Distributor of United Motor Service Inc. performs a double function—the distribution of genuine service parts and the making of necessary repairs and adjustments.

The complete stocks of parts carried in every Branch, and by our Authorized Distributors have been passed by the manufacturers of Delco, Klaxon and Remy electrical equipments. They are *genuine* in every sense of the word.

The service rendered in the form of repairs and adjustments is given by men trained in the factories of the Dayton Engineering Laboratories Co., the Remy Electric Company, and the Klaxon Company.

And you are accorded a prompt, courteous and highly efficient service.

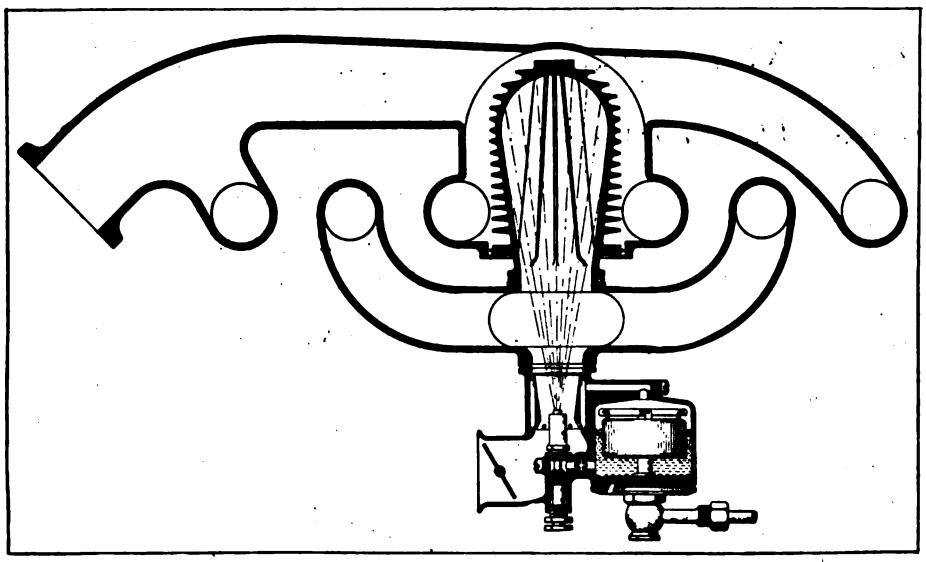
STEWART HEAVY OIL SYSTEM FOR TRACTOR ENGINES.

What is known as the Stewart Heavy Fuel System is about to be produced commercially by the carburetor division of the Stewart-Warner Speedometer Corporation, Chicago, and this is claimed to be a method of carbureting heavy oils that has been found to be extremely satisfactory.



Drawing Showing the Stewart Heavy Fuel System, Designed to Preheat and Vaporize Gasoline, Kerosene or Distillate.

The system is in effect the use of a heating chamber in combination with the fuel intake of an engine, and this combination is maintained to be adaptable to practically all engines. This chamber is combined with the exhaust manifold and it is directly above the spray jet of the carburetor, so that the fuel as carbureted is projected above the intake manifold into it. Claim is made that the fuel is accurately metered by the air flowing to the engine and is projected out of the air stream and into the vaporizing chamber, where it is completely vaporized. The vapor condenses upon coming into contact with the air in the manifold, forming a fog mixture at the lowest possible temperature consistent with a perfectly constituted fuel mixture.

Statement is made that exceptionally fine division by direct spraying at the carburetor nozzle is an expedient for securing uniform distribution of the fuel over the vaporized surface, to the end that its capacity may be high and its size as small as possible. Only the fuel enters the vaporizer. The vapor formed in the heated chamber flows out over the incoming fuel spray and gives up a portion of its heat directly to the liquid globules.

Economy of Operation.

In the fitting of the Stewart Heavy Fuel System, made to secure maximum economy of operation, the charge temperature has a constant value (within plus or minus three to four degrees Fahrenheit) under all conditions of operation, from idling to full load at highest speed. The only change in conditions that can alter the mixture temperature is modification of the ratio of fuel to air in the mixture. An enrichment causes a rise in charge temperature, since more heat is then given up to the air by the fuel vapor. The converse is equally true. This affords an inherent control, and as a consequence no regulation of the exhaust gas sweeping the vaporizing chamber is necessary.

The system is primarily intended for use with trucks and tractors and with kerosene, distillate and gasoline may be burned.

GUARANTY Motor Repair Arm

(Patent No. 1,289,100, Dec. 31, 1918)
Note the date

The GUARANTY REPAIR ARM is scientifically made in rights and lefts. It fits the Ford pleasure car, truck or unit without alteration. Extended prongs provide greatest possible bearing surface and reinforcement.

It is the most efficient, durable Arm produced by a house of integrity. It saves time and expense. Just a wrench and a few minutes anywhere—on the road, street or in the garage, make a permanent repair. Merely loosen 6 bolts. Tighten nuts. Don't disturb motor.

Price $1.50

GUARANTY MOTORS COMPANY

436-38 MASSACHUSETTS AVE., CAMBRIDGE, MASS.

Manufacturers of the Well-Known GUARANTY LINE

GUARANTY Internal Drive Units for converting pleasure cars into trucks, GUARANTY Power Hoists, Pliable-Drive and Extended Frames for Ford Worm-Drive Trucks, Repair Arms, etc.

Dealers: *Exclusive Territory now being assigned. Write or wire for liberal discounts on our entire line. Learn of our unfailing co-operation and publicity for your profit.*

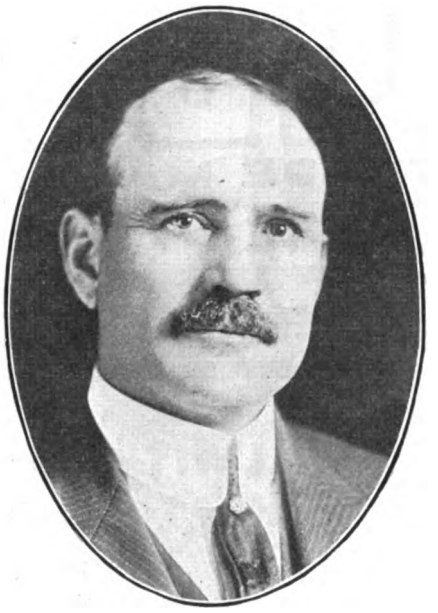
Lafayette Ready for Production

E. C. Howard.



Charles W. Nash.

D. McCall White.

THE Lafayette Motors Co., Indianapolis, recently incorporated for $6,000,000, expects to have a Lafayette car ready for the national shows in January. Officials of the company hope to be able to produce cars in quantity early next summer. The car was designed by D. McCall White. A plant in Indianapolis has been purchased.

Charles W. Nash, president of the Nash Motors Co., Kenosha, Wis., is president. Mr. White and E. C. Howard are vice presidents, in active charge. James J. Starrow of Boston will act as chairman of the board of directors.

Mr. Howard was formerly general sales manager of the Cadillac Motor Car Co. in Detroit. Mr. White is perhaps best known for his successes as designer of the English Daimler and Napier engines, and the Cadillac eight in this country. Until recently he was vice president of the Cadillac company.

Both Mr. White and Mr. Nash were prominent in the creation of the Liberty Motor, Mr. White as supervising designer and Mr. Nash as production manager. Mr. Nash will, of course, continue as active president of the Nash Motors Co. and it is understood that his association with the Lafayette company will be largely in an advisory capacity. Capable department heads have been engaged.

RAYFIELD THERMOSTAT MEANS PROFIT FOR DEALERS.

Every automobile dealer undoubtedly has noticed that with the approach of cold weather the troubles and annoyance of engine starting have caused a great deal of dissatisfaction among his customers, and consequently he has been forced to give a good deal of service in which there is no profit.

These dealers will be glad to know that there is now on the market a device which will enable them to turn these unprofitable calls into a source of good business. This device is the Rayfield thermostat, made by the Beneke & Kropf Manufacturing Co, manufacturer of Rayfield carburetors The latest model has several improvements which make this device simple in construction and automatic in operation. It is easily installed on any automobile, truck or tractor on the top water connection where there is no possibility of clogging. It ensures easy starting and does away with many of the troubles of a cold motor.

It enables the motor to warm up quickly by controlling the circulation of water through the radiator and motor block. Because the motor does warm up quickly, a minimum of unburned fuel escapes into the engine to dilute the oil in the crankcase and to form carbon in the cylinders and spark plugs. With this device on a car the spark plugs seldom, if ever, need cleaning.

Dealers everywhere have found that the Rayfield thermostat sells easily, for it has a universal appeal to all users of gas engines. In fact, many dealers make many of their sales over the telephone when the motorist calls up to get some one to start his car. The increased production made possible by the growing demand enables the company to put this thermostat on the market at a price within reach of every motorist, and at the same time allows the dealer a substantial margin of profit.

HERSCHELL-SPELLMAN EXPANDS.

The Herschell-Spellman Motor Co. plans to issue $75,000 additional preferred stock and a like amount of common stock, in order to increase capacity by plant extension, so that there will be a production of 100 four-cylinder and 100 six-cylinder motors daily.

DETROIT OFFICE FOR LANCASTER.

Frank N. Adgate, western sales manager of the Lancaster Steel Products Co., Lancaster, Pa., has appointed W. J. Lucas manager of the new Detroit sales office of the company.

BODY BUILDERS AND REPAIRERS STRIKE IN EW YORK.

Nearly all of the body builders and repairers in New York City are on strike. They are chiefly affiliated with the Air Craft and Body Builders' Union, 953 Third avenue. The union has about 1200 members, but its charter was revoked a year ago by the American Federation of Labor, and it has not been recognized as a union in dealing with employers. A 44-hour week with a 15 per cent. increase in wages for workers receiving $35 or less a week and 10 per cent. for those receiving more than $35 is asked. The strike affects nearly 100 automobile body builders, repairers, upholsterers and painters in Manhattan and Queens. The body workers in Brooklyn have not yet gone out. Charles E. Hawkes, secretary of the Auto Body Manufacturers and Applied Trades of New York City, says that the organization of employers will not treat with the union, but that members are willing to deal individually with their workers.

A device for the boring and grinding of engine cylinders at one operation, the invention of M. L. Williams and George W. Cole, is shortly to be put on the market by the Standard Tool and Engineering Co., South Bend, Ind.

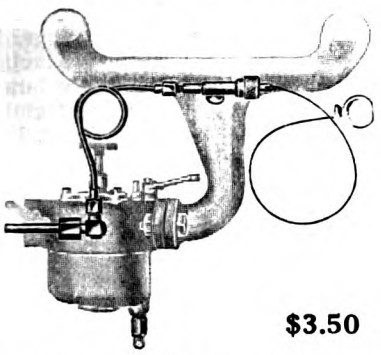
J&B MANUFACTURING COMPANY
J&B PRODUCTS
PITTSFIELD, MASS. U.S.A.

FORD CAR OWNERS BUY

J & B specialized trade marked products because they are guaranteed quality, known utility and long service life. They are designed to give the best possible service results. They are contructed of highest grade materials.

Exceptional facilities insure great production. Deliveries are made to schedule. J & B factory service is equal to the quality of the products.



$3.50

J & B Gasoline Injector

's a wonderfully efficient priming device that insures engine starting at any temperature. A rich mixture of gasoline, taken from the fuel supply pipe, is injected directly into the intake ports. Firing must be positive.

The carburetor is not drawn upon until the engine starts and cannot be flooded, nor can the cylinders be choked with too rich gas.

A positive operating device that any owner can install without special tools.

J & B Original Timer, Model T-1

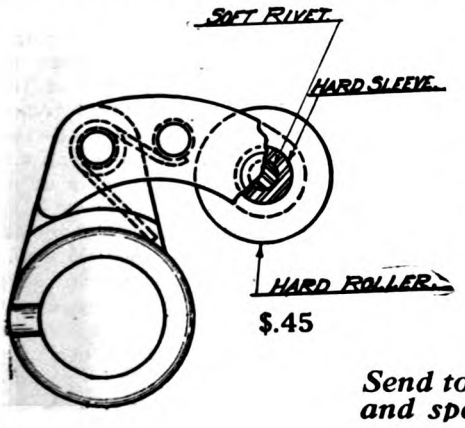
Will improve engine operation immeasurably. The design of the rotor is such that contact is positive and wear is negligible. The contacts are wiped clean with every revolution.

The oiler is large enough to take the spout of an oil can and is fitted with a spring cover, insuring against the timer becoming defective from dirt. It is the only thoroughly protected timer made.

$1.45

J & B Timer Rotor

Is to replace the brush of Ford timers. It is a hub with a flexible arm carrying a hardened roller that revolves on a hardened sleeve, retained by a soft rivet. The wear is on the pack hardened sleeve and roller. A torsion spring maintains a constant pressure of the roller against the fibre ring, insuring positive contact and firing.



$.45

J & B products are standards. The recognition of their quality is solely from merit. They are the best sellers of their kinds. JOBBERS and DEALERS: We offer specialized trade market products produced in great volume, promoted by an aggressive sales policy and generous advertising.

J & B products are priced right and the jobbers' and dealers' discounts are liberal.

Let us advise if you do not now sell them. It is a proposition that means worth while profits.

Send today for latest list prices and special trade information.

TIRE INDUSTRY AND TRADE

The A. J. Stephens Rubber Co., Kansas City, has increased its capitalization to $1,500,000 for the purpose of engaging in the manufacture of tires and tubes. The company has had rapid growth in the manufacture of tire accessories and fabric products. A. J. Stephens, founder of the business, becomes president and general manager of the corporation. He says that approximately six months will be required for the complete installation of tire making equipment, as equipment adapted for tire making already in the plant cannot be diverted from its present use. "We expect to produce a cord tire that will be as good as a good tire can be made," says Mr. Stephens. "We figure it is the only way we have a chance to compete with the larger companies. We will also manufacture a fabric tire and we are going to get away from the mileage guarantee just so far as possible. There is no question but what all of the better known tire factories will be selling their tires on a basis of no mileage guarantee with the provision that any defects in material or workmanship will be made good."

The Portage Rubber Co., Barberton, O., announces that at a recent directors' meeting it was ordered that the regular quarterly dividend of three per cent. on the common stock be paid Nov. 15 on all stock of record Nov. 5. The directors also ordered the immediate preparation of plans and specifications for a three-story addition to the factory, 80 by 200 feet, to be of reinforced concrete construction at an estimated cost of approximately $200,000 to provide greatly needed additional factory space.

The Stanwood Rubber Co. announces the appointment of J. J. Moriarty as general superintendent of its Newark-Elizabeth Hardman plants. For several years he has been efficiency expert and head of the compounding department of the Firestone Tire and Rubber Co.

The Pennsylvania Rubber Co. has arranged for a display and sales room on the Garden Pier, Atlantic City. Five rooms have been leased on the northeastern end of the pier. There will be writing and rest rooms. C. B. Williamson will be in charge. The opening will take place about Jan. 1.

The Pennsylvania Rubber Co. has opened branch offices in Cincinnati, O.; Charlotte, N. C., and Los Angeles. J. G. Smith, who recently returned from service overseas, will have charge of the Cincinnati branch. John D. Williamson, formerly North Carolina representative, will be in charge at Charlotte, while the Los Angeles branch will be in charge of Mr. Edelman, formerly connected with the Omaha branch.

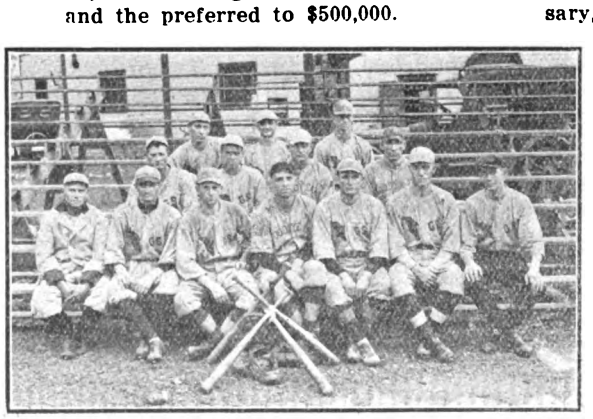
The J. & D. Tire Co., Charlotte, N. C., has changed its name to the McClaren Rubber Co., manufacturer of McClaren tires, with H. L. McClaren, former president and general manager of the Racine & Ajax Rubber companies, as president and treasurer. Manufacturing and sales policies will be broadened.

The Goodyear Tire and Rubber Co. takes pride in its "Silent Baseball Team." This odd organization is composed of deaf mutes in the employ of the company. The team has won 12 out of 16 games. The players have a strong following among their own people and receive much encouragement from the "silent" fans, who "root" in their own peculiar manner, by signs.

The Broadway Tire Exchange Co., Inc., Providence, has changed its name to Miller's, Inc., and has increased its capital stock from $10,000 to $100,000.

The Gates Rubber Co. has increased the guarantee on its Gates half-sole tires from 3500 to 5000 miles.

The Standard Tire Co., Willoughby, O., has declared a 50 per cent. stock dividend out of the surplus. The common capital is being increased to $1,000,000 and the preferred to $500,000.



Deaf Mutes on Goodyear Team.

The Middletown Rubber Co., Inc., has been organized with $1,000,000 capitalization by Chicago and Cleveland tire people and will erect a modern plant at Middletown, N. Y., to produce high grade "Middletown Cord" casings, inner tubes and all other rubber products. Myron J. Friedman, who operates large tire companies in Chicago and vicinity, is president. Associated with Mr. Friedman are William Rusnak, Chicago, owner of the Edison Tire and Rubber Co., as vice president; J. T. MacDonald, Cleveland, formerly with the Ideal Tire and Rubber Co., treasurer and general manager; S A. Thompson, Cleveland, formerly with the Firestone Co., secretary, and T. W. Decker, Cleveland, president Hardman Rubber Co., director. The company has opened offices in the Stewart building, 280 Broadway, New York City.

The Lee Tire and Rubber Co. directors have approved an increase in the capital stock from 100,000 shares to 150,000 shares. Hornblower & Weeks has underwritten 40,000 of the new shares at $30 a share and will offer them to stockholders at $33 a share. The sale of the stock will increase working capital, wipe out the indebtedness to banks and provide funds for expansion. The 10,000 shares remaining will be offered to employees on a profit-sharing plan, the stock being held in trust for three years and the employees having five years in which to pay for it.

The Goodyear Tire and Rubber Co. plans to offer $40,000,000 seven per cent. cumulative preferred stock. The proceeds will be used, as far as is necessary, to retire, by exchange or redemption, two outstanding issues of preferred stocks.

The Racine Rubber Co. will build 200 modern houses for the employees of its factories at Racine, Wis. The company recently purchased a 60-acre tract of land near the plant, and this will be used exclusively for employees' houses. The tract has been laid out in lots 40x100 feet and the houses will be built in double-detached style. The development will consist of 10 distinctive styles of houses. Employees are highly pleased over the plan and the houses will be occupied as fast as erected.

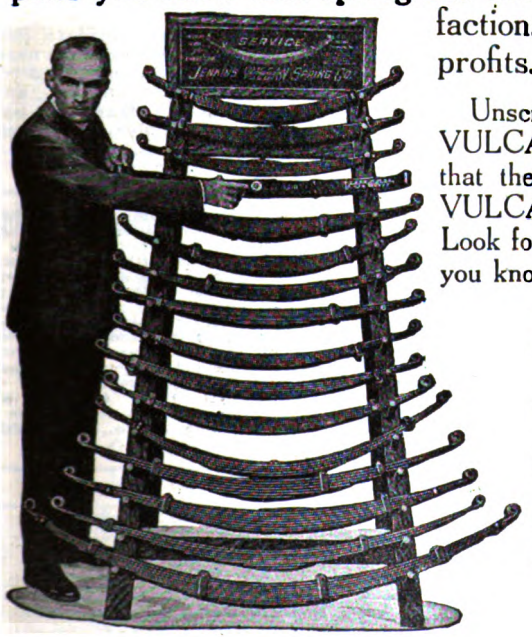
VULCAN

QUALITY

The Replacement Spring

The VULCAN Name-plate
insures absolute protection to the dealer.

When you sell a replacement spring bearing the round VULCAN name-plate you know that spring has been made right and will give complete satisfaction. It protects your future business and your profits.



Unscrupulous jobbers have substituted inferior springs for VULCANS, in the past. We want every dealer to realize that the VULCAN name-plate is his assurance of real VULCAN quality and VULCAN profits, which are high. Look for the name-plate on every spring; when you find it you know you're right.

The VULCAN name-plate is a symbol of Protection and Profit to every dealer.

AUTHORIZED Ford AGENT
THE UNIVERSAL CAR

SERVICE AND PARTS

912-916 W. UTICA ST., Cor. BRAYTON
BUFFALO, N. Y. Bell. Tupper 4000

August 11, 1919.

The Stenman Electric Valve Grinder Co., Inc.,
43 Southbridge St.,
Worcester, Mass.

Gentlemen:-

Replying to your letter of August 9th, would say it affords us much pleasure to send you our check to cover the cost of the Electric Valve Grinder sent to us for trial a short time ago.

We have no hesitation in stating that we have tried three or four other different makes of grinders, and consider yours much superior to any of them. Its smooth, velvety action enables us to make a much nicer job than any other valve grinder we have tried.

HHH/FM Yours very truly,

HALL MOTOR COMPANY,
Per Harry H. Hall

The moral from the above letter, is that you insist on getting a "Stenman" and accept no other. "As good or better" has not yet been made. Your jobber can supply you—if not—write to —us. Circulars on request.

Made under U. S. Patents 876,449 1,313,490. Others pending.

"Will Pay 300%"

The Stenman Electric Valve Grinder will pay 300% yearly on the original cost where it is used to grind but one set of valves a week. If used more the returns will be proportionately greater.

"They Serve Best Who Are Best Equipped To Give Service"

The Stenman Electric Valve Grinder is the greatest time and labor saving tool that ever went into a repair shop. It is eight times quicker than hand work and does a better job. Thousands are already in use and you can depend on this wide use as a guarantee of its worth. Order one today from your jobber. It will have practically paid for itself before the bill is due.

Price $40.00—F. O. B. Factory

CURTIS AIR FREE FROM OIL — MOTORISTS Have CONFIDENCE IN THIS SIGN

LET THEM FIND IT AT *YOUR* DOOR.

Curtis Air means more mileage, because Curtis is the only air compressor that can't flood cylinder with more oil than it can use. Oil is the enemy of rubber. It rots tires, causing blow-outs.

A Curtis Compressor Is Dependable

requires practically no attention, costs very little, quickly pays for itself, always delivers the kind of cool, clean air that makes tires last longer.

5 sizes and 125 combinations. Write for full particulars and let us tell you why the Curtis will prove to be your best investment. Ask your jobber for prices—but be sure and mention Curtis—the name is your protection against substitution

Branch Office: 531A Hudson Terminal, New York

For Ford and Metz Cars

Anderson Automatic Air Adjuster

It will add to mileage and greatly increase the power.

With a low throttle the engine will run strong and smoothly.

It will make a high grade efficient carburetor out of an old one.

In a few weeks it will save more in gas than what it costs.

List Price $6.50

DEALERS: This is a quick, sure seller, and the discounts are liberal. Write for facts.

ANDERSON & CO.

Waltham, Mass. *Manufacturers*

Arrow shows attachment on a Ford carburetor.

GENEROMETER

The new and practical generator testing instrument. It will locate shorts and grounds in generator armatures where most of the trouble is of a Lighting System. You will need this instrument if you want to be 100% efficient in your electrical repair work. Further particulars upon request.

PAUL G. NIEHOFF & CO., INC.

232 E. Ohio Street, Chicago, Ill.

Ni-hoff Laminated Magnetizer

This is the most scientific and practical Magnetizer ever constructed. It will magnetize any size magnet from a Ford to all the various other magnets used on the different cars today. Due to the fact that it generates an enormous amount of magnetism, with a pulling power of about 75 pounds, you can more quickly remagnetize a magnet, and, therefore save much current. All magnetizers are subject to considerable wear. The faces will wear down according to their use. The top pieces of our Magnetizer are especially hardened and also detachable so that when worn down they may be replaced at a very small expense. We have two types; one for 6 volt storage battery and another for 110 volt D. C. current. Write for further information.

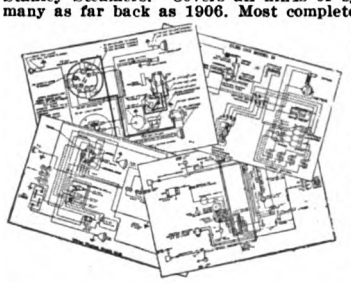
850 WIRING DIAGRAMS

In New Edition of Auto Electrician's Guide

Contains wiring diagrams for every car on the market, including the new 1919 Starting and Lighting Systems for Ford cars, also diagrams for Baker R & L and Detroit Electric and pipe connections for Stanley Steamers. Covers all kinds of systems from 1912 to 1919 and many as far back as 1906. Most complete diagram book on the market.



Highly Endorsed by Auto Manufacturers, Garages and Service Stations

No problem too puzzling if you have the Auto Electrician's Guide. ANY "OLD STICKER" QUICKLY SOLVED with the help of this book. Saves hours of time on both old and new jobs. Impossible for even experts to know all cars, but no car will "stick" you when you have this book.

A practical, easily understood "guide" that will simplify all auto-electric problems and make it possible for you to quickly overcome hundreds of starting, lighting and ignition troubles which otherwise would take hours to solve. Extensively used all over the country. Hundreds of auto experts and repair men depend on it to solve hardest problems. Dozens of letters received telling of its exceptional value.

A Loose Leaf Book

—easy to handle and easy to add new diagrams as issued. Convenient to slip into the coat or car pocket and invaluable as a constant companion to repairmen. Scores of trouble cases quickly and easily corrected with the help of this guide. Send today.

Price $7.50. Remit by Post Office money order or bank draft. Money refunded if not satisfactory.

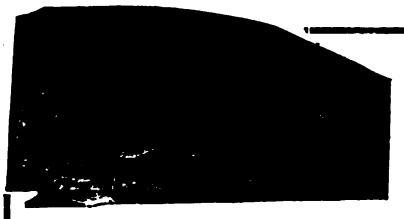
INDIANAPOLIS, INDIANA



KENNEDY AUTO STORAGE COVERS

"Wrap Up" Your Cars When Not in Use

When you store your car for a season, don't let its polish be dimmed by dust, and its metal tarnished before it gets out of the garage. Cover it at once with a KENNEDY AUTO STORAGE COVER, and it will remain as clean and bright as washing makes it, until the cover is removed, next day or next season.

Protects the limousine all summer, or touring cars through the entire winter season. No cost but first cost. Never wear out if care is taken in handling. Insist that your garageman use them.

Popular for Use and Sale in Every Garage

Garagemen—Charge extra for storing with KENNEDY AUTO STORAGE COVERS. Service your patrons are glad to pay for. Many will demand it.

Made of strong, heavy paper, reinforced to prevent tearing. Protects a car against dirt, dust and moisture. Prevents polished portions from tarnishing and keeps finish from checking in cold weather, and also prolongs the life of the tires by excluding the light. Furnished for 5 and 7 passenger gasoline cars, electrics and Ford cars. Good profits in retail sales and service use. KENNEDY COVERS can be sold at a season when trade on other accessories is usually light.

Write for Free Illustrated Literature.

How About the Part of the Car That is Out of Grease

Dixon's Lubricant clings to gear teeth when they are not in motion as well as when they are moving.

Ordinary grease slides off the gears when the car is standing, leaving the metal surfaces unprotected when the car starts.

DIXON'S GRAPHITE Transmission and Differential LUBRICANT

protects your gears all the time.

Put Dixon's Lubricant in your customers' transmissions and differentials. They will feel the difference when driving and gear shifting.

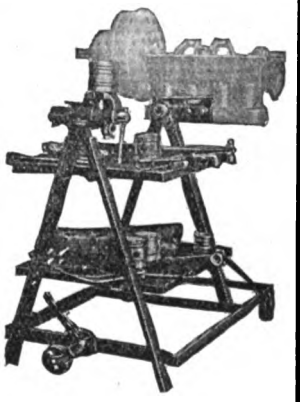
EKERN'S PORTABLE WORK BENCH AND ENGINE STAND

An equipment specially designed for Ford repair shops, having the combination features of Ekern's Motor Stand and a work bench.



Has two trays, 22x24 inches, for tools, engine and axle parts. Is mounted on three four-inch diameter wheels; the rear caster can be raised by pulling the plunger jim and the stand placed on its legs. When the caster is kicked down it will lock automatically and the stand will be carried on its wheels.

The Ford engine block is secured to the stand by two cap screws that hold the water inlet connection, and the block can be revolved in the clamp and locked in any position with the clamp screw.

The bench is equipped with a machinist's vise having a three-inch jaw and four-inch opening, which will take any work for Ford car overhauling, or other work.

The equipment is 36 inches high and requires 27x42 inches floor space. The axle attachment can be used with this stand. Weight, 120 pounds.

List Price, with Axle Attachment.....$46
List Price, Without Axle Attachment.....$40

NEW YORK
AUTOMOBILE REPLACEMENT
IGNITION COILS

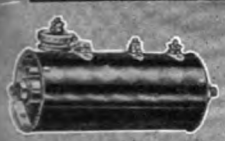
New York Automobile Replacement
IGNITION COILS

New York Automobile Replacement Ignition Coils have actually put hundreds of the smaller Garages and Service Stations in business—and are today the most treasured line of the largest Service Stations throughout the U. S. The explanation is simple. Most drivers have learned that the best car and engine fitted with the highest grade carburetor and workmanship cannot deliver its full power, smoothness or service unless the Ignition Coil delivers more than "just a spark."

Weak, partly broken down coils spoil owners' pleasure and temper, also your reputation, and the car's utility. A special New York Coil engineered to suit the exact requirements of each car manufactured—that will fire the poorest gas—that positively will not "miss" at highest engine speeds and rival magneto ignition is available.

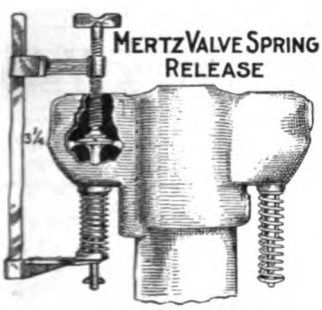
They are installed with no trouble in ten minutes, as they positively fit each car. Fifteen years of successful coil building experienced by an organization of Ignition Specialists, is the reason a car owner always agrees when told he needs a New York Coil.

More real profit, less come backs and easier made sales than any article you ever handled.



NEW YORK COIL COMPANY

338-340 Pearl Street **New York, N.Y.**



Adapted to any engine. Leaves both hands free to remove the key or pin.

MERTZ VALVE SPRING RELEASE

The Mertz is no ordinary make shift tool. There are no chains, notches, levers or springs. It is special tool equipment made for a distinct use and a guaranteed high quality product. The Mertz is easy and simple to operate. It locks automatically to any length. It will not bend the valve stems. It will easily compress the strongest valve spring made. It is unbreakable, very light and occupies but a small space in the tool chest or box. For emergency service it can be used as a clamp in general work and when tires or tubes are being repaired.

IT SAVES TIME, LABOR AND EFFORT. A TOOL FOR SHOP AND CAR.

To operate, place the Fork of the Release straddle of the Valve Stem under the spring. The self-centering gauge at the top of the Fork makes it adjustable to any valve spring seat. The hand screw is then turned and the arm becomes instantly locked. The valve head is positively held down in place while the spring rises. All other operations are as positive.

Mertz products are a good line for any dealer to sell. Utility tools that serve and save and are sold at the right price and afford the trade the right profit.

List Price, $2.00. Jobbers and Dealers Discounts at Request.

Boost your profits—Swing the big profitable welding business to your shop. Thousands of repairers are doing it and most of them use a Waterhouse outfit.

Time is money and a Waterhouse Welding Outfit saves the time as well as labor. It affords utility great enough to meet any shop requirement, yet no shop is too small to own one.

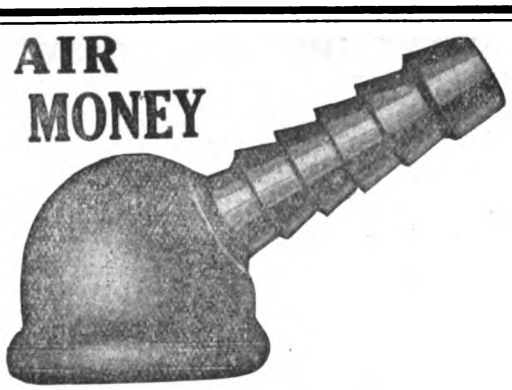
The great difference in welding outfits is all in favor of the Waterhouse. That means quality, utility, long service life, simplicity, dependability, low first cost and the best and most complete welding apparatus ever offered to the trade.

Write for descriptive catalogue, or better still, tell us your requirements. Do it today. We can supply the exact outfit for your needs.

All Waterhouse outfits are guaranteed.

WATERHOUSE WELDING COMPANY, 3 PELHAM STREET, BOSTON, - MASS.

FREE AIR COSTS MONEY



when the customers for whose convenience you provide an air station forget to turn off the flow after they have filled their tires.

Guard against this waste by attaching a

Schrader Universal Inflating Valve

to your air hose.

Thanks to this appliance your bottled air locks itself into the tank the minute it is taken off the tire-valve. You turn on the air by pressing the nozzle of the inflating valve against the tire-valve and you turn it off by removing the device from the tire-valve.

Made to fit any diameter of hose from ¼ in. to ⅝ in.

PRICE $1.50 in U. S. A.

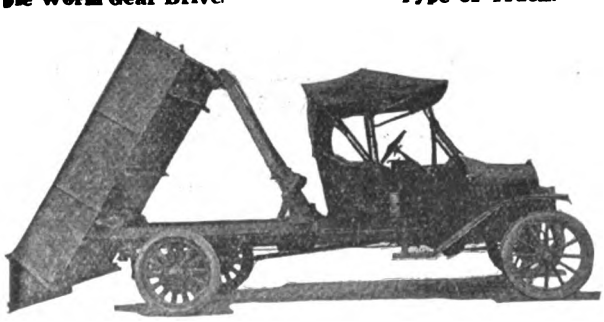
Manufactured by **A. SCHRADER'S SON, Inc.**
800 Atlantic Avenue, Brooklyn, N. Y.

Schrader products were awarded a Grand Prize and two Gold Medals at the Panama Pacific International Exposition. "There's a Reason."

THE PEERLESS HAND HOIST

Single Cable Quadruple Worm Gear Drive.

For Any Make or Type of Truck.



A wonder in efficiency and speed. It will fit any chassis and body. Weighs but 200 pounds. Simple, fool proof, wholly dependable and will last for years in the hardest service.

Any one that can drive a truck can hoist the heaviest load to 30 or 50 degrees in the longest body in less than two minutes. The smaller the body and load the quicker the action.

But two gears are used, quadruple worm and gear (both machine cut) and housed to protect from dirt and dust. The single cable makes an even pull. Compact and can be installed without drilling holes in chassis frame. The body hitch is also furnished.

We specialize in building all-steel bodies for any need.

DUNTLEY
MAGNETO BREAK
TIMER

FOR ALL FORD CARS

Guaranteed to Deliver 50,000 Miles of Efficient Service

The Duntley Magneto Break Timer Eliminates Ignition Troubles and Insures Maximum Motor Efficiency and Economy.

Perfect ignition can be attained only through positive contact and a clean break. In the Duntley, the electrical current is closed by Tungsten points in positive contact, not through a greasy roller jumping and skipping across a metal segment.

The only parts in motion sufficient to cause wear are the rollers riding on the operating cam and they are made of a special fine grain, hard pressed fiber that is oil and water proof and practically everlasting.

FOR FORDSON TRACTORS

The following letter from a satisfied user shows how the Duntley delivers 100% on the Fordson.

"The timer you sent . . . . is all you claim for it. It certainly gives the tractor twice the power it had before and also is a saver of fuel." Name on request.

SOLD ON AN ABSOLUTE MONEY BACK GUARANTEE

Security Auto Lock

Affords every protection to Ford car owners that a perfectly designed and extremely well made lock can give. While neat and attractive it is built very strong. In operation it is positive and the car can be left with a feeling of confidence that no one but the owner can use it.

It is the original loose wheel lock for Fords.

It is approved by underwriters.

It will reduce insurance premiums 15%.

When locked the car cannot be towed.

List Price, $6.00

It makes the Ford thief-proof

Anyone can easily install the Security in ten minutes. No drilling, filing, sawing or chiseling necessary. It is made of solid brass. Nickel plated finish.

TO DISTRIBUTORS

When this lock is shown no other will satisfy Ford car owners. It sells at sight. Our trade discounts are liberal and our proposition will interest any one that can sell high grade car protection at a moderate price. ***Write for details today.***

GARDNER AIR PUMPS

Result of 50 years manufacturing experience.

An inefficient air pump makes your air service expensive.
It hurts the quality of your service.
Makes a customer dissatisfied and hurts your business generally.

Install a GARDNER

It will pay for itself in a short time.
It is simple, rugged and efficient.
The fact that many filler stations supplying hundreds of car owners daily use the Gardner air pump is proof that experience had demonstrated it is economical.

SCOE

Formerly "Dave Buick" Carburetor

Puts "Pep" In Your Ford. Saves Its Cost In 60 Days.

Try This Carburetor Before You Sell It

THOUSANDS of dealers all over the country are building up a remarkable business with the Scoe Carburetor. The fact that the Scoe Carburetor does give greater gasoline mileage, more speed, quicker pick-up, perfect slow running, easy starting, and cleaner cylinders and spark plugs, makes it a ready seller.

We know that there is just one way to convince you these facts, and that is by seeing them for yourself—your own business.

Dealers' 30 Day Trial Plan

want every automobile dealer and service station to w the Scoe—for to know it, is to sell it. There is a al discount to the trade.

the trial order coupon and we will ship you a cartor for thirty days' trial. Half the net you pay, bale in thirty days if satisfied. If not, return the cartor and we will refund your payment without a ques-. Here is your opportunity to see the remarkable g features of the Scoe at our expense.

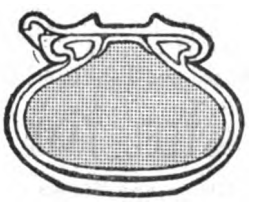
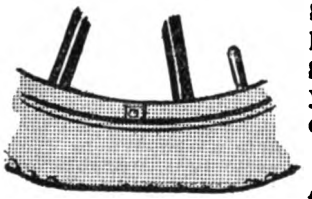
(3)

Proper Inflation is Tire Salvation

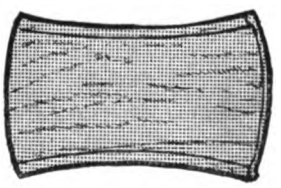


Under-inflated tire. Note the strain on the bead and side walls. Rim cutting and broken down side walls are bound to result from this abuse.

Loosened tread—another example of under-inflation.



Almost flat—imagine the injury to your car, the cost in fuel and oil—carbon accumulation and general discomfort every time you go over a rough place.



Look at the cracks. No wonder the best tires are only guaranteed for 6,000 miles. If you kept Whistlers on them, you'd get nearer 9,000.

Look at these examples of tire-misery caused by under-inflation. Nearly all blowouts are caused by over-inflation.

Why don't you put a stop to tire trouble? Put the

Whistler

TRADE MARK

"IT WHISTLES WHEN ITS HAD ENOUGH"

on all your tires. You can't make a mistake, for a cheery little *whistle* says when—and the valve automatically closes.

You'll save 50% to 75% on tires—20% gasoline—66⅔% pumping time (no gauge nuisance) and you have a better car with less repairs.

That's the story that's selling Whistlers. And they *are* selling with a boom! Repeat orders coming in show better than any words how the Whistler has made good with jobber, dealer and consumer.

Here it is —Screw it on

The Automobile Journal

A QUALITY MAGAZINE, WITH PRESTIGE AND CIRCULATION THAT BRINGS RESULTS TO ADVERTISERS

TIMES BUILDING :: PAWTUCKET, R. I.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUG. 24, 1912, OF

THE ACCESSORY AND GARAGE JOURNAL,

PUBLISHED MONTHLY AT PAWTUCKET, R. I.

For Oct. 1, 1919.

State of Rhode Island, County of Providence.

Before me, a Notary Public, in and for the state and county aforesaid, personally appeared William H. Black, who, having been duly sworn according to law, deposes and says that he is one of the owners of the Accessory and Garage Journal, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the act of Aug. 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse of this form, to wit:

1. That the names and addresses of the publisher, editor, managing editor and business manager are:

PUBLISHER, WM. H. & D. O. BLACK....Pawtucket, R. I.
EDITOR, E. B. NORTON.....Providence, R. I.
MANAGING EDITOR, FRED E. BLACK..Pawtucket, R. I.
BUSINESS MANAGER, WM. H. BLACK..Pawtucket, R. I.

2. That the owners are:

WM. H. BLACK.....Pawtucket, R. I.
D. O. BLACK.....Pawtucket, R. I.

3. That the known bondholders, mortgagees and other security holders owning or holding one per cent. or more of total amount of bonds, mortgages or other securities are:

M. J. BLACK, Mortgagee.....Pawtucket, R. I.

4. That the two paragraphs next above, giving the names of the owners, stockholders and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company, but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association or corporation has any interest direct or indirect in the said stock, bonds or other securities than as so stated by him.

(Signed) WILLIAM H. BLACK, Co-Partner.

Sworn to and subscribed before me this 7th day of October, 1919.

(Signed) CHARLES McALEVY, Notary Public.
[Seal] (My commission expires June 30, 1920.)

M. & E. GREASE CUPS

"THEY STAND THE GAFF"

(Patented)

ROUGH and uneven roads test the efficiency of grease cups. The rattling and jars will loosen the tops of ordinary grease cups and allow sand and grit to enter the grease. The result is worn bearings.

Equip your Trucks and Pleasure Cars with the reliable "M & E" Ratchet Locked Grease Cups. The tops will not work off from vibration, which assures clean, free flowing grease.

The FWD military trucks are equipped with "M & E" Grease Cups.

Made of Steel and Brass.

Write to Dept. 2 for samples and prices.

This SET of Reflex Spark Plugs fired for FIVE YEARS without CLEANING

Not once during this long life, in a car used practically every day, was there an interruption of hot, sharp sparks essential for steady power. At no time was there oil to be wiped or carbon to be cleaned from the points of these plugs to **maintain** that full efficient operation of the motor.

To quote from the letter of this Reflex user *, "This is the fifth year that I have used the **same set** of Reflex Spark Plugs in my (name of car) without cleaning and they are **still in good condition.**"

The fact that a SET of Reflex Plugs performed this—not a certain ONE—is further evidence of the consistent performance Reflex dealers sell to their customers when Reflex plugs are recommended.

It is additional proof that the exclusive Reflex construction of cromite war service porcelain and non-pit electrodes actually produces, without attention, the unfailing ignition your customers must get before they can expect snappy, trouble-free, engine operation. You can build up the same good business on the record of Reflex past performance that other Reflex dealers have done. Remember, every plug of the complete Reflex line comes to you guaranteed.

A post card will bring you details of the better Reflex dealer proposition. Drop a line today.

ATSCO PORTABLE AIR TANKS

MAKE YOUR EMERGENCY CAR A PAYING SERVICE CAR

For Road Repairs

It Saves All Wasted Time and Labor

For every road job on tires. A turn of a valve and the tire is almost instantly inflated. It's a 100 per cent. efficiency equipment, inflation is positively to standard with a pressure gauge, and 99 per cent. of the time and labor necessary with a hand pump is economized.

The job is worth more to the owner, because it is perfectly done.

The Atsco tank is equally as useful and economical in the service station.

It is the only equipment for pneumatic tired trucks, for it saves valuable vehicle time should there be need of a tire change. Carry a tank in the machine at all times.
Atsco tanks can be filled at any compressor system. They are light, 36 inches long and 10 inches diameter, and are constructed with genuine copper brazed seams. Good for 250 pounds working pressure or 500 pounds test pressure.
The equipment includes an eight-foot hose, a standard tire filling valve, and a protection valve for filling with a compressor system.

List Price $24.50, f. o. b. Pittsburgh, Pa.

We specialize construction of garage pressure tanks, and have in stock or build to specification tanks of any size or pressure requirements. Our tanks are used by most of the producers of compressor and air storage systems.
These tanks are genuine copper brazed construction and the seams and joints are far stronger than the stock metal. They will not crystallize or crack and are guaranteed air tight.
We make pumps and pressure tanks for all purposes.

Dealers Like Perfection Motor Car Heaters

With the great increase in winter driving there is a big consumer demand for Perfection Motor Car Heaters both in open and closed cars. The ease of installation and efficiency of service opens for dealers a wide market among cars not originally equipped with Perfection Heaters.

It is both to the dealers' and manufacturers' interests that cars be used twelve months in the year. Every car equipped with a Perfection Motor Car Heater is used throughout the year.

Attractive territory is open to distributors and dealers and we can now take care of all needs of car manufacturers. Production in our new factory is over 600 Perfection Motor Car Heaters per day.

Write immediately for descriptive literature and terms.

WHO'S BOSS-

THESE COLD DAYS?

DON'T "ARGUE" WITH YOUR CAR ABOUT STARTING

A COPLEY PRIMER

Settles it for all time — when you say "go"---you GO!!

That is what sells them and it is the whole story. It is the only selling talk needed or necessary.

There is always a regular demand for Copley Primers, but the call in winter months makes it a wonder line wherever sold.

It has won it's way to owners **AND CAR** BUILDERS through proven superior utility, dependability and service. The qualities and merits of this equipment have created a demand that yields big and constant returns to all Copley Primer dealers.

It Will Start Any Motor Instantly Any Time

With a Copley Primer heat or cold cannot effect the starting of the engine. It is not a make shift attachment, affording guess work results—but regular standard, highly developed car equipment of the highest order, which guarantees added engine efficiency, service and economy.

The Copley is Standard Equipment on Mitchell and Templar Cars

NO OTHER PRIMER IS TO BE COMPARED with the Copley. IT IS DISTINCT AND IN A CLASS BY ITSELF.

The Copley Primer positively and continuously supplies the cylinders with a carbureted spray of fuel perfectly mixed with air. The Venturi nozzle used makes this possible and certain. With the Copley the explosive mixture is delivered into the manifold—at the right place—near the engine valves.

The illustration shows how a small flow of gasoline can be injected into a stream of air moving at extremely high velocity. The liquid being thoroughly atomized by the air which produces a perfect charge. The Copley Primer is so perfected that any engine can be operated without a carburetor and with any grade of gasoline.

It will afford every degree of efficiency on any motor. That is why every user is a booster and why every sale brings new customers. The Copley is easily and quickly attached and the service life is good for years.

If you do not sell Copley Primers it is because you do not have them in stock. You lose because the demand is constant and urgent. Why merchandise slow money lines when you can sell necessary equipment that is conceded to be the winner of the year?

BRUNNER

Remember When

the future of the garage business was very uncertain and the proprietor could put his garage equipment in a hand bag? The little machinery bought was usually on a price basis. The cheapest that would do the work. Permanence, durability and economy was little considered. Everything was cheap in those days, so operating costs were not seriously thought of.

The permanence, progress and prosperity of the garage business has put old time equipment, methods and ideas in the morgue ever to remain. To-day scientific methods, approved practices and the best machinery money can buy is the rule everywhere.

Brunner Air Compressors more than fulfill the present day demand.

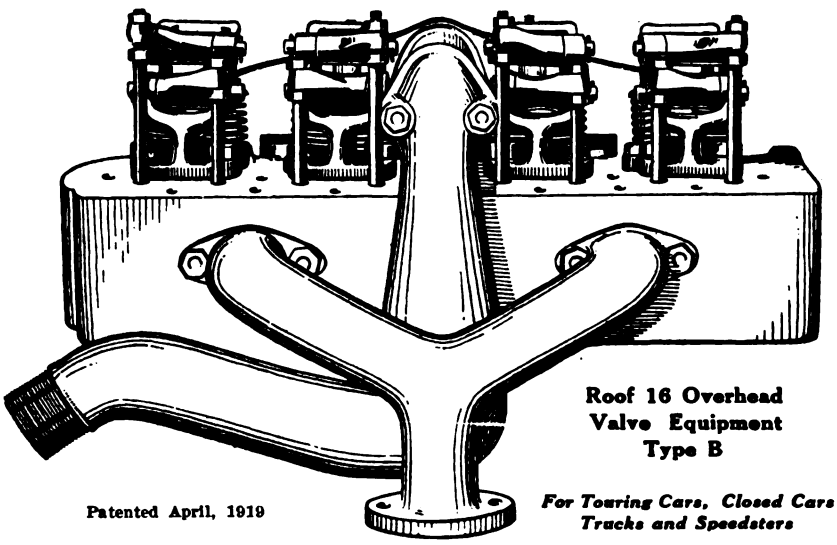
POWER and SPEED ROOF 16 OVERHEAD VALVE EQUIPMENT for FORD MOTORS



Roof 16 Overhead Valve Equipment Type B

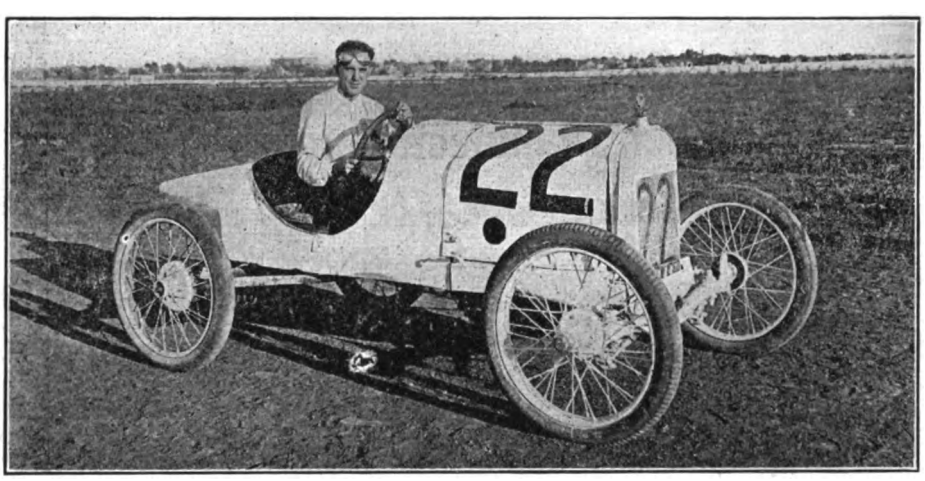
For Touring Cars, Closed Cars Trucks and Speedsters

Patented April, 1919

The Most Remarkable Power Device, Even in This Inventive Age

Hill climbing for touring cars—pulling power through sand and mud—doubles the hauling capacity of converted Ford truck-speed for mile and half-mile tracks to rival the fastest cars built. Ford racing cars with our Cylinder Head Equipment and special racing parts have attained speeds from 80 to 100 miles per hour. Hill climbing and pulling power for touring cars, closed cars and trucks. Price, complete, $115.00 f. o. b. factory. Nothing extra to buy. Cylinder head equipment all ready for installation. It takes the place of the regular Ford Cylinder Head. Any mechanic can easily and quickly install it.

Comparison Brake Horse Power Tests at the United States Bureau of Standards gave Standard Ford motor with regulation carburetor 18.7 Horse Power. The same motor with 16 Valve Head and regulation carburetor 22.4 Horse Power. The same motor with 16 Valve Head and Special carburetor 29.7 Horse Power. Recent tests at Bureau of Standards with Type B gave 32 Horse Power. We are Manufacturers and Distributors of speed and other specialties for Ford cars; 3 to 1 gears, high speed camshafts, aluminite, light grey iron pistons, lynite pistons, aluminite connecting rods, racing spark plugs, racing carburetors, roller bearings, counterbalances, wire wheels, multiple speed transmission, high tension magnetos, special oiling system, special worm and gear, steering gear, racing tires, racing bodies, hood and radiator, parts for underslinging chassis. Tell us what you want. We can supply it. Racing quality. Lowest prices. Send for our Complete Literature on how to build fast cars and double the value of your converted Ford Truck and descriptive circular on Speed and other Specialties for Fords.



MR. KIRBY HORTON,
CLEBURN, TEXAS,

a great driver and mechanic in his record breaking Ford. Mr. Horton obtained a speed of 80 miles per hour on a straight away and is a winner of many races on mile and half-mile tracks. His Ford motor carries the Roof 16 Valve Cylinder Head Equipment.

Ford Racing Car Speed Kings

From the hundreds of fast Ford car drivers we mention the names of a few of those who have won laurels through the use of our equipment and some with speed records approaching that of the highest priced racing cars in the world, ranging from 70 to 97 miles per hour, and who on mile and half-mile tracks have closely approached the world's record with their speed cars:

PEERLESS AUTOMOBILE SPECIALTIES

MAKE OLD CARS LOOK LIKE NEW

The attractive package is a big selling point. Can has friction top so that the lid can be pried off and sealed again if desired. This style of can permits the goods to be used direct from original package, preventing any waste by emptying into another container.

PEERLESS MOHAIR TOP DRESSING.

A dressing that not only waterproofs, but dyes a mohair top with one application, making top look like new.

PEERLESS LEATHER TOP DRESSING.

An oil preparation which renews and softens the leather, rubber, pantasote and their imitations. Dries with a bright finish and wears indefinitely.

PEERLESS JET BLACK FENDER JAPAN.

A finishing for fenders, which will cover solid with one coat, making a jet black gloss enamel finish similar to a baked job.

PEERLESS CARBON REMOVER.

Will remove carbon from cylinders of automobile motors and keep them always active and full of life. Will eliminate the carbon knock and make driving a pleasure.

PEERLESS MIRROROID.

Not a polish, but similar to a regular varnish, which will give a surface of a car where used a finish like a newly varnished job.

PEERLESS BATTERY BOX BLACK.

An acid-resisting enamel which will protect wood or metal parts of battery boxes, cases and racks which come in constant contact with acid from batteries from decay.

PEERLESS EXTRA FINE BLACK JAPAN.

A fine product for all around use on wood, metal and old enameled parts of an automobile. Will cover solid on any surface which is free from grease or dirt.

PEERLESS GASKET SHELLAC.

A high grade product cut in pure alcohol for gaskets, corks, carburetor floats and such parts of an automobile. Heavy bodied so that it makes a perfect seal on worn gaskets as well as new ones.

PEERLESS CYLINDER ENAMEL.

When cylinders and all metal parts of an automobile underneath the hood of an automobile are coated with this enamel they can always be kept clean and there is no danger from rusting. Made in Black and Gray.

PEERLESS TOUCH-UP BLACK.

A quick drying product for all around use in touching up all metal and wooden parts of an automobile, where finish is worn.

PEERLESS CUSHION DRESSING.

A dressing that can be relied upon to be perfectly safe to use as it does not wash or rub off and renews the appearance of old leather seats and cushions.

PEERLESS RIM PAINT.

Rims coated with this paint will not rust, thus preventing tires from sticking, which injures the casings. May be used on rubber mats as well as casings.

PEERLESS FORD TOP DRESSING.

Will restore original finish to leather material used on Ford cars. Where mohair is used on Ford cars use Peerless Mohair Top Dressing.

PEERLESS LAMP ENAMEL.

A gloss enamel which will stick on nickel, brass, iron or old enameled parts and is not affected by heat of gas lamps. Made in Gloss and Dull.

PEERLESS LIQUID WAX.

A hard drying Polish which is easy to apply with a light even coat, as it comes in liquid form. It is waterproof and will stand washings without dulling the finish.

PEERLESS TIRE PAINT.

A waterproof coating for tires to protect rubber from exposure to air, thereby saving rubber from deterioration and keeps tires looking like new. Made in Black, White and Gray.

PEERLESS AUTO BODY POLISH.

It is practically an oil varnish food, containing the necessary products that are needed by varnished surfaces that have become dull through service. Easily applied and ready for use at once.

PEERLESS LINING DYE.

A dye that will make all water-stained, grease spotted and faded linings of an automobile top a dark black uniform black color. Will not wash or rub off, neither will it stiffen or harden the cloth.

Prices on these PEERLESS AUTOMOBILE SPECIALTIES are as follows:

1 gal., $6.00. ½ gal., $3.15. Quart, $1.65. Pint, 90c. ½ pint, 50c.

PEERLESS COLOR FINISHINGS.

A line of eight colors so that an owner can select any combination of colors for wheels, chassis and body of his car. High grade colors made with a finishing varnish so that it is not necessary to finish over these colors. Made in following colors: RED, BLACK, WHITE, BLUE, GREEN, YELLOW, STRAW COLOR and GRAY.

1 gal., $7.00. ½ gal., $3.65. Quart, $1.90. Pint, $1.00. ½ pint, 55c.

PEERLESS AUTOMOBILE SPECIALTIES produce durable and lasting results that please every owner, giving dealers repeat orders and a good profit on each can sold.

Used by over 8,000 automobile painters because of their high qualities.

Dealers order these Peerless Automobile Specialties through your jobber, also get catalogs, window displays, inserts and other advertising matter. If his stock has not arrived, write us direct and we will see that you are supplied.

ACCURATE
to .00025 of an inch by Micrometer Test

Every mechanic knows—that if the opening in a piston ring can be closed positively so that it cannot leak—and at the same time provision is made for the necessary contraction and expansion—the ideal piston ring would be obtained.

The simple Burd Automatic Coupler does just that. It closes the gap effectively against leaks, and as the opening increases—automatically adjusts itself to cylinder wear—insuring gas and oil tight, high compression.

Burd Piston Rings are easy to install—fit accurately to .00025 of an inch—and require no filing or fitting. They are guaranteed against flaws and breakage.

Every Burd High Compression Ring is warranted to produce higher compression—develop more power, and use less gasoline and lubricating oil (when installed in cylinders that are not scored or warped), than any other piston ring made—and we will gladly refund the full purchase price—after thirty days' use—if they do not stand this rigid test.

Ask Your Jobber's Salesman—or Write Now

for a copy of 1920 Burd Piston Ring Directory of Sizes, price list and information about our Sales Helps for Garages and Repair Shops. Your jobber carries a complete stock of all sizes—and oversizes—to fill rush orders quickly.

MR. FORD OWNER

THERE'S Your Trouble- "Leaky" Wires

HERE'S Your Cure

Brown's Timer Wiring System for FORD CARS

is a direct overhead connection between the coil box and the commutator and positively saves the usual 40% spark waste, delivering to the motor the FULL INTENSE HOT SPARK. Regular Ford Wiring becomes oil and water soaked, the insulation frays, the wires become exposed and broken, causing "leaks" and short circuits. Brown's Timer Wiring System "SAVES THE SPARK", assuring continuous combustion, eliminates carbon trouble, saves oil and gas and prevents rippling of the commutator.

GILL

The Perfect One Piece Piston Ring

"Here Is the Piston Ring I Recommend"

The garage man says this with an accent of pride when he holds out a Gill Piston Ring towards the customer. He knows the Gill Ring only has to be shown to convince that it is the "perfect one piece piston ring." There is no argument necessary, one look at the double step interlocking joint and anyone with even the slightest mechanical knowledge can see that it is head and shoulders above any other ring on the market.

Just think for a moment. The Gill Piston Ring allows an expansion of from $1/8$" to $3/16$" without any loss of compression and at the same time has all the advantages of a one piece ring. Made from single piece castings of the finest gray iron and machined to absolute accuracy. The easiest ring on the market to install, the easiest ring on the market to sell.

Send for the new Gill Piston Ring Size Directory, complete, convenient, and full of just the information you need. It is free to the trade.

Keeps out an

You now can have real

Filtered Air

NOT A particle of dust—not a bit of dirt—not a drop of oil—in the air that goes into the tire from the No. 7 Filtered Air Outfit. This means a protection for tires—a protection that the motorist will appreciate—that is worth dollars to him. He will come to your place of business for this air service, enabling you to make many sales of your goods and to render "pay" service on his car.

This new No. 7 AU-TO AIR COMPRESSOR is a great business builder. You have something to offer that the motorist wants. You will find it a profitable investment right from the start—bringing you customers from all classes of motorists.

Only 3 Moving Parts

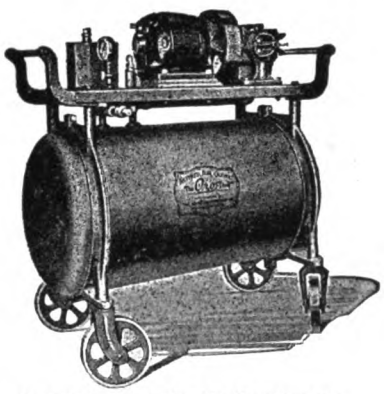
Consider this for simplicity—only 3 moving parts in the compressor mechanism proper. There is nothing to cause trouble, nothing to watch. The outfit is complete in itself. It will maintain a good supply of air day and night. When the pressure goes down the power switches on automatically; when the pressure goes up the power switches off. There is a gauge, an automatic unloader, and a perfect lubrication system that eliminates any possibility of oiling trouble. Only ½ h. p. motor. Sufficient pressure to handle the largest pneumatic truck tires.

Get the "Filtered Air" Outfit if you want to be up to date. This equipment is making a wonderful hit wherever it is being used. You should be the first in your community to have it. *Ask your jobber, or write us if he doesn't have it, sending his name.*

THE AU-TO COMPRESSOR CO.

303 S. Mulberry Street WILMINGTON, OHIO

Capacity over 4 Cubic Feet of Air A Minute



Model No. 8 Au-To Air Compressor —same as No. 7, excepting that it has large wheel casters, which make it easy to move from place to place in the shop or garage.

Easier Control and Longer Life for FORDS

SOMETHING more than the standard steering mechanism of a Ford car is needed to enable the driver to keep the car in the road without constant nerve-wearing effort. There are hundreds of thousands of everyday illustrations. Just pause on some corner and watch the Fords pass—observe how they wobble back and forth when they hit a bump or crease in the road. Note how the front wheels wobble and scoot, wearing out the tires and subjecting the entire front system and steering mechanism to a strain that results in worn-out parts and repair bills. Bear in mind also the danger of the steering connecting rod going over center travel from turning corners or short turns—the consequent loss of control, frequently causing accidents and serious damages, and sometimes the destruction of the entire car and the lives of the occupants.

Every Ford should be equipped with an OVER-LAND GUIDE

Because it is Life Insurance for Fords and Ford owners

It overcomes the difficulties in steering the Ford, and keeps the car or truck in place. Also removes the strain from the steering mechanism, as well as from the arms and shoulders of the driver.

When a Ford is equipped with an OVER-LAND GUIDE any driver can guide the wheel with the tips of his fingers, while the car or truck is in motion over the roughest roads without the danger of losing control.

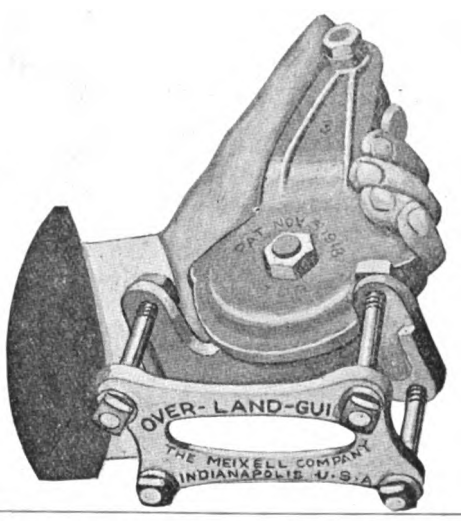
Saves at least ten times its cost in one year in repairs alone where the Ford or Ford truck is used constantly.

It must be apparent to you that the OVER-LAND GUIDE is a real "Safety First" device, besides of necessity for every FORD CAR or FORD TRUCK.

Sales are limited only by the number of FORDS now in service, or to be made. You have never had a more meritorious accessory to sell! Our "Liberal profit plan" will interest you. WIRE OR WRITE IMMEDIATELY FOR DEALER PARTICULARS.

Reduces Risk of Breakage and Repairs of following:

Spindle connecting rod (or tie rod). Spindle body arms and bushings. Spindle body and bushings. Ball and roller bearings and hub. Spindle connecting rod and ball joints. Steering gear ball arm. Steering post bracket, bushings and bolts. Steering post. Steering gear pinions. Steering gear drive pinion. Steering gear internal gear case and bushings.



THIS BROAD GUARANTEE PROTECTS YOUR CUSTOMER

The OVER-LAND GUIDE, properly installed, is guaranteed to do all we say. Your customers can use it for twenty days, and if at the end of that time they are not satisfied, money will be refunded upon its return.

The OVER-LAND GUIDE bolts to the center of the front axle and the center of the spindle connecting rod (or tie rod), securely relieving the vibration and strain in the spindle connecting rod (or tie rod) and entire front system, and the steering mechanism up to the steering wheel.

Victor Gaskets Dominate

OUR recognized leadership in the automotive industry to-day is due to our policy of holding steadfastly to the original ideals of specializing entirely upon copper and asbestos gaskets for internal combustion engines.

To meet the constantly increasing demand for Victor Gaskets we have just completed the largest and best equipped gasket plant in the world.

This new home is not alone a measure of wonderful progress since we made the first copper asbestos gasket eleven years ago. It is our assurance to the trade of an even better product and a continuation of the high type of service which is responsible for Victor domination to-day.

CYLINDER RE-BORING—

Quickly—Easily—Profitably Handled

If you are not getting your share of this business you are overlooking the biggest chance you ever had.

Marvel Cylinder Re-Boring Machine No. 5

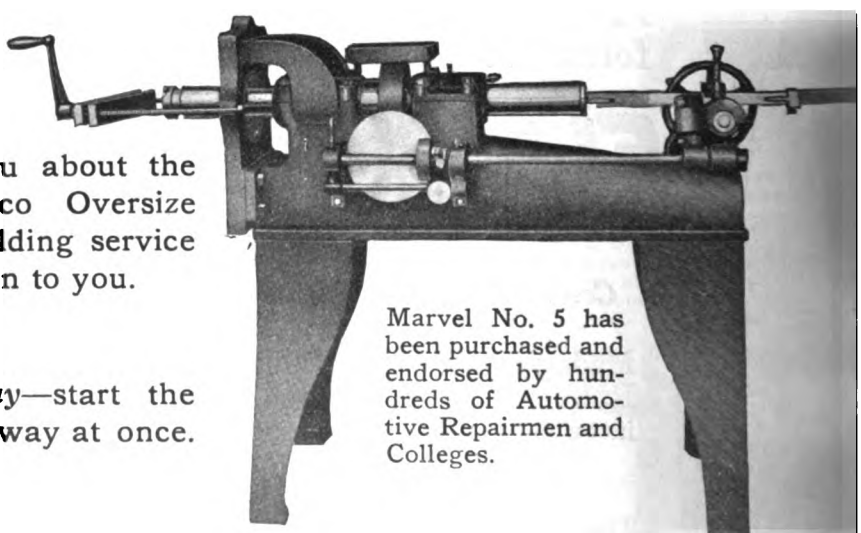
enables you to re-bore cylinders on any Gas engine from a Motor Cycle to a Tractor.

It is the most practical, convenient, substantial and accurate machine ever invented.

It has proven best by every test. It has speed and capacity. It is power driven and with its automatic feed release permits of a man doing other work while re-boring. It may be used for boring pulleys, gears, drive wheels and put to a hundred other uses.

Our co-operative Business Building Advertising helps you get the business—our Marcon Piston service helps you hold it.

You cannot go wrong with the Marvel—write at once for our proposition—we will gladly tell you about the Marvel No. 5—our Marco Oversize Pistons—our Business Building service and explain what they mean to you.



Marvel No. 5 has been purchased and endorsed by hundreds of Automotive Repairmen and Colleges.

OL. IX. PAWTUCKET, R. I., NOVEMBER, 1919 No. 7

Big Business Brought by Equipment Show

nnual Convention and Exhibit of Automotive Association at Chicago Most Important Event in History of Industry—New Constitution and By-Laws Adopted

HE big success from all points of view of the annual convention and first annual exhibit of the Automotive Equipment association, held in Medinah Temple, Chicago, Nov. 3-8, speaks no uncertain terms of the era of prosperity that is at hand for the automotive industries of America. The exhibit feature, which the association has never before attempted in connection with its annual convention, was a particularly successful departure, and will unquestionably become a regular concomitant of the annual meetings of the association in the future.

Manufacturers and exhibitors, without an exception, expressed themselves surprised and gratified at the volume of business transacted; in fact it is stated that never before was such buying power expressed in the automobile accessory trade in the same length of time as was manifested at this exhibit. Jobbers, dealers and buyers were present from all over the country in numbers never before seen at a show of this character, and they were all evidently present for the purpose of gaining valuable information, and in many cases were prepared to give orders to supply their needs in the expectation of a good run of business for the coming season. As the attendance was made up entirely of members of the trade and industry, the general public not being invited, exhibitors could be sure of not wasting energy on mere curiosity

General View of the First Annual Exhibit of the Automotive Equipment Association Held in Medinah Temple, Chicago.

Digitized by Google

View Down One of the Aisles, Showing Attractive General Arrangement of Booths.

seekers, but could talk on a business basis with all visitors from the outset.

The sessions of the convention were productive in bringing the various interests of the industry, manufacturing, jobbing and selling, into greater harmony, thus promoting the mutual welfare of each, and many perplexing questions were discussed and settled in a satisfactory way.

The building in which the convention and exhibit were held was well suited in arrangement and size for an event of this nature, although the management could have filled much more than the available space, as the number of applicants far exceeded all expectations. The greater number of the displays were on the lower floor, but overflow exhibits were located on the main and upper floors and some were on the stage, while the big auditorium was ideal for the sessions of the convention. The decorations, which were designed by Campbell Brothers of Boston, compared most favorably with those of the big national shows. The color scheme consisted of a Florentine setting embodying the high lights of the Italian school, which were contrasted with the deep green background which effectively offset the lighter coloring.

IMPORTANT BUSINESS TRANSACTED.

New Constitution and By-Laws Adopted.

National Budget System Favored.

Restoration of Railroads and Carrying Systems Favored.

Board of Governors Made Clearing House for All Questionable Advertising.

New Plan of Procedure Formulated by Standardization Committee.

Publication of Hand Book Authorized.

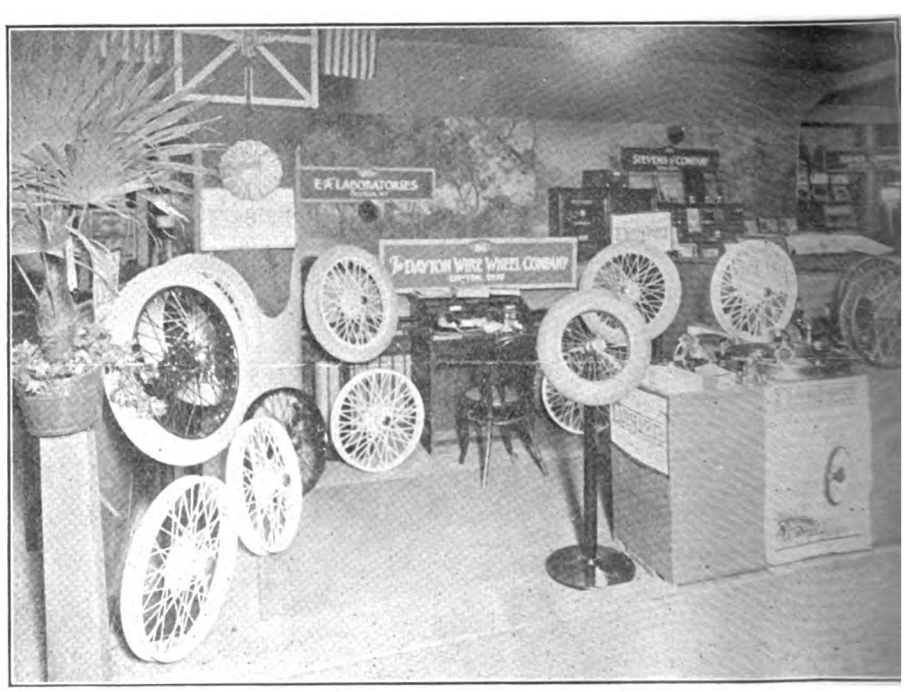
Classification of All Members of Association.

While both the convention and exhibits were open to members of the automotive trade and industry, no invitation to the general public having been extended, many of the matters discussed and action taken were of universal interest. Each session of the convention was opened by the playing of the national anthem, and invocation by the Reverends John Gibson and Rufus A. White, and each afternoon informal organ recitals were given by Professor Kurzenknabe on the fine organ installed in Medinah Temple, which is said to be one of the largest in the United States. This was a feature greatly enjoyed by many of the visiting members.

Mayor William Hale Thompson, who was on the programme to give the address of welcome, could not be present on account of unforeseen circumstances, but the city of Chicago was well represented by Harry B. Miller, the prosecuting attorney. After dwelling upon the progress and the spirit of good fellowship manifested in his city, he spoke of the great danger which has harassed the nation for some time and urged every member of the association to do his best individually to stem the tide of foreign influence of spreading Bolshevistic propaganda. He painted a picture of the reconstruction days that followed the Civil War in this country and by the way of contrast stated that the period of reconstruction through which the United States is now passing is of far greater moment than the former because of the very danger in which the life of this nation is put through the teachings of ill-advised professional agitators, who are trying to undermine the institutions upon which this nation has been built.

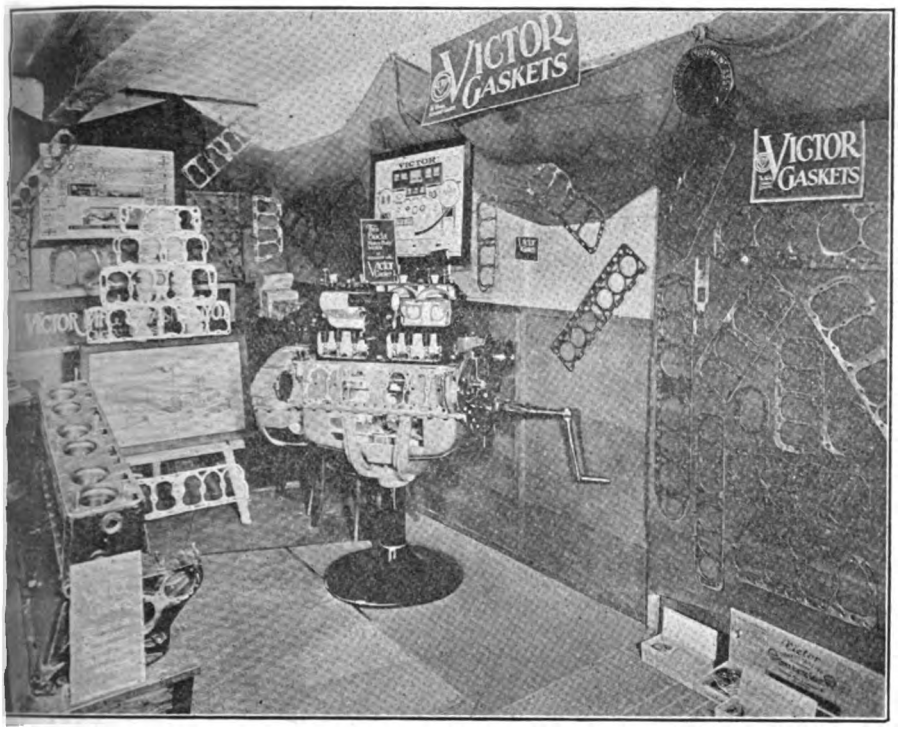
Wheeler Made Stirring Address.

Harry A Wheeler, formerly president of the National Chamber of Commerce of the United States, spoke of the activities of that body and also of the efforts made by the industrial conference summoned by President Wilson, of which the speaker was a member, in so trying to work out the problems submitted to them that capital and labor would both get a square deal, and expressed his regret that the conference was broken up because of the determination of a few of the board to stand by Americanism and nationalism, that the foundations of the institutions for which the forefathers bled and died should not be permitted to be sapped. He also suggested the need of financial support for the building of the home of the Chamber of Commerce of the United States at Washington, and for which purpose a suitable location has been selected and purchased, and the association, which is a member of the National Chamber, voted to take the matter under consideration.



Dayton Wire Wheel Co., Dayton, O., Had Its Products Effectively Displayed.

Digitized by Google



eth of Victor Manufacturing & Gasket Co., Chicago, Made a Strong Appeal for Business.

The association went on record as fa-ing the adoption of the national bud- system and pledged assistance ough the various channels through ich the desired results can best be ac-plished. The matter of spurious ad-ising, against which a campaign has n waged by the Associated Advertis- clubs of the world, was given due sideration, and the board of govern- was appointed a clearing house for questionable advertising that comes hin the range of this association. The ration of railroads and carrying panies to private ownership was fa-ed.

ne of the most important matters dis-sed was the new constitution and by-s, which was submitted at the last vention at Hot Springs in June. It unanimously voted to adopt the same h the amendments recommended by board of directors.

Next Convention at Del Monte, Cal.

t was voted that the next convention held the first week in June, 1920, at Monte, Cal.

Committees were also appointed under following heads: Credential, press, olutions, membership, finance, federal, de commission, railroad classification, ndardization, good roads and high-ys, labor and state association.

The labor situation, from the point of business man, was set forth in a stir-g address by Walter C. Hecker, vice sident of the Curtis Pneumatic Ma-nery Co., St. Louis, Mo.

ne of the most important steps taken the way of constructive work was the horization of the addition of two field retaries to work under the supervi-of the national field secretary. rge Fritz, who with the commissioner, Webster, will outline the programme e carried out. It is planned to make of such a character as to be of far-hing benefit to the entire trade.

The question of "wholesale only," which received considerable considera-tion at the last meeting, was again de-bated, but no definite action was taken, and the matter was tabled for further discussion at the next meeting in June.

Another matter that was discussed at length, but on which no decisive action was taken, was that of co-operation be-tween jobbers and manufacturers and among the jobbers themselves.

Among the social activities of the week in connection with the meetings of the association was a mock trial and min-strel show put on the evening of the third day in Aryan Grotto Temple, which was enjoyed by over 1200 members and their friends. This was given under the direc-tion of the Chicago Automotive Manu-facturers and was full of up-to-date, mirth-provoking features.

NEW OFFICERS ELECTED.

President—R. R. Engelhart, Sieg Co., Davenport, Ia.
Vice President—Robert A. Stranahan, Champion Spark Plug Co., Toledo, O.
Chairman, Board of Directors—Howard M. Dine, Dine-DeWees Co., Canton, O.

L. A. Cavanaugh, Motor Car Supply Co., Calgary, Conn.
Earl Reynolds, Tacoma, Wash.
R. R. Engelhart, Sieg Co., Davenport, Ia.

Some of the work accomplished by the standardization committee was among the important features of the convention. This committee met on Monday, in accordance with the scheduled programme. Those in attendance were: Chairman,

Multibestos Line Shown by Standard Woven Fabric Co., Walpole, Mass.

Digitized by Google

Full Line of Accessories Exhibited at Headquarters of Fulton Co., Automotive Equipment Manufacturer.

F R. Hall, Ohio; vice chairman, William Von Elm, New York; C. L. Wheeler, Utah; W. B. Dean, Michigan; F. H. Suter, Wisconsin; W. F. Parker, Ohio.

The first matter was the consideration of unfinished business passed along by the preceding committee. It was decided that in order to accomplish the maximum amount of good to the association and its members the standardization committee should formulate an entirely new method of procedure, using as a basic idea the building of a set of standards which would not only be of value to the association of today, but which would lend themselves to expansion and be the basis of future standards which might be adopted from time to time.

With this thought in mind the committee divided itself into two groups, which were to study the various phases of a programme which would fill the needs of the association. It was unanimously voted to submit to the convention recommendation pertaining to the work of the standardization committee and to the issuance of a permanent record book to be known as the "Hand Book" of the Automotive Equipment association.

It was recommended that any member of the association desiring a hearing on a matter of standardization should seek the chairman of the sub-committee under which his question might properly come, and make arrangements that the question be brought up for discussion at the next regular meeting of the sub-committee.

The standardization committee will discuss and act upon all matters of a standardization nature and all standard practise and all recommended practise as handed on to it by sub-committees. All practises voted on favorably by the standardization committee will be passed on to the board of governors for their consideration, and then to the general assembly for their consideration.

All standard practise and all recommended practise adopted by the general assembly will at once be sent out to all members of the association, and said practise will become a part of the hand book of the Automotive Equipment association.

Hand Book Is Outlined.

This hand book will consist of a loose leaf binder which will be furnished the members at cost by the association. Filler sheets will be furnished each member of the association by the association without charge, and will contain information as follows:

List of officers and board of governors.

List of member companies; their delegates and alternates.

List of member companies and their corresponding secretaries.

List of standing committees and their personnel.

List of sub-committees with their chairman, vice chairman and secretary.

A description of the method of operation of all committees.

The constitution of the Automotive Equipment association.

By-laws of the Automotive Equipment association.

Introduction to the book of standard and recommended practise .

List of standard classifications.

Each binder will contain a full set of index sheets showing standard classifications under which the standard practise and the recommended practise sheets shall be filed as a matter of permanent record and information.

Each of the classifications as above enumerated will have a temporary chairman appointed by the standardization committee. It will be the duty of the temporary chairman to organize the members of his sub-committee, and duly elect a permanent chairman, vice chairman and secretary.

LIST OF CLASSIFICATIONS.

It was recommended that the manufacturers now members of the association be classified under the headings as given.

Group

1 Tire accessories, patches, reliners, etc.
2 Non-skid devices.
3 Lamps, bulbs, etc.
4 Ignition, spark plugs, etc.

New Era Spring & Specialty Co. Specialized on Better Springs and Bumpers.

Description of Accessory Exhibits

The general scheme of the exhibits was to have them resemble as much as was possible a small store or office where *business* might be transacted with the same facility as if the exhibitor were in his own factory or jobbing headquarters. The result was that the jobbers and manufacturers got into close contact without any of the distractions prevalent at the ordinary motor car show, and real business resulted. The volume of orders booked far exceeded the most sanguine expectations of the exhibitors. One piston ring maker is reported to have sold more than 2,000,000 rings, and one metal goods specialty man received a single order amounting to $100,000. Another man said that it would have taken months of time and the expenditure of several thousand dollars to have gotten into touch with the prospects that voluntarily walked into his booth.

One of the primary objects of the exhibit was to permit the jobbers to get information for catalogues so they can be issued in January. Heretofore it has not been possible to compile catalogues until the jobbers have had a chance to see the lines offered by manufacturers at the New York and Chicago shows.

Walden-Worcester, Inc., had a very prominent position for its display of steel socket wrenches, and a full line was shown. The trade was greeted by L. H. Bellows, general manager; Charles A. Shedd, chief engineer; F. W. Bellows, sales manager, and L. H. Craig, Chicago; L. A. Raasch, San Francisco, and H. H. Stewart, New York. This company held a sales convention during the week which all of its salesmen attended.

As one entered the main entrance and turned to the right, the first exhibit was that of the Lockwood-Ash Motor Co., Jackson, Mich., with a display of its well-known Sterling spark plugs. A. L. Lockwood gave personal attention to all callers.

The exhibit of the Motor Specialties Co., Waltham, Mass., was in charge of George W. Boynton. A complete line of electrical fittings, switches, dash lamps, trouble lamps, valve grinders and other accessories was shown and the various products were nicely displayed.

D. R. Wallis had charge of the exhibit of the Splitdorf Electrical Co., Newark, N. J. This was a very attractive display and included a full line of Green Jacket spark plugs, electrical measuring instruments, ignition cable, magnetos, piston rings and the Master electrical primer. There were also a large number of dealers' helps shown in handsome cases, which were carefully studied by the trade.

A crowd could always be found at the booth of the Perkins-Campbell Co., Cincinnati, O., the well known manufacturer of seat covers, rain shields, tire covers, radiator and engine covers. M. Campbell, with several assistants, gave a hearty welcome to all visitors.

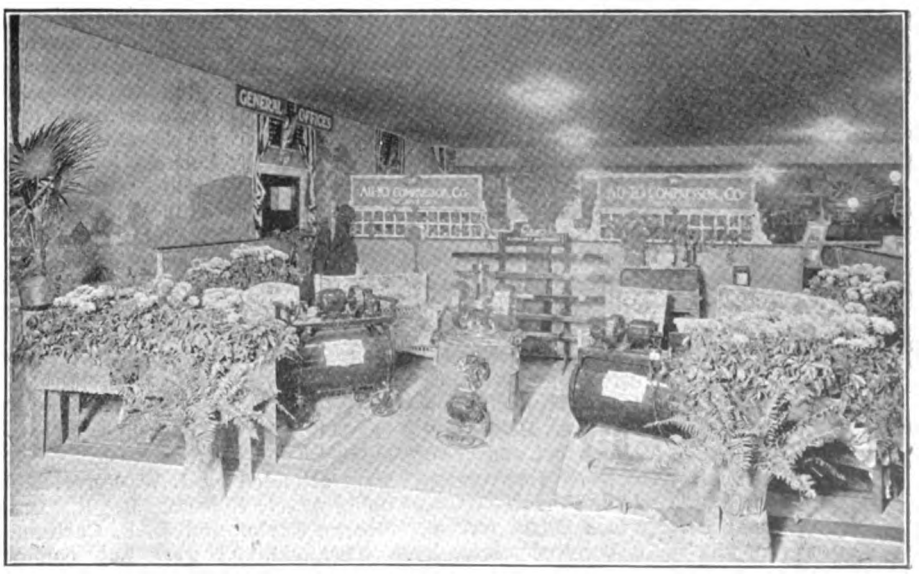
Gray & Davis, Inc., Boston, displayed a full line, special attention being given to the Ford starting, lighting and ignition system, which is stated to be composed of the same units as are used on high priced cars except for the difference in the matter of application. E. F. Wackweitz was in charge of the exhibit.

Smalley Daniels of the New Era Spring and Specialty Co., Grand Rapids, Mich., was busy greeting his legion of friends in the trade. A great interest was shown in the large display of "Better" spring bumpers, tire carriers and springs manufactured by this company. Mr. Daniels had the pleasure of introducing the trade to his son George, who will hereafter be connected with the company.

One of the most attractive booths at the show was that of the Au-To Compressor Co., Wilmington, O. Its line of air compressors for garages, connecting rods for Fords, together with the Oro combination wrench for spark plug and cylinder head bolts was very attractively displayed amid growing flowers in blossom. Big easy chairs were provided for the comfort of visitors, and the services of a stenographer were tendered. A. H. Kilburn was in charge of the booth.

The Northwestern Chemical Co. exhibited its entire line, making up a novel and interesting display. A Ford car was placed in the booth and from different parts of the car a ribbon was strung to cards showing how various repairs had been made by the use of the company's products. F. R. Hall was in charge. Following the show a meeting of all sales representatives was held at the plant at Marietta, O.

The Gardner Governor Co., Quincy, Ill., staged a complete exhibition of the eight models of air compressors manufactured for the garage trade. The booth was located just at the left of the entrance of the building and was one of the first to meet the eye. One of the features was the new two-stage type air compressor designed to give service without a fault. The following were in attendance: R. G. Gardner, C. A. Dickerson, L. R. Bremser, G. A. Wall, R. B. Sinnock and Walter B. Johnson.



Full Line of Au-To Compressor Co. Shown Embowered in Blossoming Plants.

Digitized by Google

The Edgar C. Guthard Co., Chicago, had a main floor booth set in the path of the visitors in reaching the main exhibition room in the basement. The display clearly demonstrated the efficiency of the Master wrench. E. C. Guthard and Dan Cherrier of Chicago did the honors for visitors from their section. J. H. Cooper and H. E. Witherspoon to those from the East. Paul Barnard received those from the northwest and R. S. Longstaff from the Pacific coast.

Sioux Valve Grinding Tools.

Albertson & Co., Sioux City, Ia., was present with a complete line of Sioux valve grinding tools, so displayed that at a glance it was easy to see why the Sioux products are regarded as among those which have come to stay. The company was represented by O. Albertson, B. B. Weldon and C. H. Harper. Several additions to the Sioux line will soon be announced.

The Challoner Co., Oshkosh, Wis., presented a fine line of traction equipment. There is not a wheel made, it is said, that cannot be fitted with traction chains from the Challoner line. Among the company's experts in attendance were H. Osgood, Otto Kaufman, Carl Kennuman, R. Church, W. E. Clark and William H. Krug.

The Stiles-Gilliland Manufacturing Co., St. Louis, Mo., certainly covered its products in a manner worth noticing. The explosion whistle attracted a great deal of attention, as did also the practical fender straightener. The Liberty siren proved worthy of its name. J. Stiles, Samuel Braden and E. S. Carmack were kept busy booking orders.

Bumpers and Ford Specialties.

The Gemco Manufacturing Co., Milwaukee., Wis., displayed a full line of bumpers and Ford specialties. The booth was attended by G. H. Traveranus, H. A. Taylor, A. H. Tank, A. A. Lightfoot and F. N. Kentzinger.

While the booth of the Anderson Co., South Bend., Ind., was a little out of the way of the main traveled route, it was by no means overlooked. The Anco even heat manifold for Ford cars is well enough known to attract the attention of all who ever heard of a manifold, and the Anco timer and Anco double-duty ball thrust bearing were not at all slighted. The salient features were explained by A. B. Keasey, C. H. Wollcott, O. B. Zwietusch and B. C. Bremer.

The Van Cleef Brothers, Chicago, had its wares right in the heart of things. Over 100 different products of this concern were shown, which have become widely known. An attractive feature was the Van Cleef Dutch girl, so well known to automobile owner and trade, who was there in the life, wooden shoes and all. The representatives in charge included Felix Van Cleef, Maxime Van Cleef, Paul Acton, E. H. Meyers, R. M. Pardillo, Noah Van Cleef, Paul Van Cleef.

The Advance Felt Specialty and Cutting Co., Chicago, was represented in no uncertain manner. This line of felt, paper and leather gaskets is recognized as being in the fore front of such equipment. Orders were taken by J. F. Berthold and R. V. Hughes.

Attractive Dutch Girl Graced Well-Arranged Display of Van Cleef Brothers.

The Mayo-Skinner Manufacturing Co., Chicago, presented in a convincing manner, its line of air compressors, tire pumps, grease guns and garage equipment. The booth was in charge of Franklin Mayo, Howard Weakley, A. F. Cannon and T. F. Burns.

The Weaver Manufacturing Co., Springfield, Ill., made a fine display of garage equipment. With such a well known product no detailed description is necessary. The Weaver sales force, C. F. Hodgson, I. A. Weaver, Ralph Waldt, "Weaver" Jack Whaley, G. F. Coad and A. B. Crawford, were up to their eyes with business.

The H. W. Johns-Manville Co., New York, had a very extensive exhibit of band linings, speedometers, fire extinguishers and other accessories. Visitors were attended by J. W. Perry, E. E. Arnold, A. N. Slocum, R. R. Draggins, George Saylor and L. F. Carlton.

That exhibits were not confined to manufacturers in the northern states was manifested by the fact that the Interstate Electric Co, New Orleans, La., had on display its line of Steer Warm steering wheels, which if used on a Ford are heated from the magneto and on other cars from the battery. The business was booked by P. Stern, S. B. Corby and Charles F. Rhodes.

To see a full line of radiators, fenders and tool boxes for Ford cars, visitors had only to stop at the booth of the Corcoran Manufacturing Co., Cincinnati, O., where either W. R. Hughes, B. C. Pittenger or Martin Murray was pleased to show these accessories.

The Macbeth Lenses.

The Macbeth-Evans Glass Co., Pittsburgh, Pa., had a beautiful display of the Macbeth lenses. H. Parker and J. C. Chapline were glad to show the practical advantages of the Macbeth lamps with which the booth was equipped. Dealers' helps were also given a prominent place.

The booth of the Double Fabric Tire Co., Auburn, Ind., was in charge of F. D. Higgins, C. L. Stebbins and S. G. Biddle, who were pleased to show that company's line of tire accessories, including reliners, inside patches and Interlock inner tires. They report a good business.

At the booth of the Hawthorne Co. Bridgeport, Conn., the advantages of the Old Sol spot light were explained by Horace Hawthorne. This is well said to be the spot light that suits every purpose and every pocket book. This is also one of the companies that takes particular care of the dealer by furnishing dealers' helps. One of these was shown at the booth, consisting of the figure of a man on a standard pointing to an Old Sol spot light, and looked like a winner for either a counter or window display.

Air Principle Carburetion.

The Van Briggle Motor Device Co., Indianapolis, Ind., showed the air principle carburetors for Ford, Dodge and Maxwell cars, as well as shock absorbers for Ford cars and light delivery trucks. Here was also seen for the first time the Van Briggle shock absorber for Ford trucks. F. Moore, A. A. Dunlap, C. A. Taylor, A. Van Briggle, F. P. Wright, R. C. Hackett and C. G. Foswell were the salesmen in charge.

The one idea exemplified in the booth of the Brunner Manufacturing Co., Utica, N. Y., was comfort. In the center a handsome rug covered the floor. The furniture was rich willow, including easy chairs, lounges, etc., and while the visitors were enjoying a rest the company's line of air compressors was explained by T. L. Brunner, J. H. Meaham, A. B. Jenkins and A. F. Atherton. Here was made the first showing of the Brunner model No. 742 belted motor driven air compressor and the new 45 air cooled motor driven compressor, which has a capacity of five cubic feet and is especially designed for pneumatic truck tire inflation. Business was very brisk here throughout the show.

Complete Line of Accessories.

The Apco Manufacturing Co., Providence, R. I., showed at its booth a complete line of Ford accessories in which this company specializes, together with representative exhibits of the large st

Digitized by Google

of general automotive supplies carried by this concern. The display was in charge of F. F. Wilson, C. H. McKeean, James D. McCauley, J. B. Wilson, G. A. Ashton and John Colley. By the throng constantly in line here it could be judged that many orders were being taken.

Special mention should be made of the splendid exhibit of the Frank Mossberg Co., Attleboro, Mass., which was in charge of Frank T. Chase and E. W. Scott. This company had on display a full line of wrenches and other tools, and the attention of the trade was especially drawn to the Mossberg speed socket wrench with heavy duty drawn steel socket. The showing also included a garage tool cabinet equipped with wrenches to fit every nut and screw on all passenger cars.

Rusco Transmissions.

The Russell Manufacturing Co., Middletown, Conn., manufacturers of the Rusco line of transmissions, brake linings and fan belts for Ford cars, was shown in an attractive booth in charge of M. J. Miley.

The Marvel Accessories Manufacturing Co., Cleveland, O., makers of steam vulcanizers, tail signal lights, valve grinders, windshield cleaners and tire chain tools, displayed its products in a beautiful electrically lighted display case. S. I. Rose was present to take orders for this line.

The National Standard Co., Niles, Mich., represented by R. W. Smith, displayed its line of Standard auto jacks, including a special jack for trucks having ball bearing features.

The Atwater Kent Manufacturing Co., Philadelphia, had a very tastefully decorated booth in which the trade was greeted by V. W. Collamore, W. J. Wheatly and S. A. McKenney. Among the features was the new Ford double unit, six-volt starting and lighting system, with Bendix drive and compound wound third brush generator for 1919-1920 Ford touring cars and roadsters, and the new type A. C. ignition system for all 1919-1920 Ford cars. This A. C. system is stated to be identical with that used as standard equipment on many foremost cars.

The Coe-Stapley Manufacturing Corporation, Bridgeport, Conn., had a very interesting exhibit of tire pumps, bicycle pumps, grease and oil guns, jacks and oil cups manufactured by this company. The representatives were George O'Donnell, president of the company; George C. John, C. L. Cagney and G. R. C. Cotten.

Brake and Clutch Linings.

The Standard Woven Fabric Co., Walpole, Mass., showed its complete line of brake and clutch linings. These were arranged in a manner so as to make a very attractive booth, and from the number of visitors it was evident that H. F. Collins, the Chicago manager, who was in charge, was doing business. The exhibit included a novel dealers' help in the form of an automatic policeman calling attention to the advertising slogans of the company, "Stop on Multibestos," and "Start on Multibestos," which is to be used in connection with window displays.

The Arrow Grip Manufacturing Co., Glens Falls, N. Y., had on display its Arrow grip traction and skid chain, also the Arrow grip roller base jack. E. G. Martin was kept busy showing these products.

The Auto Metal Parts Co., Des Moines, Ia., displayed a part of its line of radiator shutters. The exhibit attracted considerable attention and many good sized orders were said to have been booked. The shutters shown were adapted for Saxon, Nash, Ford and Maxwell cars. Those in charge were T. A. Messenger and J. E. Messenger.

The Inland Machine Works, St. Louis, Mo., had on view a full line of Inland piston rings. A representative list of salesmen were present, consisting of F. C. Bauer, L. T. Breck, A. Koenig, J. C. Clifford, R. C. Greenwall and W. R. Lick.

The booth of the Sinclair Refining Co. was located at the corner of the main exhibit room, where it could not be missed. The well known line of Sinclair oil products was shown, the points in favor of which were pointed out by W. L. Osborne, staff engineer, and George T. Briggs, manager.

Novel Feature of Northwestern Chemical Co.'s Booth, Showing How Repairs Are Made on Ford Car.

Shaler Line of Vulcanizers.

The C. A. Shaler Co., Waupun, Wis., had on display the entire Shaler line of vulcanizers. Practical talks to the repair man were the order of the day here if needed and every effort was made to demonstrate that the Shaler line fitted in with every condition to be met with. The booth was attended by five representatives, as follows: R. M. Dunlap, R. E. Malone, F. O. True, W. K. Melcher and E. B. Carroll.

The Howe Lamp and Manufacturing Co., Chicago, showed a representative line of spot lamps and the new Howe Ford timer was featured. This display was in the hands of Bert G. Cochrane, "Happy" Rhodes, Norman Cowan, Ray Cavanaugh, Joseph St. Mars, W. L. Hirsig and Charles Faucette.

At the booth of the B & W Manufacturing Co., Chicago, a complete line of radiators was exhibited, including such models as the Ford, Dodge, Maxwell, Chevrolet, etc. President S. D. Briggs and Sales Engineer R. H. Cory of the company were in attendance.

The Metal Specialties Manufacturing Co., Chicago, displayed its complete line of electrical supplies for the car, including switches, plugs, electric connections and electric cigar lighters. The booth was in charge of L. M. Golder, N. H. Oliver, Ben Steinberg and L. M. Clifford.

The Atlas Specialty Manufacturing Co., Chicago, had on display a full line of fabric goods such as radiator covers, tool bags, etc. Those in charge were C. J. Wallheim, W. Graham and W. C. Mueller.

The Curtis Pneumatic Machinery Co., St. Louis, Mo., was busy demonstrating the Curtis air compressor. Two new models were seen at this show for the first time at any exhibition. These were the trade style V, which is belted or geared, and the style Y, a small portable ¼ horsepower outfit especially designed for private garages or small public stations. L. C. Blake was in charge.

Titan Spark Plug.

At the booth of the Champion Ignition Co., Flint, Mich., W. S. Isherwood, sales manager, and a corps of assistants were kept busy telling about the merits of the A. C. Titan spark plug. This booth had an attraction for jobbers from all sections.

E. Edelmann & Co., Chicago, had a display that needed no outside advertising to attract attention to it, and the products on exhibition were a real invitation to the buyer. The popularity of the Han-D line of automobile tools was undisputed. Those in charge were E. Edelmann, B. Koral, M. Levit, H. R. Andariese and P. E. J. Palmer.

Exhibitors Are Enthusiastic Over Success

Prominent Accessory Makers Comment on Benefits Derived from Accessory Show and Demand Continuance of Exhibit Feature.

The Get-Together Spirit.

This show has been a revelation to me and I can truthfully say that I had never expected to witness an event so productive of those things for which a show of this character is intended. It is really wonderful.

We are so in the habit of regarding a trade show as a conglomeration of things and attended by so many with conflicting interests that we expect only to be able to display our line and perhaps get enough business to cover our expenses, together with the uncertain publicity value. You can see for yourself by this bunch of orders the quantity of goods we have actually sold.

Comfort Was the Idea Exemplified at the Luxurious Headquarters of the Brunner Manufacturing Co.

The success of this exhibition is founded on a thorough understanding as to the requirements of the automotive equipment industry.

This is the time of the year the jobber or dealer is sitting back and regarding next year's business. In the past he has been forced to get his view through the eyes of the manufacturer's catalogue or the salesmen who called on him. He never had a chance to decide his questions or select his lines entirely free from the worries of other matters. Here he has found a complete display of not one line, but of several, and is free to make his choice of the one best suited to his needs.

From the jobber's standpoint he is able to get in contact with men who can best give him ideas as to his future policies, and at a time when he wants to get together facts and figures. His next year's catalogue is staring him in the face and through this show he is able to get items and information in proper order and material with which to prepare his catalogue in a clear and concise manner.

There are hundreds of reasons why this show is a success, but to my way of thinking the most important is that we are all here with the right kind of a get-together spirit and can talk business in a businesslike manner with no outside influence to interfere with our better judgment.

Never has the industry known such a gathering of those strictly in the trade. The register will show every state in the Union represented. The attendance is far beyond the expectations of everyone concerned.

O. P. HAND, President.

Burd High Compression Ring Co., Rockford, Ill.

Created an Enormous Interest.

In my opinion this Automotive Equipment association show has created an enormous interest on the part of the jobbing houses of the country, as is evidenced by the fact that all jobbing houses are represented here by their purchasing agents, who carry their order books with them. This shows that they visited the show intending to place orders. The fact that the show is held in early November is a great benefit not only to the jobber, but to the dealer and autoist as well, as they are fully advised of the new lines and improvements before the touring season begins.

Manufacturers have certainly found a new interest in shows of this kind because 100 per cent. of the attendance is of those actually interested in accessories. Past experiences of attempting to satisfy catalogue hunters and souvenir seekers is avoided. There is no reason why a similar show each season should not become a permanent feature of the industry.

J. H. COOPER,
Edgar C. Guthard Co., Chicago.

An Overwhelming Success.

I think the show is a great success, in fact an overwhelming success. It has brought the manufacturer in touch with the jobber and dealer at the season when they are thinking of buying.

The accessory business today is so large that it should be handled in an independent way rather than in connection with the automobile show. At this show we have been able to meet the trade from all sections of the country, and all are very optimistic as to future business.

A. H. KILBURN,
Au-To Compressor Co., Wilmington, O.

One Hundred Per Cent. Good.

The best way to express the result and benefits of this exhibit is that it i 100 per cent. good any way you look a it. Never since the beginning of the au tomobile industry, and I have attende prominent shows, have the manufactu er, jobber and dealer been able to get s close together as at this exhibit. No sid attractions to interfere. Nothing bu business, business, business. I can sa without fear of contradiction that t showing of automobile accessories h been so successful as the present on Every manufacturer who is showing h line here has met jobbers and deale from all over the country, who can with the express purpose of buying. I e pect to see the future exhibits held connection with the Automotive Equ ment association meetings much larg than the present one.

SMALLEY DANIELS, Pa
New Era Spring and Specialty Co., Gra Rapids, Mich.

Digitized by Google

Exhibition Most Successful.

This exhibition was beyond question the most successful ever organized by manufacturers of automotive equipment. The attendance included jobbers and dealers from all sections of the country. It was particularly noticeable for the attendance not only of principals, but their buyers and catalogue men. A real business show at the proper time of the year to enable the jobber to collect information and decide on his line for 1920. Every person attending was extremely enthusiastic about the show and optimistic regarding 1920 business.

The show is bound to become a permanent feature and the 1920 exhibit will be larger and better.

W. S. BELLOWS,
General Manager Walden-Worcester, Inc., Worcester, Mass.

A Business Show for Business Men.

I consider this show to be a business show for business men. The accessory business has gotten to the point where it is one of the big businesses of the country and, while allied with the car industry, has grown to such proportions that there is no more necessity for an accessory manufacturer to show at an automobile show than for a hardware jobber to do so except that an exhibit at the regular auto shows is perhaps good advertising. This show has cemented the business relations of the jobber and manufacturer as nothing has ever done before.

S. L. ROSE,
Marvel Accessories Co., Cleveland, O.

Unison of Purpose the Watchword.

The reasons why the first annual exhibit of the Automotive Equipment association is a success can be stated in few words. We are all here. We all know why we are here. We intend to do those things for which we are here. These things in combination with the fact that all concerned are left free from the excitement attending other interests not concerned with their particular business are what make this show a complete show from every standpoint.

I was walking around today looking at the various badges worn by the men in this room. Every part of the country was represented by at least one man. The East and West, the North and the South met with but one idea. Carrying on business as a unit was the watchword and when you come down to facts you can't beat the positive unison of purpose as evidenced at this gathering.

Buyers and sellers, makers and distributors, are meeting one another face to face and finding that each has his own troubles and in meeting, the result is found to be beneficial to every one of us.

Jobbers are finding that retailers are anxious to establish firmer relations with them and manufacturers are learning that the jobber is struggling for the same ideals that he thought he was the only one that cared a darn about.

The result of this exhibition will be the greatest development seen in years and I predict that other industries will take a page from the history of this affair to guide them in their future meetings.

This show is already a success. It was bound to be. Watch next year and you will see this event will be at least twice the size of this show and the attendance will surely be several times as great.

You ask why is this exhibition a success. I ask you, in return, how could it help but be? Every purpose of such an occasion is certainly met.

G. L. BRUNNER,
Brunner Manufacturing Co., Utica, N. Y.

An Ideal Exhibit.

Keeping pace with the 20th century idea of better methods and economical merchandising ideas, the accessory exhibit held by the Automotive Equipment association in Chicago the week of Nov. 3 has thoroughly demonstrated its superiority over anything so far presented to fill this bill.

It is my honest belief that it is the right method, according to all methods, up to the present time, that have been put before the automobile accessory trade of the world.

First—The exhibits were instructive and made for business pure and simple.

Second—They were attended only by people actually interested, leaving out sight seers and souvenir hunters.

Third—It was possible for jobbers to obtain all ideas for the following year's business, as the exhibit was instructive and came just before the new catalogues were to be compiled and printed.

Fourth—The attendance was by heads of firms, their buyers and purchasing agents and their sales managers.

Fifth—The economical way for a manufacturer to place his goods before the jobbing trade, for with one exhibit and one expense, the whole trade could be instructed. This also applied to the jobbers.

Summing this all up, from expressions received from numbers who were consulted, this exhibit was a great success from the start to the finish. It was a show that we have all been looking forward to. The results produced simply depended upon the individual manufacturer and the comparative merits of his products and sales policy.

S. W. HANNA,
Columbus Varnish Co., Columbus, O.

Strictly for Business.

In my opinion, the first business show of the Automotive Equipment association was a huge success. There were few, if any persons in the big crowd attending the show who were not there strictly for business. Every jobber present seemed intent on making the most of the opportunity to get acquainted with the various manufacturers and the goods.

Certainly we have no cause to complain. The Victor Co. closed enough actual business to pay for the time and trouble of arranging the exhibit many times over. I believe many accessory manufacturers who were not represented this year realize that they made a mistake and that the show next year will be even more of a success.

A. C. DELSON,
Sales and Advertising Manager, Victor Manufacturing and Gasket Co., Chicago.

Attractive Booth of Motor Specialties Co., Waltham, Mass., at Automotive Equipment Exhibit at Chicago, Ill.

Biggest Thing in Automotive Industry.

If I started to tell you of all the good things I could say about the A. E. A. show in Chicago, it would fill a good sized book, but I will say that from every standpoint it is the most successful show that I have ever attended and the A. E. A. should be given credit for putting over the biggest thing in the automotive industry.

THOMAS F. WILSON,
President Apco Manufacturing Co., Providence, R. I.

Some Opinions as to Trade Prospects for Season of 1920

The outlook for 1920 is exceedingly bright. Manufacturers are placing heavy specifications for the 1920 season, and the demand for all styles and sizes of automobile cables is increasing. We are running full capacity at the present time, and are planning to increase our present facilities in order to take care of the further demand for 1920, which we feel that we can reasonably expect during the early months of next year.

On the whole we believe that 1920 will be a banner year for the automobile industry in general, provided there is no serious tie-up in raw material.

N. A. WOLCOTT,
President Packard Electric Co., Warren, O.

WILLIAM M. WEBSTER.
Commissioner of the Automotive Equipment Association.

Outlook Is Excellent.

We are pleased to advise that our company started to market one item in 1915. We adopted a policy of advertising in the leading trade publications and sales to be handled through jobbers. We have since then added four items to our line, and we are now selling more than 500 jobbers in the United States, Canada and 23 foreign countries.

Basing our opinion on requests for catalogue matter and electrotypes from the jobbing trade we know that the year 1920 will be the greatest year in the history of our business. And we have based our contracts for raw material accordingly.

While there is a great deal of unrest at this time owing to labor conditions and which to a certain extent have hampered out production, we believe that the true American spirit will prevail, and that radicalism in both labor and capital circles will be crushed and that there will be a more thorough understanding by these two factors which enter into our unparalled prosperity.

J. F. SHUFORD,
President Shurnuff Manufacturing Co., St. Louis, Mo.

Glimpse of Booth of the Columbus Varnish Co.

Preparing for Enormous Business.

We wish to state that we are preparing for an enormous business in 1920. After having a great deal of trouble obtaining material for seat covers we found it necessary to purchase very large quantities to be able to get the patterns that we desired. For some time we hesitated about purchasing these enormous quantities, but after going over the field very carefully to see what the prospects were for 1920, we decided that we would not only purchase the amount of material that the mills wanted us to buy, but we doubled that amount.

Many people have figured that the automobile concerns would catch up on production along about the first of January, not figuring, however, the increased demand, and this company believes that the panics and a great many things of this kind that the people are predicting are entirely in the minds of the people without investigating to see what the real conditions are. Regardless of the so-called labor unrest and the fact that many statesmen are predicting panics on account of the extravagance of the people, business continues good and will continue good, and it is through the so-called extravagance of the people that these times of prosperity will continue.

The idea that history will repeat itself and panics will follow the war as in the past, does not in the least frighten this company in regard to the season of 1920 or even 1921. We are preparing for a very large business and believe that it will be here.

M. D. CAMPBELL, Sales Manager.
Perkins-Campbell Co., Cincinnati, O.

COMMITTEE OF ARRANGEMENTS.

William M. Webster, Commissioner, Automotive Equipment Association.

Chairman, L. P. Halladay, L. P. Halladay Co., Streator, Ill.

W. K. Norris, President, McQuay-Norris Co., St. Louis, Mo.

George L. Brunner, President, Brunner Manufacturing Co., Utica, N. Y.

F. B. Caswell, Sales Manager, Champion Spark Plug Co., Toledo, O.

R. R. Engelhart, President, Sieg Co., Davenport, Ia.

Anticipate Big Trade.

We anticipate a very large volume of trade for 1920. We have improved our models and also created some new designs and our trade is more favorable to our line of production than ever before inasmuch as we have given our jobbers every protection and also conduct a very efficient service department to take care of all repairs and parts for our lamps required by our jobbers.

HORACE HAWTHORNE,
The Hawthorne Co., Bridgeport, Conn.

Brief Comments on Annual Equipment Show

Beyond my fondest hopes.—Von Elm, E. A. Laboratories.

A huge success.—Perry, Johns-Manville Co.

Keep me space for next year.—Shuford, Shurnuff Manufacturing Co.

Never thought it could be done so successfully.—Sacks, Pennsylvania Piston Ring Co.

A success beyond expression.—Safford, McQuay-Norris Manufacturing Co.

Never did so much business at a show.—Harlem, Judd & Leland Manufacturing Co.

Success don't half express it.—Wissler, Herring Motor Co.

Put me down for space three times as large for next year.—Koral, Edelmann & Co.

A long felt want in the accessory and equipment line—we are highly gratified.—Caswell, Champion Spark Plug Co.

I'll never miss one of these shows—but more space next time please.—Carlisle, Atwater Kent Manufacturing Co.

Pleased? Yes, indeed, and I was one of those on the stage.—Patterson, Warner-Patterson Co.

It seems like a dream—I'm afraid I'll wake up; pleased? Yes, highly satisfied.—Crabill, Central Brass & Fixture Co.

The Canadian manufacturers who are not here are surely missing it.—MacWilliam, Hyslop Bros.

A great credit to this association.—J. Ernest Millen, John Millen & Son.

If I had not been here to see it I could never have believed it.—Walter Chanslor, Chanslor & Lyon Co.

This will go down in history as one of the best shows and the grandest success ever.—McGauley, Peters & Herron Co.

This will make the association stand out like the Rock of Gibraltar.—Auger, McCoy Motor Supply Co.

This should be an incentive for every jobber and manufacturer worth while to get into this association.—Weinstock, Weinstock-Nichols Co.

A splendid success—perfectly wonderful.—Bloch, Gibson Co.

A good show, well staged, good attendance and what's better, results.—Campbell, Perkins-Campbell Co.

I wouldn't have missed it for anything.—Hennecke, Moto-Meter Co.

We gave up half of our space and at that did twice as much business as we expected.—Heineke, Halladay Co.

I don't know to whom the credit is due, but it is due somebody, for it was the finest from every point of view and we are pleased beyond expression.—Isherwood, Champion Ignition Co.

A success? Well I would say so—just leave it to this grand association to do things.—Low, Electric Appliance Co.

I am highly pleased as I believe every one else is.—Oliver, Metal Specialists Manufacturing Co.

Both as a manufacturer and a jobber, I can say the best ever.—Stern, Interstate Electric Co.

Everyone should feel proud of it—I know we Canadians do.—Hopkins, Canadian Fairbanks Co.

The manufacturer that is not in this show surely misses it.—Smith, Pennsylvania R. & S. Co.

More space and bigger quarters next time, please.—Sutherland, Splitdorf Electric Co.

Almost beyond human conception.—Reinhard, Reinhard Bros.

If there was anything left undone it will be cared for in the next—but it was a howling success from every angle.—Wright, Ballou & Wright.

Did more business than at any other show.—Knight, J. & B. Manufacturing Co.

At that the jobber knows how to buy and when to issue his catalogue.—Suter, Shadbolt & Boyd Iron Co.

A money and time saver and an educational event.—Ramey, American Ever-ready Works.

The biggest and best ever staged.—Bouthinon, Spencer Metal Products Co.

Have never heard so much satisfaction expressed before.—Hodgson, Weaver Manufacturing Co.

Now for more space and a larger hall.—Fulton, Fulton Co.

To use talking, it went over big.—Stiles, Stiles, Gilliland Manufacturing Co.

We are more than satisfied.—Laidlaw, Dayton Wire Wheel Co.

The whole crowd was just feeding up on enthusiasm all the time.—Chase, Frank Mossberg Co.

When the history of this association is written, this show will stand out most eminently as one of its greatest achievements.—Jackson, Jackson Motor S. Co.

ADVANCE IN CRUDE OIL.

An increase of 25 cents a barrel in the price of Mid-Continent and Texas crude oil has just become effective, bringing the price up to $2.50 a barrel, the highest price that has ever been recorded for this product. There was recently announced a rise in the price of Pennsylvania crude, but this is the first advance in Mid-West and Texas for more than a year.

It has been realized in the oil industry for some time that the production of high grade oils was far below the demand, and there have been frequent rumors that the price would be advanced in all the producing areas. Estimates place the increase in production at 1,000,000 barrels a month, while the foreign and domestic demand is racing forward at the rate of about 4,000,000 barrels monthly.

During the war the price was kept down by strict government regulation, but now the law of supply and demand is having full sway. One factor in the advance is said to be the increased cost of drilling wells, which is estimated to have been some 50 per cent. during the year, but in that time, until very recently, the price of the oil had not advanced.

It was pointed out recently by an oil man that gasoline was one of the few commodities which had not increased in price.

BIGGEST LONDON SHOW

WITH more than 200 makes of automobiles exhibited, the 13th annual automobile show at the Olympia in London proved the biggest ever held there. Automobile representatives from all parts of the world attended. Few freak machines were shown. The exhibits included vertical fours, sixes and eights; water and air cooled horizontals and two-cylindered liliputian replicas of the monster aerial statics.

The turning of several former ammunition plants into automobile factories resulted in many new cars. As twice as many applicants desired space as could be accommodated, it was decided to hold the show in two separate sections, so that all could display their products.

The chief exhibits included the Crossley, Austin, Belsize, Douglas, Daimler, Rover, Rolls-Royce, Standard, Singer, Sunbeam, Star, Vauxhall and Napier.

The lowest priced car shown was a two-cylindered machine selling for $575. The Napier was higher priced than any before offered by a British firm, the chassis price being $7280. The 50 horsepower Rolls-Royce chassis was priced at $6552. A 10 horsepower Enfield selling at $1500 was exhibited.

NEW FACTORY FOR TIMERS.

What is believed to be one of the largest buildings in the country devoted exclusively to the manufacture of timers for Ford cars has just been erected at Sandwich, Mass., by the McCulloch Manufacturing Co. This new plant is located on the Cape Cod canal, and has a floor space of over 15,000 square feet. The McCulloch timer is practically a new product in the tire accessory field, having been originally housed at 216 High street, Boston. These quarters soon became too small and the building at Sandwich was planned.

The executive offices of the company will be located in Boston where, in charge of A. P. McCulloch, president and general manager, other McCulloch products will be made. The Sandwich plant, which will devote itself exclusively to the Ford timer, will be under the supervision of W. L. Ross, vice president.

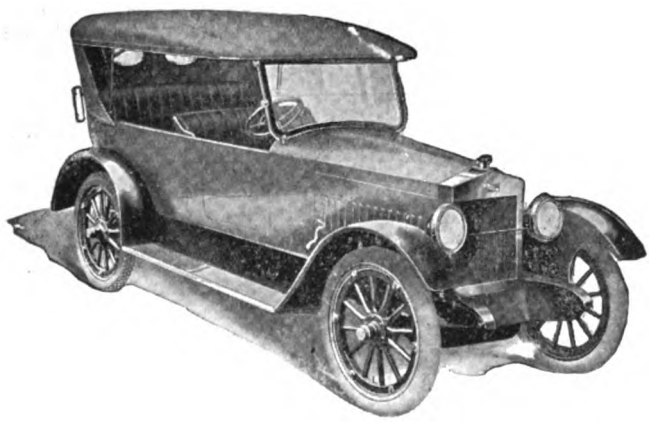
The McCulloch Manufacturing Co. specializes in Ford ignition, and in addition to the timer is making the McCulloch timer grinder and wipe contact.

PACKARD'S QUARTERLY DIVIDEND.

The Packard Motor Co., Detroit, has declared its regular quarterly dividend of 1¾ per cent. on the preferred stock, payable Dec. 15.

Digitized by Google

TO ATTEMPT to satisfy the local and domestic market is a problem that constantly faces the motor vehicle manufacturer and one that necessitates constant study of all phases of the situation. How much more difficult then is the situation which faces the American manufacturer of a car which he expects to market and have operate with satisfaction in foreign countries. Then there is to be considered not only the choice of the foreign buyer in the matters of general design and color scheme, but the various operating conditions to be met with, the rules of the road requiring in general the control of the car from the opposite side to that common in America, road clearances, the grade of gasoline possible to secure, the type and design of parts that will give the utmost service in the hands of the average foreign user,



The New Alsace Export Car.

his ability to get parts and renewals, the sort of top material that will withstand alike the rains of the gold coast and the tropic sun of the Sahara, and the matter of designing the car for easy and safe shipment in the smallest possible number of cubic feet.

This problem of the export automobile has been approached by the Automotive Products Corporation, New York, with a complete understanding of the many problems involved and a thorough grasp of American manufacturing methods and processes and the possibilities of achievement in design and equipment, and it now announces the Alsace, a car produced exclusively for export sale. It has collaborated in the design and controls the entire production of this vehicle, which is built entirely from standard American parts, readily obtainable at all major distributing points throughout the globe, and in its ensemble presents a design which is pleasing to the critical foreign buyer and will render long and efficient service whether on the boulevards of Paris or the veldts of the Transvaal.

This car is to be sold only through large and well established foreign distributors at strategic trade centers, and the fact that advance orders have already been booked for several hundred cars even before the appearance of the descriptive literature, indicates the confidence placed in the organization and equipment of the Automotive Products Corporation, which is an allied corporation of the well known American Steel Export Co.

The brief specifications of the Alsace car follow: Motor, Herschell-Spillman, four-cylinder, 3½ by five inch; lubrication, force feed and splash; cooling, thermo syphon; radiator, honeycomb, large area, Rolls-Royce type, nickel silver shell; clutch, Borg & Beck; carburetor, Zenith; transmission, Grant-Lees, selective, three-speed; starting and lighting, Dyneto two-unit; ignition, Bosch magneto, water proof; battery, Philadelphia Diamond Grid six volts, 120 amperes; drive, Hotchkiss; axle, front, Standard Parts, I-beam; rear, Standard Parts full floating; brakes, service and emergency, each 14 by two-inch; wheels, wood artillery type; frame, five-inch, pressed steel; springs, semi-elliptic, front and rear; fenders, 10-inch, full crown; steering, Gemmer irreversible, right side drive; fuel system, Stewart vacuum; windshield, slanting and adjustable; wheelbase, 116 inches; tread, 56 inches; tires, 32 by four-inch, non-skid rear, plain front, Fisk or Goodrich; body, five-passenger, straight line, one-man top, best leatheroid upholstery; finish, radiator shell, nickel silver, fenders, splash pans and shields, black enamel, body, Rolls-Royce blue, deep red or cobalt blue; weight, 2600 pounds; price, $1485 list, f. o. b. factory, Philadelphia.

Calcutta, India, has more motor cars on its streets than any other kind of vehicle.

TRADE OPPORTUNITIES.

31,143—A commercial agent in France desires to secure an agency for the sale of sewing machines, bicycles, automobiles and bicycle supplies, tires, etc. Correspondence should be in French.

31,277—A firm in Spain desires to purchase and secure an agency for the sale of automobile accessories. Correspondence should be in Spanish. References.

31,279—The partner of a firm in Uruguay will shortly arrive in the United States and desires to secure agencies for the sale of textiles, industrial chemicals, medicinal and industrial oils, electric lighting plants for farms, pianos and five and seven-passenger automobiles, one at $1400 and one at $2200. Quotations should be given c. i. f. Montevideo. Correspondence may be in English. References.

31,282—An engineer in Lettland desires to secure the representation of exporters of agricultural machinery and tools, automobiles, fire clay materials, retorts and fire stones (sketches are requested); and also an agency for the sale of lard. Correspondence may be in English.

31,296—An American firm having a branch office in India desires to secure an agency for sale in that country of medium priced automobiles. References.

New Haven, Conn.—The Fuller Storage Battery Co. of 100 Ann street has bought from Samuel A. Lewis the Orange Street Garage at the corner of Grove and Orange streets, the price be ing understood to be about $65,000. The building, which is at present one story in height, will be enlarged next year by the addition of two stories. The Fuller company intends to conduct a tire and repair business in addition to its battery and electrical equipment lines. The second and third floors will be devoted to the storage of automobiles. The president of the Fuller Storage Battery Co. is Sherman A. Fuller, formerly with the Hartford Electric Light Co., and the treasurer is John E. Bolger, a former newspaper man.

North Tonawanda, N. Y.—The Herschell-Spillman Motor Co. has plans under way for the construction of a four-story addition to its plant. New machinery will be installed at a cost of $500,000, and the company will increase its working force to a total of over 1000, which will enable the company to reach an estimated output of $10,000,000 a year. Production will be devoted to four and six-cylinder motors.

Pittsburgh, Pa.—The Gearless Motor Corporation's new factory building, now under construction in East Liberty, will contain approximately 30,000 square feet of floor space, and it is expected that production of the Gearless Four 36 steam car will be begun in the new factory about the first of the year.

Goshen, Ind.—The Elastic Auto Body Co., Chicago, is arranging to manufacture its product, a combination body for Ford cars, in a section of the Goshen Buggy Top plant. The head of the concern is F. A. Wagoner, and he states that eventually the company will build its own plant.

Boston.—The United Motors Service, Inc., has added to its activities official factory service on Harrison radiators at its Boston branch, 19-23 Jersey street. This product is made by the Harrison Radiator Corporation, Lockport, N. Y., and is a fitting addition to the service that the United Motors is giving on Delco, Remy and Klaxon equipped cars.

Buffalo, N. Y.—The Sentinel Motor Corporation plans to make alterations on its garage at a cost of $8000.

Philadelphia.—The Fanning-Mathis Co., Brown and Broad street, distributor for Marmon cars, has been reorganized, and the name changed to Fanning-Hatch Co. Colonel C. A. Hatch, late of the United States marine corps, has with others, bought out the interests of Senator T. A. Mathis of New Jersey. Colonel Hatch becomes vice president and treasurer, Frank J. Fanning is president and G. D. Armstrong secretary. On the board of directors is John Gribbel, formerly president of the Union League. The Fanning-Hatch Co. has decided to add the Hupmobile to its line of pleasure cars.

Cincinnati, O.—The Sayers & Scovill Co., a pioneer carriage manufacturer, has approved plans for the construction of an automobile assembling plant at Winton Place, a suburb that is being developed as a manufacturing center. The first section will afford 100,000 feet of floor space and it is planned to complete three units within two years. This is stated to be the first factory built here for the construction of passenger cars.

New York City.—The new show rooms for Automobile Delage, 128 West 58th street, opposite the Plaza hotel, have been opened after extensive alterations.

Indianapolis, Ind.—The Lafayette Motor Co. is to build an addition to its plant at Mars hill at an early date.

Brockton, Mass.—The garage operated by Fred O. Josslyn, 37 Martland avenue, was destroyed by fire Nov. 23, a lamp which was being used in vulcanizing an inner tube, setting fire to some waste. The loss was $800.

Jersey City, N. J.—The Hudson County Oakland Co., of which Edward Murphy is the head, will move from Bergen avenue into the new Buick building on Bergen square on its completion.

RIM MAKING A BIG INDUSTRY.

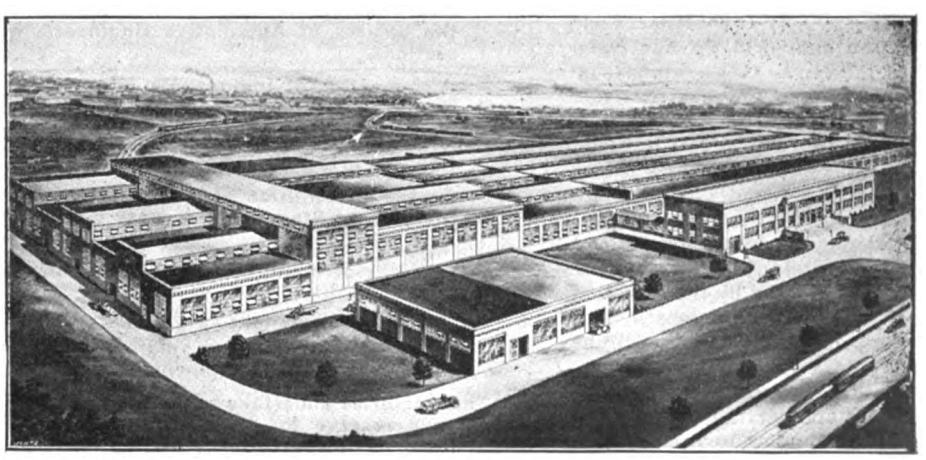
Ground was broken this month at Akron, O., for an additional $1,000,000 plant in the group of Firestone factories. The new plant will house the Firestone Steel Products Co., which annually produces approximately 1,250,000 demountable rims for pneumatic motor car tires and 65 per cent. of the steel bases used in the United States for solid truck tires.

In the new plant the company will have facilities the most modern and efficient obtainable. The main building will be 860 feet long and 250 feet wide. Advantage will be taken of every opportunity to give the workers light and ventilation. The machinery, from large traveling cranes to small riveting devices, will be of the most improved type.

Immediately in front of the main building will be a two-story office building, 170 feet long and 40 feet wide. It will be connected with the main building by covered bridges. A cafeteria for the entire factory force will be housed in the basement of the same building.

Rims manufactured by the company, all of which have been evolved by Firestone engineers, are: Type A a quick detachable, demountable rim; type B, a universal rim, used with either clincher or straight side tires; type C for straight side tires only, and type E a split rim for straight side tires.

Buffalo, N. Y.—The Stewart Motor Corporation has filed plans for the construction of a $10,000 building for an engine testing plant.



The New Plant of the Firestone Steel Products Co., Akron, O., as It Will Appear When Completed at a Cost of $1,000,000.

Service Most Important Problem Industry Must Meet

Convention of Managers at Detroit Develops Need of Standardization, Through Factory and General Policies, and of Training Men for Motor Transport Corps Reserve.

Detroit, Nov. 12.—That service is the most important problem with which the automotive industry, and especially the manufacturers of trucks, must deal, is the conclusion of every person attending the convention of service managers, which closed a three-day session at the Hotel Statler today. The convention was organized by the National Automobile Chamber of Commerce and it was the largest gathering of the kind in the history of the industry.

More than ordinary interest attaches to the convention for a number of reasons, and the first of these is that without doubt a service or service manager's department will be developed by the National Automobile Chamber of Commerce, which body will retain jurisdiction, and suggestion was made that this establish sections in different sections of the country conveniently central to different enterprises, which will operate independently, with frequent meetings, at which pertinent subjects will be considered, the general plan being much the same as that of the Society of Automotive Engineers.

Annually or oftener there will be conventions which will be open to the industry, at which policies will be determined, subject to the approval of the N. A. C. C., and committees will be appointed which will formulate suggestions for service which will eventually be submitted to the chamber and to the different members for approval or rejection.

The meeting passed a resolution that will be addressed to the N. A. C. C., which suggested that the next convention be held at Indianapolis, after Detroit and Cleveland had been proposed as places for meeting, and while no date was stated there was general understanding that this would be determined by the chamber, or at least by the directors of that body. The locations of the different sections will be largely a matter of the desire of those eligible for membership wherever they are in sufficient number to organize.

The policy of the N. A. C. C., as st ted by General Manager Alfred Reeves, is to encourage the organization of service managers and the sentiment of the convention was that so far as possible service should be standardized to afford to the owners of power vehicles the largest measure of practical benefits. By this is meant that each company ought, because of its own interest, standardize its own service and for the benefit of the industry as a whole there should be recognition of a uniform or standard policy by all concerns engaged in the manufacture of power vehicles. This could best be proposed by a central body, which could obtain the ideas of the different companies, and crystalize these into what would in largest measure be most practical. With the large number of concerns operating in the industry determination of opinion with reference to a single policy could not be reached quickly, and dealing with a subject of this importance there was reason to give serious consideration from every aspect.

Report of Committee on Revision.

In this convention, however, there was nothing which will commit the N. A. C. C. At the opening a report was submitted by the committee of the chamber on standard repair parts and service policies, and this was followed with a series of papers on four principal topics, these being in sequence "General Service Policies," "Factory Service Organization," "Service Relations Between Factory and Dealers" and "Relations Between Distributors or Dealers and Customers." Generally speaking the subject of service was broadly dealt with. Regarding the proceedings of the convention as a basis for determination of policy one finds that there was one service department operating plan outlined, and that the other speakers dealt with details of department systems, all of sufficient importance to justify consideration.

Statement should be made that some of the companies have developed service departments that are the results of long experience and large investment, which function admirably, and whatever policy is determined could not consistently be in conflict with these. There is every reason, however, to demonstrate the value of such divisions and present the possibilities of a system.

Would Discontinue Free Repairs.

Without exception the speakers having occasion to deal with the subject, whether directly or in discussion, favored servicing owners to any reasonable degree and the discontinuance of making free repairs. By this is meant maintenance for a stipulated period. The convention was squarely against this, and the belief of some of the speakers was that if free repairing was discontinued there would be possibility of lessening the initial cost of vehicles, for something cannot be given for nothing, and now wherever repairs are made gratis, those who neglect their machines do so at the expense of those who do not, a condition that is so manifestly unreasonable that it cannot continue.

The convention was thoroughly representative and was attended by service managers from all sections of the country from Boston to Los Angeles, and in all 143 were registered as attending, these representing 100 different interests. These may be summarized as 42 car manufacturers, 21 truck manufacturers, 16 car and truck manufacturers, five engine and parts makers, one

PROPOSALS PRESENTED TO SERVICE MANAGERS' CONVENTION.

- Organization of a division of the National Automobile Chamber of Commerce, operating similar to the Society of Automotive Engineers, with local sections.
- Next convention at Indianapolis suggested by resolution to be submitted the N. A. C. C.
- Report of the Committee on Revision of Service and Repair Parts Policies of the N. A. C. C.
- Suggested substitution of Square Deal Warranty for the present Standard Warranty of the N. A. C. C.
- Abolition of free repairing and defining exact responsibilities of manufacturer, distributor, dealer and user.
- That factories standardize servicing and adopt system that will simplify maintenance of Motor Transport Corps equipment in emergent need.
- That factories undertake to train men to qualify them as a reserve for the quick development of the Motor Transport Corps for national defense or offense.

Digitized by Google

tool maker, three dealers, four service organizations, one builder of fire apparatus, one exporting concern, the Motor Transport Corps and five trade publications.

Government Wants Industry's Cooperation.

The participation of the United States War Department as represented by the Motor Transport Corps, U. S. A., was with the object of determining the cooperation of the industry with the military establishment of the country so that a policy could be formulated and the resources of the nation accurately established. There were two primary objects, the one to learn so far as possible the manner of servicing of each company, so that the army in the event of need could obtain sufficient parts for the maintenance of its vehicles, and the other to determine to what degree it could rely upon the industry training men in their work so that they would be available should there be occasion to mobilize any considerable force.

Maj. R. A. Osmun, representing the Motor Transport Corps, outlined the purpose of that branch of the service to maintain four large schools where men could be trained as officers, non-commissioned officers and enlisted specialists, and these men would be the nucleus of a very large department that could be quickly organized in the event of offensive or defensive operations by the army.

Industry Must Train Men for Army.

Great emphasis was placed upon the dependence that must be placed by the War Department upon the industry, for without question a considerable part of the personnel of the Motor Transport Corps in time of need must be drawn from the factory organizations, and logically whatever training of a special character shall be given in the factories must be standardized to meet military requirements.

No plan was determined, but a great deal of information was obtained which will be placed at the disposal of the War Department and with this a plan or system will be proposed that will be consistently operative with the policies of the manufacturers. However, the needs of the nation will go a long ways towards standardizing the service departments of the various factories because there must be cooperation with the government.

In the statements made by Maj. Osmun he made it clear that the cooperation of the industry was extremely important, for in large measure the efficiency of the army for national defense would depend upon the training that could be given men, and there must be a standard that would be adequate for military needs.

Report Dealt Specifically with Trucks.

The report of the committee on revision of service and repair parts policies of the National Automobile Chamber of Commerce was presented by E. T. Herbig, chairman, and as it was developed from a conference of truck manufacturers it applied specifically to trucks, but there was apparently no reason why it should not apply equally well to passenger cars. The committee formulating it was composed of the representatives of three truck manufacturers, two of truck and car manufacturers and two of car manufacturers, so that it could be regarded as equally representing the two divisions of the industry.

Statement was made that the report had not been unqualifiedly indorsed by the National Automobile Chamber of Commerce, but it was at least sufficiently meritorious as to justify submitting it to the service managers for their information and suggestion. The report suggested the abolition of the present standard warranty and the substitution of a "square deal warranty," which would guarantee the best of service so far as maintenance of vehicles is concerned, but would limit the responsibility of the manufacturers to replacement of parts found to be defective of workmanship or material within a period of 90 days from delivery, and make such adjustments as would be necessary to insure normal operating condition for 30 days after delivery, provided the vehicle had not been damaged by accident or neglected or abused. Monthly inspection at the service stations of branches or dealers would be made without charge with report of the inspectors and recommendations, but outside inspections would be charged for.

SERVICE MANAGERS' CONVENTION WAS REPRESENTATIVE.

Trade publications	5
Total interests represented	100

Responsibilities of Each Interest Defined.

The detail of this report is set forth on another page of this magazine. The responsibilities of the manufacturer, distributor, dealer and user are sufficiently well defined, and emphasis is made that free repairing is not to be expected and the owner is expected to care for his property as he would any other utility that might be acquired.

The proceedings of the convention were inaugurated with an address by Roy D. Chapin, vice president of the National Automobile Chamber of Commerce, who stated the object of the assembly and what was hoped to accomplish, and when he retired the sessions were presided over by General Manager Alfred Reeves of the chamber and E. T. Herbig.

The programme for the sessions was as follows:

The First Day's Sessions.

General topic, "General Service Policies;" papers on "Recommendations of National Automobile Chamber of Commerce Committee on Revision of Service and Repair Parts Policies," by E. T. Herbig, sales manager, Service Motor Truck Co., Wabash, Ind.; "Service Relations Between Accessory, Parts and Assembly Manufacturers and Vehicle Manufacturer, Dealer and Owner," by E. A. Haskins, service manager, Federal Motor Truck Co., Detroit; "Should the Factory Encourage Service by Independent Garages and Service Stations? If So, on What Basis?" by L. C. Voyles, service manager, Nordyke & Marmon Co., Indianapolis, Ind.

General topic, "Factory Service Organization;" papers on "The Functions of Direct Factory Service Representatives in the Field," by R. C. Reichel, service manager, Chalmers Motor Car Co., Detroit; "Packard Service Organization," by C. R. Lester, manager technical service department, Packard Motor Car Co., Detroit, and "The Improvement of Vehicle Design and Quality Through Service Records," by Walter M. Ladd, service manager, Pierce-Arrow Motor Car Co., Buffalo, N. Y.

The Second Day's Session.

General topic, "Service Relations Between Factory and Dealers;" papers on "What the Dealers Require from the Factory Service Department," by Ralph C. Rognon, president, Automobile Service Association, New York, N. Y.; "Plan for Regulating Distributors' Parts Stock Supply to Assure Adequate Assortment and Maximum Activity," by H. W. Drew, assistant manager, technical service department, Packard Motor Car Co., Detroit, and "Pirate Parts-Factory Control of the Source of Supply of Spare Parts and Material," by W. M. Warner, manager parts department, Cadillac Motor Car Co., Detroit.

General topic, "Relations Between Distributors or Dealers and Customers;" papers on "The Extent to Which Free Service to Customers Constitutes Good Business," by J. B. Bray, service manager, Grant Motor Car Corporation, Cleveland, O.; "What Is the Most Efficient System of Estimating Charges to Customers for Repairs?" by O. T. Hillshafer, service manager, Chandler Motor Car Co., Cleveland, O.; "The Necessity for Inaugurating an Educational Programme Emphasizing the Responsibility of Vehicle Users as Regards Care and Operation," by A. B. Cumner, service manager, Autocar Co., Ardmore, Pa.; "Service Necessities of the Motor Transport Corps," by Maj. R. A. Osmun, U. S. A.

Discussion of the Subjects.

Discussion followed each of the papers, in some instances to considerable detail, and a great deal of interest was evidenced in the subjects, explanations in response to queries leading to frank statements and frequently diametrical differences of opinion.

Besides the papers some other topics were introduced for discussion, among them being "Should Factory Service Departments Deal Directly with Owners of

Digitized by Google

Large Fleets?" "Should Service Be Rendered Directly to Cars Owned in Territory Adjacent to the Factory?" "Should Factory Discount on Parts Cover Distributor's Profit Without Necessitating Adding Handling Charges by Distributor to Car Owner and Dealer?" and "When Should Service Be Discontinued on Obsolete Parts?"

General Manager Reeves had occasion to make numerous statements relative to the general policies of the National Automobile Chamber of Commerce, to interpretation of rulings on the excise revenue tax as applied to the automotive industry, and explained that the distribution of surplus trucks to various federal departments and to states, inaugurated by the War Department through the Department of Agriculture, which had been suspended because of differing opinions of the provisions of the bills authorizing such distribution, had been resumed, the bills being regarded as valid by the Department of Justice.

Visits to Principal Factories.

The evening of the first day the delegates to the convention enjoyed a theater party. The third day was largely given over to visits to eight of the principal factories of the city, these being divided into four groups of two each, and the visitors having the option of morning or afternoon trips, so that four factories in all could be seen by those who desired. The plants were those of the Hudson-Essex and Chalmers, the Packard and Dodge, the Federal and Michigan State School, and the Ford and Cadillac companies. The visitors were conducted through the works, special attention being given to the service departments, which were explained by the executives of the different companies, so that each individual had opportunity for learning first-handed whatever information was desired. Practically every delegate took part in the factory excursions.

Committee Favors Square Deal, Not Free Repairs

Report on Revision of Service Policies Suggests Clearer Establishment of the Responsibilities for Manufacturer, Distributor, Dealer and Owner.

WHAT was probably the most important paper of the convention of the Service Managers at Detroit was that read at the opening by E. T. Herbig, sales manager of the Service Motor Truck Co., Wabash, Ind., and chairman of the committee on standard repair parts and service policies of the National Automobile Chamber of Commerce, which committee consists of H. W. Drew (Packard), W. M. Ladd (Pierce-Arrow), A. B. Cumner (Autocar), W. M. Britton (Republic), O. T. Hillshaffer (Chandler) and W. B. Riley (Jordan).

The importance was from the fact that the committee had prepared a tentative policy that was to be submitted to the National Automobile Chamber of Commerce for approval, and was desirous of obtaining an expression from the heads of the service departments of the concerns represented. The title of the paper was "Recommendations of National Automobile Chamber of Commerce Committee on Revision of Service and Repair Parts Policies," and it was mainly a proposition to modify the well known standard warranty so that there should be practically no period when the manufacturer would be responsible for what is known as free service.

The paper was substantially as follows:

The National Automobile Chamber of Commerce committee on revision of service and repair parts policies was appointed to consider what changes for the better might be suggested in policies in existence for years. The appointment of the committee was the result of a paper read before the truck manufacturers' convention in New York in which statement was made that existing policies were quite satisfactory, there being no outstanding deficiencies. The majority of suggestions were of minor import and were impelled by the consistent growth of the industry, which justified certain distinctions being made in the text of policies, so as to more fully meet the demands, the general principles remaining unchanged.

The committee made recommendations to the chamber that were not unqualifiedly indorsed. This was due principally to the elimination of the standard warranty. The committee in its report submitted the following for consideration:

In place of the technical obligation called a warranty the committee felt that a set of principles as a working basis and a medium of understanding could well be formulated, in which would be incorporated an expression of the manufacturers, distributors, dealers and users responsibilities respectively. In this connection it should be recalled that the committee's interest has been primarily in the truck industry, the platform designed having specific reference to it.

A reading of the principles or platform will make clear the broad idea in mind and help visualize the demarcation of the lines of responsibility in which the user as well as the manufacturer and his representative shares.

1—Manufacturers: Square Deal Warranty.

Satisfactory relations between manufacturer and user is contingent upon mutual good faith. All manufacturers should guarantee to make good all their just obligations expressed and implied, which will assure each and every user the maximum of truck service at the minimum of consistent cost.

2—Distributors' and Dealers' Responsibilities.

The best maintenance results can be obtained with the user through distributors' or dealers' representing the manufacturers. The distributors' and dealers' service obligations are:

(a) To carry out the manufacturers' square deal warranty with the user.

(b) To maintain adequate facilities for making repairs, adjustments and do general overhauling in a prompt and competent manner at reasonable charges.

SALIENT FEATURES OF THE REPORT OF POLICY REVISION.

- Report submitted with recommendations that were not unqualifiedly indorsed.
- Substitution of "Square Deal Warranty" for the present standard warranty of the N. A. C. C.
- Limit manufacturers' responsibility to replacement of defective parts within 90 days from date of delivery.
- Limit distributors' and dealers' responsibilities to adjustments for 30 days after delivery.
- Provide monthly inspections without limit at branches or service stations, with charge for work done at a distance.
- Practically abolition of free repairing.
- Betterment of service to keep vehicles in operative condition.

Digitized by Google

(c) To thoroughly instruct the user in the proper care and operation of his truck.

3—Users' Responsibility.

The greatest responsibility for satisfactory truck service rests on the user. The responsibility for proper operation and care are entirely beyond the control of the manufacturer and distributor. Upon the user, carrying out consistently and intelligently the instructions on care and operation, depends the success of truck service.

There follows then in the committee's recommendation an outline of the detail practises of the above.

Detail Practises: Manufacturers' Responsibilities—Replacement of Defective Parts.

(a) Within 90 days after the delivery of a new truck to the user the manufacturer will furnish, free of charge at the factory or branch, duplicate parts to replace any parts that are returned to the factory or branch with shipping charges prepaid, and which are determined by the company to have been defective in material or workmanship, or it will put such parts in condition as good as new.

Repair Parts Service.

(b) Discounts to independent repair shops will be subject to agreement between distributor or dealer and the repair shop.

(c) The manufacturer reserves the right to dispose, within 30 days, all parts returned, without assuming liability, unless covered by shipping instructions or adjustment is accepted.

(d) The manufacturer will refuse to consider claims for or accept for adjustment any parts not supplied by him.

Accessory Service.

(e) For service and replacements on engines, starters, batteries, magnetos, generators, carburetors, tires, rims or other trade accessories that are not made by the manufacturer of the truck; application should be made direct to the nearest service station maintained by the maker of such accessory. While not assuming any direct responsibility for articles not made by them, the manufacturer, its branches or dealers will do all that is possible to assure the user of a square deal from the makers of these parts or accessories. If, however, the accessory dealer is not adequately represented in a particular locality the dealer there is obligated to give the user proper service on such accessories.

(f) The manufacturers shall provide dealers with a list of the manufacturers of accessories used on these trucks and a list of service stations.

Distributors' and Dealers' Responsibility: Inspection and Adjustment.

(a) Truck brought to service stations maintained by factory branch or dealer will be inspected monthly without charge. The same service will be rendered at points outside of the service stations at a regular charge based on the distance. Inspection includes examination and report by the inspector of his opinion of the condition of the truck.

(b) Necessary adjustments, to put the truck in standard operating condition, will be made without charge during the first month after the delivery of a truck to a user, provided the truck has not been tampered with nor injured by accident, abuse or neglect. After the first month adjustment will be made at the regular charges of the service station. Adjustment includes only such adjustments as the inspector has, in his opinion, found necessary to put the truck in standard operating condition.

(c) Every dealer is expected to give the same inspection and adjustment service on any truck made by the manufacturer without regard to the territory in which it was bought.

Repairs, Replacements, Etc.

(d) All work not included in inspection and necessary adjustment or installation of replacements will be charged for at regular rates.

(e) When any charge work is to be done and the cost can be estimated in advance, the user, upon request, will be advised of the approximate or maximum amount of the charges before the work is begun.

E. T. Herbig, Chairman, Committee of N. A. C. C. on Revision of Service and Repair Parts Policies.

(f) When it is necessary for the convenience of the user to render service at a distance from the service station, the time spent by employees going to and from the job will be charged for at the regular rates of the station, together with all proper expenses of making the trip, cost of shipping parts, if any, and the necessary incidental expenses.

Overtime Work.

(g) Any overtime, holiday or Sunday work done upon the request of the user will be charged for at the regular overtime rates.

Instruction.

(h) On delivery of a new truck personal driving and maintenance instruction will be furnished for a reasonable period without charge. All other personal instruction will only be given in accordance with the agreement between the customer and the dealer at the time of purchase.

Repair Parts.

(i) The dealer will be required to maintain a minimum stock of both "current" and "service" parts as specified by the manufacturer.

(j) The dealer will be required to furnish an inventory of "current" and "service" parts upon request.

(k) Stocks of parts shall be designated as follows:

1—Current Parts—All parts used in trucks of models being produced by the factory.

2—Service Parts—All parts for models no longer being produced by the factory and which have not been superseded by other parts that are interchangeable with them.

3—Obsolete Parts—Parts that have been superseded by other parts that are interchangeable with them.

Return of Parts.

(l) Parts claimed defective must be returned to the factory with shipping charges prepaid within 10 days from date of replacement.

(m) Obsolete parts may be returned only by individual agreement with the manufacturer.

(n) Surplus parts may be returned only by individual agreement with the manufacturer. All parts shipped to the manufacturer by the dealer shall have transportation charges prepaid and be properly tagged.

We now come to the most important part of the triangle of responsibility—that of the user, whose responsibility has unfortunately been too little emphasized, but who will by the proper dissemination of a plain statement of facts, shoulder his burden of the responsibility and facilitate the service problems, greatly to the benefit of himself, as well as the dealer and the manufacturer.

The facts that should be driven home to him are that he is alone responsible for five commonly neglected features of motor truck operation, which are:

Lack of regular inspection.
Lack of intelligent lubrication.
Loose nuts and bolts.
Overloading.
Overspeeding.

It is impossible to over-emphasize the importance of these matters, which are beyond the control of the manufacturer, and which the user must recognize to be in the nature of an obligation on his part deserving of the most careful consideration if successful operation is to be maintained.

The manufacturer provides an efficient machine capable of successful operation for a period of years, but when the truck is installed the responsibility passes to the user as in the case of any other practical utility which cannot be of infallible construction.

The manufacturer and dealer are interested in the most efficient and economical operation of the truck, but a full measure of cooperation is necessary on the part of the user, who should avail himself of all facilities provided by the service station.

There is no reason why the user should not bear his rightful burden of responsibility, nor do we believe he will fail to do so if we show him the way.

Accessory Service Relations From Maker to Owner

Interests Are Inter-dependent Through Distributor and Dealer, and Best Results Obtain When Parts Selling Is Regarded As a Business That Yields Fair Profits.

By E. A. Haskins, Service Manager, Federal Motor Truck Co., Detroit, Mich.

AN IMMEDIATE clarification of the subject under consideration is obtained if we change the first two words, service relations, to maintenance relations, and the much buffeted word, service, can be relieved of its mystery if given the common sense interpretation "maintenance."

I will, therefore, ask your consideration of the subject "Maintenance Relations Between Parts Manufacturer, Vehicle Manufacturer, the Distributor, Dealer and Owner." In the following discussion we may use the term dealer in a general sense, meaning the vehicle manufacturer's distributing organization.

We will also make two general subdivisions; one the furnishing of parts, and the other their installation (under which will come the general discussion of instruction).

If every seller of merchandise would only have vision enough to realize the value of proper maintenance this subject would need no discussion. Under existing conditions, however, the future sales value, good will if you please, resulting from legitimate business like effort to keep equipment in operation, has been subservient to the idea of production, immediate sales and immediate profit.

Regard Maintenance a Burden.

Some seem to have considered this maintenance problem a burden or necessary evil rather than one of the important divisions essential to the continued popularity and sale of their product.

Others have surrounded it with a veil of mystery, intimating that there is only one place to secure parts and only one way in which parts can be made to perform satisfactorily the function intended. This does not apply to parts other than those covered by the subject under consideration.

To get down to particulars, we like to think of maintenance as vital, but still incidental to the real problem, that is, sale of finished product. We are not in business to sell parts, but to keep equipment in operation. We are not vitally interested where the customer secures supplies necessary to maintain his vehicle as long as the parts are up to the standard necessary to secure best results.

Inter-Dependence of Interests.

There are two ways of visualizing the inter-dependence of all parties under discussion.

First: Consider each as a link in a chain, each one responsible to the link on either side; starting with the parts maker as the ring and through the vehicle maker, distributor, dealer to owner, we find the owner—the man who pays all our bills—dependent for satisfaction upon the parts maker. Mr. Owner does not necessarily appreciate this fact and if the dealer, distributor and vehicle manufacturer, especially the latter, is measuring up to his responsibility, or rather opportunity, the owner will never need to have this forced to his attention. Likewise, dealer, distributor and finally the vehicle maker is hampered or helped by the parts maker's maintenance facilities.

Let us not throw too much of the load upon the ring end of the chain. Let the vehicle manufacturer consider himself a wholesaler or jobber carrying a stock of suitable size to cover several months requirements and endeavor to educate the distributor and dealer to appreciate that they are the retail organization and upon them rest the opportunity of carrying a stock sufficient to care for day to day demands so that the hook end of the chain will really assist in catching additional buyers.

Second: Consider a pyramid with parts makers at the apex and the owner at the base. All our increase in business is based on owners' satisfaction. If the parts maker's product or service is not up to standard the owner will spread his feeling of dissatisfaction so thoroughly as to ultimately hinder Mr. Parts Maker's sales, and he is, or should be, vitally interested in the owner's satisfaction, even though he does not get into personal contact with the owner, as do the other interested parties.

Prices a Potent Factor.

Now for the price: Everything bears a price—even satisfactory service costs something. The question of discounts and list prices has caused much discussion. It is manifestly unfair for the parts maker to establish list prices and discounts so that the price to the owner, if passed direct by him, is much different than when handled by the vehicle manufacturer and his distributing organization. I say much different advisedly for it has never been our policy to attempt to hold to a parts maker's list if this provided a greater or less profit than considered legitimate. We have endeavored to make our service and parts division sufficiently attractive so that after the dealer has been properly started by the vehicle manufacturer he will have real financial reason for keeping it up. The real fundamental of maintenance is speed or promptness of repairs. What matters a few cents more or less compared to a vehicle tied up for several hours or days?

It would greatly simplify matters, therefore, if the parts maker would establish a discount sufficient to enable his list price to mean something only as a comparison. Let him protect the vehicle manufacturer regarding deliveries and not supply owners or dealers direct when he is not shipping the same parts to the vehicle manufacturer, who may have orders for similar parts which have remained unfilled for some period.

Make the Distributor Headquarters.

If the distributor is worthy of the name let him be the headquarters for parts and repairs in his territory. If the party nearest the owner is honestly trying to give service, justify his efforts, do no more yourself than you are legitimately asking him to do. Do not let anyone get the impression that he can get any more by going over the dealer's head.

PERTINENT POINTS IN ACCESSORY SERVICE POLICIES.

- Keeping equipment in operation has been subordinated to production, immediate sales and profits.
- Maintenance an important sales division and not a burden upon business.
- The real fundamental of maintenance is speed or promptness of repair.
- Manufacturer should protect the vehicle builder on deliveries.
- Dealer should be headquarters for parts and repairs in his territory.
- Makers of highly specialized products should establish own service stations.
- Parts makers should thoroughly instruct dealers, through vehicle builders, in maintenance.

Digitized by Google

We have no patience or sympathy for the dealer who does not make a real honest effort to help the owner; factory help in his territory is charged to him after the first visit.

Let us all protect the party next in line on the hook end of the chain whenever he is trying his best, but it is of paramount importance to keep the owner happy, even at the sacrifice of pride or immediate profit.

If the parts manufacturer's product is of a very specialized nature, demanding more care, knowledge or experience in its maintenance than can be expected of the vehicle manufacturer's dealers force, let the part manufacturer establish his own widespread repair system and work with the dealer in caring for such work. We can see no reason why the vehicle manufacturer should receive any remuneration in any fashion from such work which has been performed without his knowledge or assistance and without material in which he has his money invested.

Keeping Ahead of Parts Design.

The parts manufacturer should appreciate the necessity of keeping the vehicle manufacturer informed in advance of proposed changes in design, so that we all may have an opportunity of preparing to care for these changes and not wait until such changes are in production.

As an ideal we, therefore, have the owner cared for by the dealer who has a reasonable stock of most active repair parts and dependent upon the distributor for replenishment of his stock and for

E. A. Haskins, Service Manager, Federal Motor Truck, Detroit, Mich.

parts seldom used, as well as expert mechanical assistance and instruction. The distributor in turn depends upon the vehicle manufacturer for his supply of parts so that his efforts can be roughly checked. Failure of any one of these should permit of the owner's request upon the parts maker receiving prompt and immediate attention in such a way as the other parties can be kept informed of their shortcomings, so that proper action can be taken to prevent repetition.

The price demanded by the parts makers from the owner should be sufficient to discourage such relations if the dealer is honestly trying to maintain the owner's equipment. We believe that the parts maker's price should be greater than the vehicle manufacturer's list so as to discourage direct dealing unless the vehicle maker or dealer is not making an honest effort in the owner's behalf.

The furnishing of parts is given the position of importance due to its being by far the most important feature of satisfactory maintenance. Parts themselves, however, are of little value unless properly installed. Therefore, every vehicle manufacturer should be able to secure suitable instruction from the parts makers so that he in turn can properly instruct the dealers' organizations by means of shop courses, schools and printed instructions.

Let us all help, not hinder. There is no such a thing as free service. Therefore, if it costs money, charge for it; if we are wrong, admit it. Give uniform treatment. Make anything worth while worth money to be appreciated and some of our problems will be simplified.

Factory Must Support Dealer Service Stations

Should Discourage Independent Shops That Flourish Upon Dissatisfied Owner Custom and Protect Their Own Organizations and Sales by Highest Grade Work.

WHETHER or not the manufacturers should stimulate the repair of machines outside of the organizations of the distributors and dealers was considered in a paper on "Should the Factory Encourage Service by Independent Garages and Service Stations? If So, on What Basis?" by L. C. Voyles, service manager for the Nordyke & Marmon Co., Indianapolis, Ind.

He assumed that the ideal of every manufacturer was to satisfy each owner, and while this was not 100 per cent. practical, the nearer this standard was approached the better. Were it possible for the owner to take his car to the factory for adjustment and repair the possibilities of affording satisfaction would be much greater, but obviously this was out of the question because of the scattered distribution, and so a general operating plan was necessary. Experience had proven that it was best to make this service a part of the duty of the dealer, and for that reason the work had been included in the contract made with him.

The dealer must have shop facilities, with sufficient space, tools and equipment and special machinery and an efficient force of trained mechanics, as well as an adequate stock of parts. The degree of attention given to this phase of the business was rarely what it should be, and it was this condition the industry was now suffering.

After a dealer has met the requirements for maintaining service and has established a shop and invested his capital, is it fair to encourage independent repair shops? He himself did not believe this policy was consistent.

Independent Shop Customers.

Two classes of owners were affected by the independent garage or repair shop, the first including those who go to them deliberately, possibly from disagreement or because of dissatisfaction, and the other includes the tourists. The latter class may be influenced by advertising or by signs displayed.

If the factory receives too large a number of complaints, the ratio being based on the number of car owners, from a certain territory relative to the service afforded, the condition should be immediately investigated, to determine the cause and bring about such change as the needs of the instance demand. This cause may be the shop personnel. The mechanics may assume to know more about mechanical construction and operation than the engineers and designers. There is a possibility that they are going too far in making changes, or it may be that the design or the construction of the machine is the cause. Perhaps it may be that it has been used in conditions not anticipated and certain changes are necessary. This may be true of new types.

Factory Should Maintain Standard Service.

Whatever the cause, the factory should make correction through the dealer rather than through the independent

Digitized by Google

shop or garage. Not to do so is first to admit that the dealer's service is not adequate, and second that it is not possible for the factory to make its product serviceable. The surest way to keep owners from independent shops is to have our own so good that the owners shall be satisfied.

The time is not far distant when a dealer's service will determine his sales success. Even now it is a very important factor in a reorder. A good dealer is seeking to improve his service. This is a sales as well as a service problem and calls for the closest cooperation between the sales and the service departments of the factories.

The success of the independent garage shop depends largely upon the differences of the dealer and the customer, and rather than increasing these differences the factory should endeavor to reduce them by cooperating with the dealer. All of us have received letters from owners stating that a dealer could not do this, that or the other, and that it was necessary to take a car to a friend, who is an excellent mechanic, who tells him the cause and that restoration will mean a considerable expense. Very often the owner wants an opinion from the factory with reference to the proposition of the mechanic, and occasionally the factory is asked to bear a part of the cost of the restoration.

Advise Owners of Dealer's Service.

Why could not the owner be told that the repair man exists by the cars he works on and that he sells his work by telling the owner what may or may not be necessary? If an owner were to receive a letter from a factory stating that the dealer is qualified to afford him service and advise him if the work recommended is necessary or not; that the dealer is interested in the success an owner has with his car; that the dealer's men are experts with it; that he has the equipment with which to work; that the friend may not be familiar with the clearances or limits of the car; that he may not be familiar with its construction—then the owner may stop, look and listen. If the dealer cannot do what has been stated of him and his shop, then he is not a first rate dealer and it is up to the factory to see that such changes are made as will insure service.

Sometimes the repair man may be a former employee of the dealer, who has engaged in business and expected to take with him some of the dealer's customers. He may be a competent mechanic and we have no quarrel with him, but we must protect our own interests.

WHY FACTORY SHOULD ENCOURAGE DEALERS' SERVICE.

- Experience has proven that this work had best be done by dealers' shops.
- In event of dissatisfaction the factory should bring about a change in shop methods and personnel.
- Should advise owners of practicalities of dealers' service.
- Owner should inherit expense and inconvenience of work of independent repairers.
- Factory should control service where conditions necessitate work in shops outside dealer territory.

All Service Through the Dealer.

There are no doubt instances where a man can make excellent arrangements with a dealer and do work to the advantage of all concerned, but such an arrangement should be worked out through the dealer, who should be responsible for the work and the plan of operating.

It is the unreliable, incompetent man, who has no interest in the owner other than the money he can get, that we must protect ourselves against. We cannot refuse to sell parts, but if no discount is allowed and the owner finds he can get parts more promptly through the dealer, he will eventually go to the dealer. Owners have the right to take cars anywhere for work upon them, but they also have the right by so doing to inherit the expense and inconvenience consequent with doing business with those who do not directly represent the factory.

The former employee may believe he can do as good work, and may have signs that convey the impression he has a dealer service station, which is not fair nor legitimate. Legal action may be taken if it can be proven that this was done with intent to deceive, but such action may lead to impressions of discrimination and aggravate conditions instead of improving them. The best protection is for the dealer to have his departments so organized and equipped and efficient that he can give the best of service.

Sometimes small shops send owners to buy parts at dealers' establishments, and such visits give the dealers chances to deal direct with the owners, which may lead to adjustment of differences and resumption of business relations.

Service in Open Territory.

All of the above has been assumed with reference to a dealer's territory. There may be cases in a territory, very large or sparcely settled, where all the cars cannot be brought to a dealer's station, in which event it is obligatory for the dealer to arrange through some local repair shop for service, but not through the factory, and the dealer should be held responsible for the service. The dealer should see that the repairer is familiar with the car and that he has the shop equipment and the mechanics that can give service. If there is doubt of this the repairer's men should devote such time as is necessary to work in the dealer's shops, or vice versa, for the purpose of instruction and qualification.

In large cities it may not be possible from either the dealer or the owner standpoint to have all of the cars brought to one point, and the dealer can take such steps as are necessary to insure service in all sections. It is up to the dealer to carry out his obligations and responsibilities.

Where an owner lives in an open territory, if there are a sufficient number of cars in use the dealer may arrange for service from a local man, but this should be on the basis of a contract and the repair man should be responsible and the factory should have jurisdiction and protect the owner and the dealer.

When changes of dealers were made, as in past years, owners may have felt that they were justified in taking cars to other places for work on them. Thus the factories have been responsible, and, being responsible, they must do their part to bring about changes.

The business is better established and the automobile dealer today is as legitimate as any merchant. Many times the quality of a car is judged by the reputation of the dealer. He must be a business man and having this qualification he must have factory support instead of what will lead to confusion and encourage the independent shop.

Function of Direct Factory Men in the Field

THE development and results obtaining from a system that had comparatively recent origination was dealt with in a paper read by R. C. Reichel, service manager for the Chalmers Motor Car Co., Detroit. He pointed out that the reduction of the cost of service was the same as reducing the price of a car and he believed that the owners of cars would buy better cars if they were confident they would be taken care of at the small service stations. If the cost of service to owners can be lessened a much larger market is automatically opened to the sales department.

One of the causes of the high cost of service is the neglect to determine every mechanical cause of failure. Every machine has its peculiarities and if it is not perfectly understood more or less unnecessary work is done and the cost is unnecessarily increased. If we can get the right kind of mechanics we can reduce the cost 50 per cent. He personally believed that a man was not qualified to do work with a minimum of labor unless he had done the work at least once.

Digitized by Google

and the longer experience was by far preferable.

As to obtaining mechanics: Considering both outside and factory schools it was only practical to cover from one-fifth to one-half of the territory where the work was most needed. The small dealer cannot send men to schools because of the expense of educating them, and should he do so the men will go to larger places where the wages are higher and the work more standardized as to hour of labor. Mechanics always want to work on a definite hour basis. For these reasons the small dealer quickly loses his trained men. Not only this, the schools deal largely with theory and seldom with actual conditions, but if they have the work to do comparatively few men get the full benefit of the experience.

Dealers Used Road Men as Mechanics.

With reference to road mechanics, the original idea was to send men to instruct or advise the dealer's help, but these men have been used by the dealer and distributors as additional men and for this reason their work has often been useless to the factory. The men only handle one kind of trouble and go from place to place, so that the mechanics of the shops are just as helpless as ever. Road men that are mechanics only do not handle other necessary details; they do not see to keeping up the stocks of parts at minimum investment, neither do they give attention to the personnel nor appraise the value of the shop of the tools and equipment.

Some use stock auditors and service mechanics to cover all of these details, but this is a big disadvantage because the auditor only sees from his angles and the mechanic from his, but if the responsibility for the dealer having an efficient, well organized, properly conducted service department rests upon one man who is well trained, maximum results are obtained.

Field Men Control Chalmers Service.

Concerning service representatives, the plan his company has used for 18 months has been practically tested. This has been found to come nearer the answer to improvement of service than any that has been developed. The service representatives are personally responsible for the service given by the distributors from all angles. They check the distributors' stock, insist on accurate stock record, demand that the dealers summarize stock to eliminate slow moving and dead stock, keep the stock investment to minimum, check the tools and equipment, make recommendations for necessary tool equipment, check for cleanliness, light, arrangement of tools, etc.; check the personnel and make recommendations for changes, either through the department at Detroit or through the managements of the concerns. They see that all mechanical needs are handled by the distributors' mechanics. They are not permitted to get into overalls or do any work save in extreme cases. They serve as instructors and only supervise the work and the mechanics are usually qualified to meet the demands upon them. They only call on the distributors.

R. C. Reichel, Service Manager, Chalmers Motor Car Co., Detroit, Mich.

This system does not leave the small dealers in as bad a condition as before as the factory insists on the distributor having service representatives who are practically the same type of men as the factory service representatives, who handle their work in the same way. The service men call on the distributors every 30 days and check on the same points and details as the factory representatives check with the distributors, and give the dealers' mechanics the same instruction as is given by the factory service representatives.

The factory representatives take the time to see that the distributors' representatives are fully informed and where necessary will go to one or more dealers with a distributor's representatives. In this manner every place where there is a Chalmers dealer is covered, which eliminates much mechanical work. The factory and service representative is the personal contact between the factory and the distributors in all service matters. Service complaints, unusual claims and all matters of this kind are covered by the representatives with the distributors.

VALUE OF UNIFORMITY OF WORK IN DEALERS' SHOPS.

Reduction of service cost automatically increases the market for vehicles.

With the right kind of mechanics the average expense can be reduced 50 per cent.

Factory representatives to supervise service must be specially trained men qualified to do this work.

Distributors afford the same character of supervision for the small dealers.

Shop efficiency is increased and the satisfaction of the owner insured at relatively reduced expense.

Results Are Extremely Satisfactory.

Some of the results are a 60 per cent. reduction of the technical correspondence, the elimination of nearly all unjust claims, great reduction in the volume of material parts replacements on account of the service representative being able to suggest good methods of restoration without the installation of new parts, a reduction of the number of cars held awaiting parts shipments from the factory, through the service representatives being able to arrange exchange of parts between distributors on factory shortage items, the elimination of unnecessary checking of complaints at the factory caused by complaints being made from territories that are not accurate, giving the factory a quick check, and restoration on failures developing through the immediate reports of the service representatives (the reports being accurate because of the knowledge of the men), the reduction of sales resistance by having a personal check on complaints, and having at the factory clear information of the distributors' service departments, so that if a distributor feels that his service cost is running high we can talk to him on the basis of whether his cost is high because of his own service department's inefficiency, or whether the cause is the car itself.

In work of this kind the type of man is important. In developing this organization we took the pick of the former road mechanical force and have built these men up to the needs of the factory. In doing this we gave them ample time at the factory, in the service department handling claims, technical correspondence, parts orders and parts order routine, so that they were familiar with all of those divisions, and also learned the mistakes being made from the territory and in handling the distributors' business with the factory. We have found the men developed in this way are very glad to have the opportunity to broaden, and we are confident that in developing them the factory is developing men who will later control the territory sales work. From his point of view good motor car salesmen must be thoroughly informed on all angles of the business, including mechanics, service, sales, etc.

CLEAR STREETS FOR FIRE TRUCKS.

A recent proposal in Seattle, Wash., to move fire apparatus to a point further distant from the center of the city, brought out the fact that, while it is unquestionable that motor driven apparatus travels so fast that the factor of distance has been practically eliminated, at the same time it is said that the increasing use of other motor vehicles has brought about a congestion in the streets that cannot be lost sight of. Given a clear street and the motor apparatus can make quick time, but the chances for a clear street are diminishing every day. Street congestion is compensating unfavorably for the additional speed of motor driven over horse driven apparatus, and as a consequence the factor of distance from the area of maximum fire risk is still considered important.

OVERLAND STANDARD OF TESTING.

The Willys-Overland Co., Toledo, O., believes that in testing out its latest model, the Overland Four, before presenting it to the public, it established new standards of testing and refinement of details to make a car as near perfect as possible mechanically before it goes to the owner.

The history of the development, building and testing of the Overland Four, which introduces the three-point spring suspension, covers a period of years. The car is the product of a decade of progressive engineering achievement toward the ideal light weight car; of a year's intensive engineering experiment and two years' actual demonstration and tests in all kinds of weather and over all sorts of roads.

During these two years of tests the Overland Four was 250,000 miles of actual road demonstration—10 times around the world—before a single car went on the market. This may be compared with the usual 25,000 to 75,000 miles of demonstration. They were of great value to the engineering and production departments of the company, and, finally, to the man who buys the car. The section of the country where they were held was the Southwest, Colorado, New Mexico and Arizona, where nature seems unfinished—a rough, rock-strewn, tortured country. A staff of engineers accompanied the fleet of Overland Fours to watch every hour of the performance. Here the three-point suspension was tried out to the utmost and found efficient in providing easy riding and adaptability to all conditions of roads, while the all-steel construction gave it an unusual stamina.

JERSEY CITY SHOW IN FEBRUARY.

The members of the Hudson County Automobile Trades association have decided to hold an automobile show in Jersey City, N. J., some time the latter part of next February. Edward Cox, the president of the association, has appointed a committee to report on a date and place. The Fourth Regiment Armory is considered as the most appropriate building for holding such an event, which will be continued for one week.

The association realizes the value of co-operation between dealers and is assured of the publicity benefit to the trade in such a show which would make a direct appeal to the half million people residing in Hudson county.

SIX SPEEDERS SENT TO JAIL.

Magistrate Frederic House of the New York Traffic court on Monday, Nov. 24, sent six men, who were arraigned on charges of speeding, to the city prison to serve sentences varying from five to 15 days, they all having been up for the same offense at least once before.

In pronouncing sentence Magistrate House said that as fines did not seem to do any good, he felt convinced that the only way to check speeding was to send the offenders to jail.

Features of the Automobile Salon

THOSE who have depended on the annual fall Automobile Salon in New York for the last word in whatever is elegant, rare and unique in motor car construction, both domestic and foreign, anticipated this year's exhibition in the Commodore hotel with unusual interest on account of the omission of the event a year ago because of war conditions. This was the first time the Salon was held at the Commodore, as previous shows have been held at the Astor. The ball room, its ante-rooms and foyer were all occupied, the ball room proper being decorated from ceiling to floor with festoons of American flags, draperies and foreign emblems significant of the various countries represented, and held within the folds of these decorations were plush banners carrying the name of each make of car over the space occupied by it.

The limited number of accessories on view were allotted space in the foyer. These included such leaders as Smith speedometer, the Rees automobile jack, Klaxon telephones, Faure tires, Laidlaw upholstery fabrics, the Westinghouse air springs and Dunlop tires.

While several exhibitors were prevented by labor troubles at factories from showing all the chassis mounted with bodies, this was compensated for by the unusual interest visitors seemed to take this year in examining the latest refinements in mechanical features. There was a good opportunity afforded for the comparison of Italian, French and English types with those of American make, as each of these foreign countries was well represented. The Sunbeam, Delage and Lancia each had a chassis on view, the Sunbeam and Delage being shown for the first time in this country, being hitherto best known here as racing models of speedway events.

America presented one new American chassis, the Dupont, which is the latest high priced American car put on the market.

The exhibits were as follows:

Sunbeam, two six-cylinder models; Delage, five-passenger touring car and one chassis; Lancia, four-cylinder chassis; Renault, four chassis and coupe-limousine with body by Kellner, Paris; a limousine with body by Ferber of Paris, and a coupe-limousine with body by Henry Binder, Paris; Du Pont, four-passenger touring car and chassis; Locomobile, chassis and four-passenger sportif body, special custom made six-passenger cabriolet, six-seated coupe, six-seated sedan and a seven-passenger limousine; ReVere, five-passenger touring car with Victoria top, racing roadster with disappearing assemble seat and four-passenger touring car; Cunningham, six-passenger touring car, six-passenger enclosed drive, four-passenger town landaulet and four-passenger sedan; Daniels, chassis with disc wheels, seven-passenger with victoria top, six-passenger landau-brougham, seven-passenger suburban and three-seat-coupe; Porter, chassis and an enclosed drive limousine, five-passenger touring, two seven-passenger touring cars and a large size falling front landaulet; Brewster, runabout, landaulet town car, country brougham and enclosed drive limousine; Singer, chassis and four-passenger sport model; Meteor, four-passenger touring car; Rolls-Royce, cabriolet with body by Barker of London, also a model in miniature of the Vimy airplane in which Alcock and Brown made their trans-Atlantic flight, which was equipped with Rolls-Royce motors.

Very handsome new body models mounted on chassis were shown by Barker of London, Brooks-Ostuk, Rubay, Holbrook and the Fleetwood Co.

Among the novel features of this year's salon were the aviation exhibits. These included the Hispano-Suiza, shown by the Wright-Martin Co., the 300-horsepower Renault aviation motor and the miniature Vimy type Vickers airplane mentioned in connection with the Rolls-Royce display.

Mechanically all the cars shown were pronounced by experts in attendance to be masterpieces, and all agreed that the coach work has set a new standard for America. From the standpoint of sales the various companies represented reported that they enjoyed the most active days in the history of the Automobile Salon.

VERDICT AGAINST FORD CO.

A verdict of $600,000 has just been awarded in the Federal District court of New York to the Hotel Woodward, Broadway and 55th street, in its suit for $1,000,000 against the Ford Motor Co. for alleged breach of contract.

In 1914, according to the plaintiff, the Ford company agreed to erect an annex to the hotel, wherein there were to be 300 rooms, the ground floor to be a sales room for the automobile concern. What with the scarcity of rooms and the present day profits in the hostelry business, the hotel company estimated that its possible profits lost when the Ford company failed to build the annex were easily $1,000,000, The case had been on trial for about two weeks and the jury rendered the verdict for $600,000 after a short consultation.

USED 216 TYPES OF AUTOS.

During the recent war emergency, 216 different types of passenger cars and trucks were represented in the 150,000 machines purchased by the United States war department, according to the annual report of Brigadier General Charles B. Drake, chief of the motor transport corps.

ACCESSORIES, EQUIPMENT AND TOOLS FOR THE GARAGE AND REPAIR SHOP

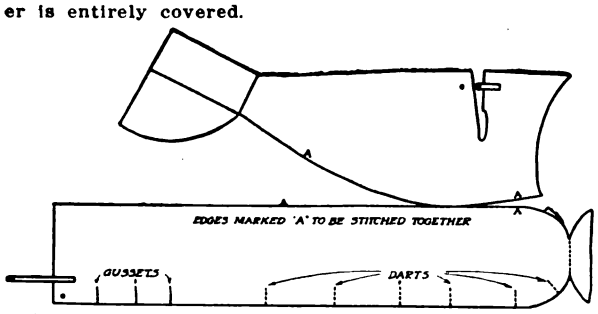
The Corrugated Lock Washer is a patented invention that came into use during the war period and was largely used in aeroplane construction. Instead of the single bearing surface provided in the ordinary lock washer, the corrugated lock washer has six bearing surfaces that give

added securities to the bolt and nut fastening.

Manufactured by the Smith & Hemenway Co., Inc., 281 Broadway, New York City. Prices and literature on application.

Fender and Door Protectors for the garage and service station are for the use of repairers when working about the engine and the interior of the car. The protector is placed over the top of the fender when the repairer is working on the engine and at the bottom of the door when working about the interior of the car.

The protector is made of a leather substitute, consisting of a strong cotton fabric base coated with pyroxylin "dope." A pocket along one edge allows for the insertion of the fender. A flap on the inside of the cover runs down on the inside of the fender in such a manner that the fender is entirely covered.



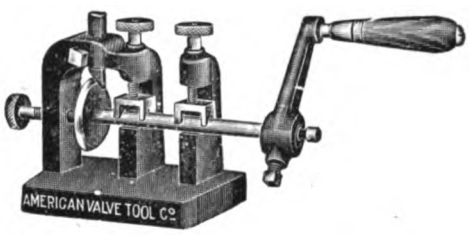
The material of which the protectors are made has a heavily napped back, which provides protection for the polished surface of the fender. The protector is thick enough to cushion any ordinary friction or blow. The covers may also be used to protect the cars while standing in garages, preventing injury to the doors or fenders by being struck by other machines while being moved in or out of their stalls in the garage.

Similar protectors are being used by garages to protect the upholstery of cars from being soiled by the greasy clothes of the repairer. Oil or grease that soils the protector may be easily washed off with soap and water.

Manufactured by the E. I. du Pont de Nemours & Co., Wilmington, Del. Prices on application.

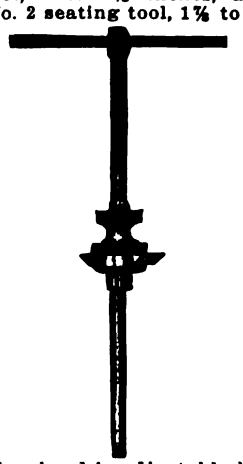
American Adjustable Valve Facing and Reseating Tools comprise two separate devices, one for refacing valves and the second for reseating the valve seats of automobile and truck engines.

The valve facing tool is a bench tool, in which the valve to be faced is placed and turned against a cutting tool by



means of a handle fastened to the valve stem by a set screw. Adjustment of the valve is made by a thumb nut at the head of the valve and two adjusting screws over the stem. The cutter is adjustable for valves of various diameters.

The adjustable valve seating tools consist of a reseating head having four cutters, a suitable handle for turning the cutter head and an extension rod that passes through the valve stem bushing to keep the cutter in its proper position. Two sizes of rods are provided with the No. 1 seating tool, 1 to 1⅞ inches, and three with the No. 2 seating tool, 1⅞ to 3 inches.



The cutting head is adjustable by means of two knurled nuts at the top of the cutter head. Loosening the top nut also loosens the lower nut enough to set the cutters to the desired width. Tightening the upper and lower nuts fastens the cutters securely.

Manufactured by the American Valve Tool Manufacturing Co., 354 West 50th Street, New York. Price for complete set, $20; all tools guaranteed.

"Ha-Maa" Hudson Automatic Manifold Air Adjuster is a device that governs the flow of air to the intake manifold of the Ford or any other light engine. It consists of a brass nipple that is threaded into an opening drilled and tapped in the center of the manifold and a special hex cap that contains a ball valve, spring and plunger.

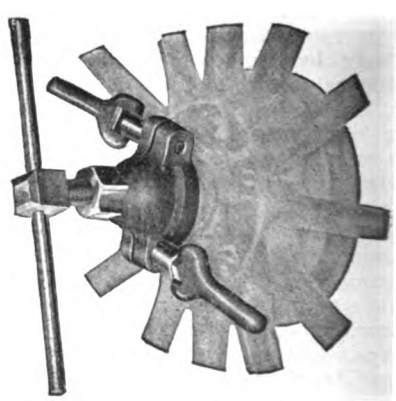
The object of the device is to admit air into the intake manifold of the engine in quantities to suit the varying speeds of

the engine, and it is stated that air so admitted will allow the engine to show a greater speed with a smaller consumption of gasoline than when the "Ha-Maa" adjuster is not used.

To test the device the carburetor should be set properly before the air adjuster is attached. After attaching the adjuster it will be noticed that the engine will show more speed and the needle valve may be closed slightly.

Manufactured by the Hudson Motor Specialties Co., Real Estate Trust Building, Philadelphia. Price, $1.50.

American Ford Wheel Puller is somewhat heavier than the usual type of wheel puller for the Ford car and is made with two clamps instead of the conventional one clamp. The device consists of a heavy casting, threaded for screwing over the



threaded hub of the wheel, two clamps for setting the threads closer in mesh and a powerful screw and handle for forcing the wheel off from its keyed seat.

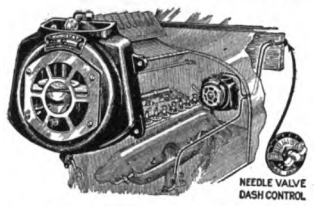
Manufactured and sold by the Fairbanks Co., New York. Price, $5.

Digitized by Google

The "Humistat" Attachment is a vaporizing device that is attached to the dash of the car under the hood and is connected by a copper tubing with a control button and needle valve on the front of the dash, and is connected to a nipple on the intake manifold above the carburetor.

The Humistat is designed to introduce water in small quantities, determined by the needle valve control to the engine through the intake manifold. It is stated that engine operation is obtained by using the Humistat similar to that obtained when driving a car during the evening when the air contains more or less moisture.

The floating spray feature of the attachment is patented, supplying moisture in uniform quantities under varying conditions of engine operation, and subjects the small bubbles of air to a greater water



contact than formerly, it is claimed, giving high vaporizing efficiency.

The Humistat attachment may be used during cold weather as well as during the warmer months and only in the severest weather will it be found necessary to drain the water, the heat of the engine keeping the water in the container from freezing during moderate weather. The water capacity of the Humistat is ample for 400 to 500 miles with one filling.

Tests in actual operation on many makes of cars have shown that the Humistat will keep engines snappy and cause them to deliver nearer their full power.

Sold by the Pettingill-Andrews Co., New England distributors, automobile division, 100 Brookline Avenue, Boston, Mass. Prices and literature on application.

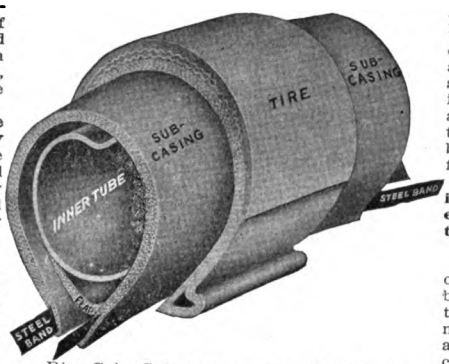
Fisher Rim-Grip Sub- Casings are made to fit the inside of weak or partially worn casings and act as a reinforcement for the tire and also allows the car owner to get considerable additional mileage from his tires.

Rim-Grip Sub-Casings are made somewhat different than the usual run of interliners, as they are formed much like the ordinary fabric tire, that is alternate layers of fabric and rubber are cemented together in a mold and formed in the shape of the tire that they are to fit. The edges are reinforced with strips of metal as in a

THE Fisher PATENTED RIM-GRIP SUB-CASING

casing, giving added strength, and preventing the sub-casing from creeping or turning. Flaps are used in the larger subcasings, while in the Ford car sizes they are omitted, as it is impractical to use them with the Ford type of clincher rim without pinching the tube.

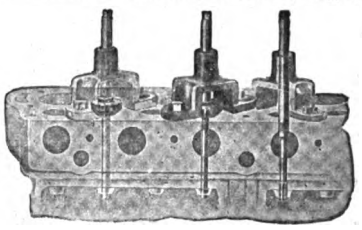
The manufacturer states that it is possible to use Rim-Grip Sub-Casings with tires that have rim cuts or stone bruises that would usually make it necessary to throw away the tire, and that the additional mileage gained will more than pay for the sub-casing, although it is suggested that a better plan is to place the subcasings in the new tire and allow the tire to run until it is completely worn out, when the sub-casing may be placed in another tire and used in the same manner, repeating the process till the sub-casing is entirely worn out and unfit for further use.



Rim-Grip Sub-Casings are shipped, including instructions for fitting them to tires and they may be applied by anyone who desires to do the work, as the instructions are very simple.

Manufactured by the Fisher Rubber Co., 1816 St. Clair Avenue, Cleveland, O. Prices on request.

Storm Valve Port Renewing Tool is especially designed for the Ford engine but may be used on some other makes of engine blocks. The manufacturer states that the valve port renewing tool enlarges the port, forming a new narrow seat similar to that on a new engine and produces a new stem guide which, when fitted with 1/64-inch over-size valve stems, makes the entire valve system as good as new. Attention is called to the upper jig or guide that is provided; it is said that this is the only way absolute accuracy may be obtained. This jig is secured to the engine block by two bolts which fit into the

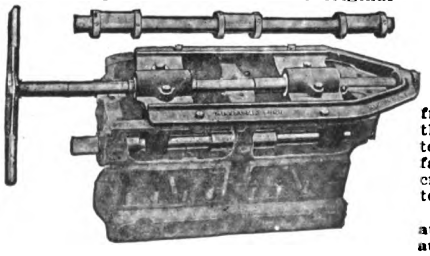


cylinder head bolt holes and remain in position until the operation is completed. The jig is then moved to the next port by the removal of one bolt.

On an engine that has been subject to considerable wear where the valve seats have become widened by use and repeated grindings, the Storm renewing tool is a quick and efficient remedy, as the enlarging reamer cuts away a portion of the old seat, enabling the reseating reamer, which is next used, to cut a narrow seat. Worn valves may be remedied by reaming to over size by using the valve stem guide reamer.

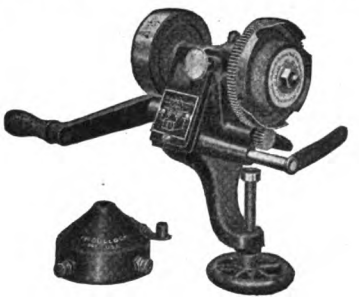
Manufactured by the Storm Manufacturing Co., Minneapolis, Minn. Price, $15.

New Storm Tool for Aligning Ford and Fordson Main Bearings provides a rapid means of aligning faulty main bearings, consisting of a babbitting jig and boring bar. The new Storm tool is said to make a new perfect bearing exactly the same as the original and in the same original position. The jig which holds the babbitting arbor and the boring bar is held in correct position and alignment by an aligning arbor passing through the cam shaft bearing holes. The babbitting arbor is 1/8 inch smaller than the crank shaft, allowing ample space for the pouring of the metal and providing surplus metal to be cut away by the boring bar, which has four cutters for each bearing.



Manufactured by the Storm Manufacturing Co., Minneapolis, Minn. Price for Ford engine only $70. Price for Fordson tractor engine on application.

The McCulloch Timer Grinder is a hand or belt power grinder that may be used by repairers for regrinding the inner contacts of Ford and Fordson timers. The machine is clamped to the work bench and the power supplied either by the crank at the side or the crank may be removed and belt power substituted. The timer is placed in the special chuck and held securely while being ground by the flat retaining spring which fits the end of the timer case. The handle is turned in a clockwise direction while the milled screw is fed in an anti-clockwise direction so



that the spring comes into action to keep the timer in register with the stone.

It is claimed that the McCulloch grinder will grind timer cases that have become practically worthless through wear, in a few moments time and will give to the timer case a glass like surface, keeping it perfectly true with the outer shell. When used with power the handle is unshipped. When not in use as a timer grinder the small stone and the timer chuck may be removed and the machine used as a precision grinder for grinding small tools, drills, etc.

Manufactured by the A. P. McCulloch Machine Co., 216 High Street, Boston, Mass. Prices on request.

Toptite Dressing is stated to be a perfect dressing for tops and seat cushions made of fabric, leather, pantasote or mohair. It waterproofs, preserves and renovates top and seat cushion coverings, producing a fine, permanent finish that is claimed to be lasting. The ingredients

from which Toptite is made are the best that the market supplies and are claimed to contain nothing that is injurious to the fabric or other covering and will not crack or smut the clothing when applied to seat cushions.

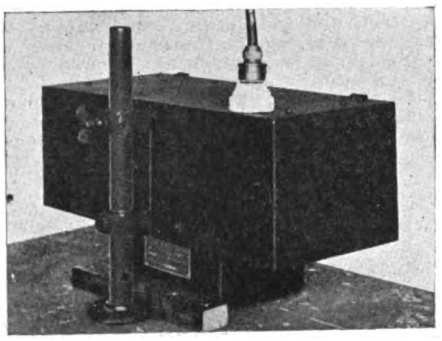
Manufactured by the Woodtite Laboratories, Modesto, Cal. Prices and literature on application.

Digitized by Google

Hydrate Electric Battery Oven is a device for softening the wax of storage batteries, allowing the jars to be easily removed and examined.

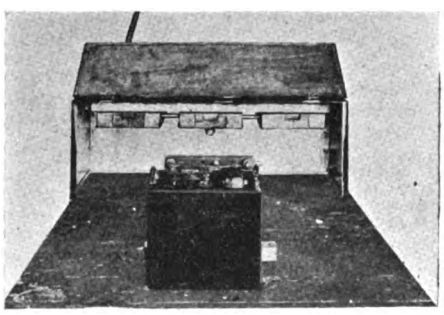
It consists of an enclosed box, having a suitable heating coil that is connected through a lamp cord to any convenient lamp socket. The battery is placed under the box the current turned on for a short time and the exterior solid parts of the battery thoroughly heated, the solution of the battery cells not rising to any appreciable temperature.

The manufacturer claims it to be a time saver for the service station handling a large battery trade, as a battery may be unsealed, inspected and the troubles diagnosed in a very short time and eliminating the chance of breakage.



The Hydrate Electric Battery Oven is a metal box open at the bottom, and containing in the upper portion of the box three electric heating units. The back of the box, by means of a bracket, is attached to an upright pipe standard on which it can slide, so that the height is readily adjustable to meet the height of any battery and is held in position by a thumb screw. There is also a stop which prevents the battery from coming in contact with the heating units. The oven is 21¾ inches long and nine inches wide inside, and is large enough for any standard starting, lighting and ignition battery.

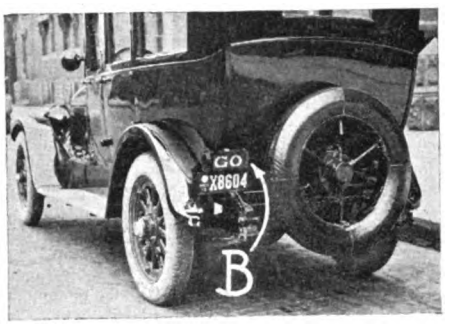
The heating units are designed for any 110 to 125-volt lighting circuit, either direct or alternating. The power required



is 1½ kilowatts, so that the cost of operation is low. The front of the oven is hinged and may be opened for examining the battery while it is being heated. The oven is shipped completely assembled, including the heating units and connecting cable ready for installation. The upright standard and the mounting block are drilled and screws and all parts furnished. The installation is accomplished in a few moments time.

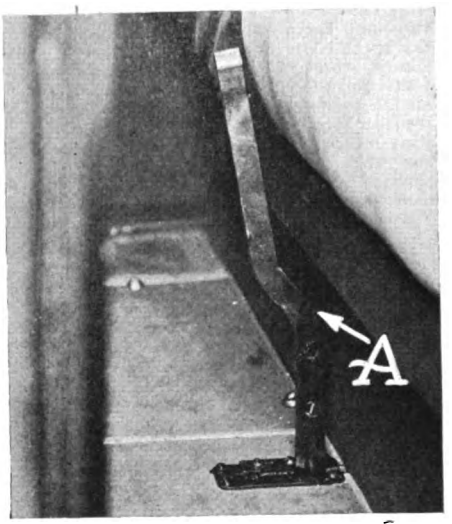
Manufactured by the Service Station Supply Co., Detroit, Mich. Price, $42.50.

The Auto Indicator Safety Signal is a rear signaling device known as the "Four-in-One Auto Indicator." It combines the signal and tail lamp in one instrument and is operated automatically, showing the arrows for turns and the words "Go" and "Stop." The housing at the rear of the car is enameled steel, nine inches long and 4½ inches wide. In this housing there is a longitudinal reel which revolves on bearings at the ends of the outside casing.



On the four sides of the reel are the words "Go" and "Stop," one arrow pointing to the right and another pointing to the left. When the brake is applied the word "Stop" appears and when the brake is released the indicator goes back to the neutral position, or "Go."

A small hand lever "A" is conveniently placed and a slight manipulation of it will make the arrow point in the direction the driver intends to go. This feature is especially attractive to operators of closed cars. The word "Go" shows red at night, making it an effective tail light, while any change in direction or change

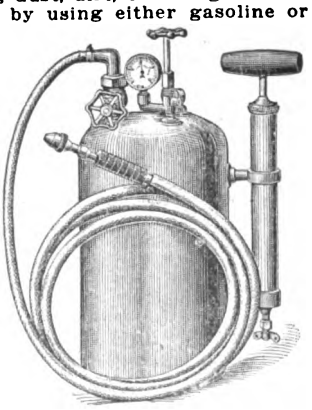


in signal is flashed in a white light. The indicator is placed over number plate "B." The housing is light and ornamental and the control is simple, durable and effective.

Some states make it compulsory for automobile owners and operators to equip their cars with a signaling device, and the manufacturer claims that this one has been approved by boards of examiners as complying with the law.

Manufactured by the Auto Indicator Co., 209-217 Ottawa Avenue, N. W., Grand Rapids, Mich. Price, retail, $15. Dealer and jobber trade solicited.

The Turner Engine Cleaner is for removing dust, dirt, oil and grease from the engine by using either gasoline or kero-



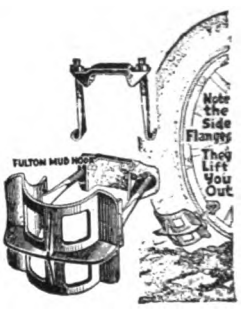
sene in a suitable container, forcing the gasoline or kerosene through a hose and small nozzle by air pressure, supplied either by a small hand pump attached to the side of the container or connected direct to the shop air pressure system.

The containers are made in three sizes, No. 1 of one quart, No. 2, two gallons, and No. 3, five gallons. No's. 2 and 3 are equipped with a valve, allowing connection to be made to the shop pressure system, a pressure gauge and a valve admitting the kerosene to the hose and nozzle. The containers are made of heavy seamless metal, having all joints acetylene welded and all connections, valves and nipples of brass, air tight. The air pressure gauge registers to 40 pounds.

Manufactured by the Turner Brass Works, Sycamore, Ill. Prices, No. 1, $5.20; No. 2, $22.60; No. 3, $26.40.

Fulton Mud Hooks for the motorist and truck operator are malleable castings that are fitted to the rim of the wheel and tire in case of emergency and give added traction to the wheel.

The mud hook is fastened to the rim by means of special bolts which have a hook at one end for holding the mud hooks, the other end being threaded and fastened by means of a clamp passing over the felloe



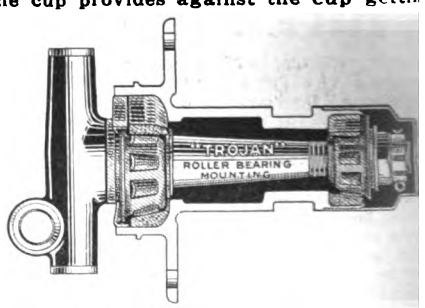
of the rim. Through this type of fastening the mud hook is rigidly held in place.

Two mud hooks constitute a set and they are of a size that may be conveniently carried in the tool box. It is stated that the mud hooks give traction enough in mud or snow to easily move the car.

Manufactured by the Fulton Co. 1910 St Paul Avenue, Milwaukee, Wis. Price, $ for set of two.

"Trojan" Tapered Roller Bearings fo Ford and Chevrolet Cars are designed o the same principle as tapered roller bear ings used in any high grade car. Whe disassembled the retainer holds the roll in place on the cone, making mountin easier and less liable to misadjustment, a well as preventing the loss of the rolls.

Trojan retainers are especially heav and are made from one piece of steel. Th cups and cones are extra heavy. As th metal supporting the cup in some hubs rather thin, this excessive thickness the cup provides against the cup gettin



out of round, when carrying its load, being forced to its position on the h The rolls have an excess carrying capac and are made of high grade alloy ste All "Trojan" bearings are guarante against imperfect workmanship and ma rial.

Manufactured by the Ahlberg Bear Co., 317-327 East 29th Street, Chica Prices and literature on application.

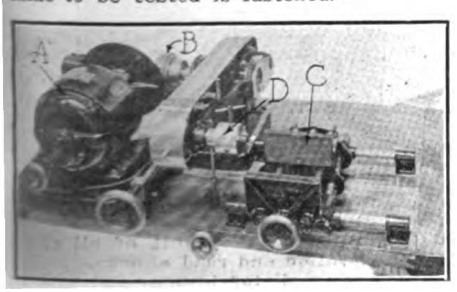
Cowie Testing Equipment for testing and repairing all makes of automotive electric equipment, consists of a shop bench containing the necessary apparatus, switches, ammeters, voltmeters, etc., for the testing of generators, motors and magnetos.

The bench legs are made of cast iron, which makes the bench more rigid and allows it to be bolted to the floor. The universal drive and holding device, which holds and drives any and all makes of automobile electrical devices for testing them under operating conditions, is shown at A in the illustration. The spark gap testing device is shown at B and the ammeters and voltmeters are shown at G and H. The magneto and coil test block are shown at C and the magnet recharger at E. A storage battery as source of current supply is shown at D and the adjustable clamps at F.

The Cowie universal drive and holding device is designed to hold and drive any or all makes of automobile electrical equipment, such as generators, dynamos, starting motors, magnetos, etc. A two-horsepower electrical motor (A) supplies the power and by means of a friction drive (B) the instrument to be tested can be operated at any desired speed. It also has a universal holding device (C), which is adjustable and will securely clamp the instrument being tested while it is being operated. There is also an adjustable check (D) in which the shaft of the machine to be tested is fastened.

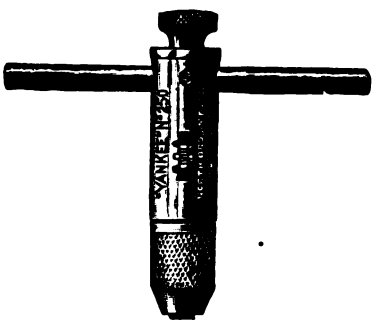


The armature and field coil test equipment consists of a standard growler to operate on 110 or 220 volts A. C. current, and is equipped with an ammeter and rheostat. The magnet charger has a magnetometer, which indicates in pounds the strength of any size magnet and will readily show whether it is in good condition or must be replaced. The coils of this device are wound so as to operate on a six or 12-volt battery.

The magneto and ignition coil test block has a cast iron cradle, which is connected to that point and will test any magneto, armature or ignition coil. The breaker is a standard Westinghouse vertical head, which carries the cam and platinum points. These are mounted on a block to fit the holding vise and are so connected as to make all test of ignition coils, either with or without the condenser connected.

Manufactured by The E. S. Cowie Electric Co., Kansas City, Mo., and Wichita, Kan. Prices and literature on application.

"Yankee" Ratchet Tap Wrench No. 250 is a universal tap wrench that will take taps in size up to and including 3/16 inch. The outside diameter of the wrench is ¾ inch and the length over all is 3¼ inches. A larger size, No. 251, takes taps up to and including 5/16 inch, having an outside diameter of chuck of ⅞ inch, with a

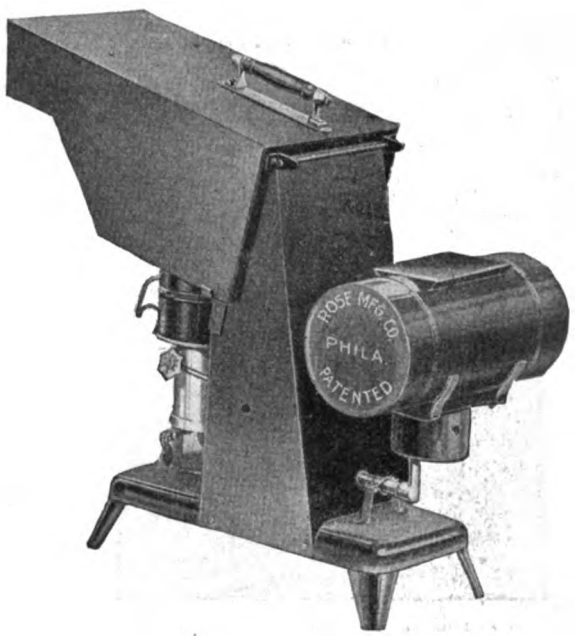


length over all of five inches. No. 1251 takes taps of the same size as No. 251 except that the length over all is 13 inches. This wrench is special for work in steel cars, etc., where the work is of an overhead nature where a long stock is required.

The distinguishing features of the Yankee ratchet wrench is its adaptability, convenience and efficiency for working in close quarters, corners and inaccessible places.

The ratchet mechanism is of the same construction as that used in other Yankee tools and allows the worker to use the wrench for either right or left hand work by simply sliding the pawl in the center of the handle from the top to the bottom of the slot or vice versa. The cross bar is held central by a friction device and is of ample leverage for larger taps than what the chuck will hold. A knurled thumb piece at the top of the wrench affords a ready means of starting in and backing out the tap quickly. For packing in the tool chest, the cross arm is readily removed, so that the wrench occupies but little space.

Manufactured by the North Bros. Manufacturing Co., Philadelphia. Prices on request.



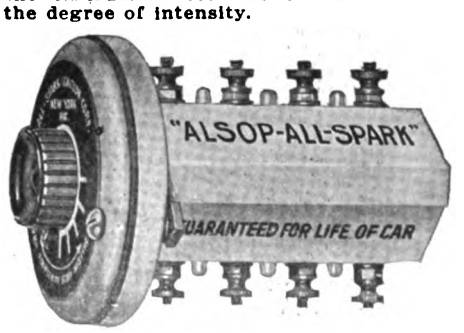
The Neverout Auto Radiator and Garage Heater is designed for the private garage. The base of the burner has a capacity of 1½ gallons and the heater will burn for 36 hours with one filling. The burner is screened, similar to a miners' safety lamp, and burns with an intense blue flame. Heat from the burner is carried upward and forward through a flue that allows the heat enter directly the front of the radiator, thoroughly warming the cooling medium and the units of the engine.

The manufacturer claims that this device after heating the radiator will allow enough heat to pass into the air to heat the garage enough so that a person may work in the garage with comfort. This device, with the safety screening method employed, has been approved by leading fire insurance companies, it is stated.

The extreme length of the heater is two feet, five inches; height, 26 inches; width, 12 inches, and weight, 19 pounds.

Manufactured by the Rose Manufacturing Co., Garage Heater Division, 910 Arch Street, Philadelphia. Price, $27.50, complete, express prepaid.

The "Alsop-All-Spark" is a spark intensifier that is placed on the dash of the car and has the high-tension wires from the coils attached to the terminals of the device. The current passes through the intensifier and, by means of terminals and high-tension cables, is led to the plugs. A knurled hard rubber button on the face of the instrument controls the device and the degree of intensity.



The maker claims that the "Alsop-All-Spark" will cause a plug to fire even under adverse conditions and that it has a tendency to correct many of the troubles that arise from too much oil in the base of the engine. Spark plugs that become fouled with oil or carbon, it is claimed, are cleaned by the higher intensity of the current.

Manufactured by the All-Spark Ignition Co., 13 Water Street, New York. Write for prices and literature.

The Presto-Felt Windshield Cleaner is a new article for the motorist and is designed by the manufacturer to keep a section of the windshield free from moisture, allowing the driver to see clearly.

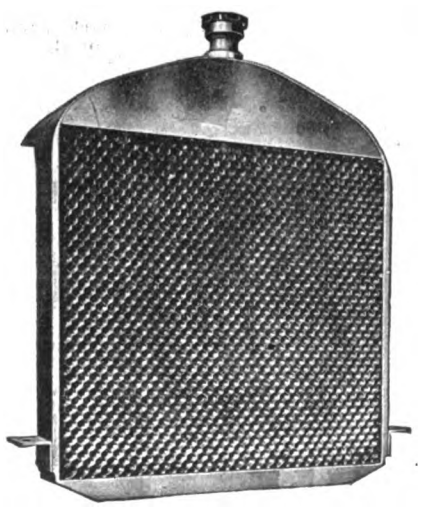
The Presto-Felt windshield cleaner is composed of two chemically treated pads of felt, held in place on the windshield by two springs, attached to the shield at the top and allowed to swing through an arc on the shield. While the Presto-Felt windshield cleaner is made in only one size, it is adaptable to all windshields, by means of a simple fastening clip at the top, tightened by a bolt and nut.

The chemical used in the felt pads is applied to the shield after moisture has collected on the glass of the shield. Swinging the cleaner across the shield allows the chemical from the pads to stick to the shield, and as moisture attempts to collect the drops of water are flattened out by coming in contact with the chemical, leaving the surface of the glass so treated clear for the operator to see through.

It is claimed that one treatment is sufficient for the duration of a storm and that both sides are cleaned at the one operation.

Manufactured by the Presto-Felt Manufacturing Co., Toledo, O. Price, $2 each.

The White Radiator for Ford Cars is a replacement radiator having a shell of the same type as the regular Ford radiator, but having a core constructed on different lines. The core of the White radiator is of the honeycomb type, made up of many sections or thin flat tubes, connected at the top and bottom to the tanks of the radiator and separated from each other by unusually large air spaces. The core is



made of a soft brass, having all joints sealed in high grade solder, making the core one solid unit.

It is claimed that the White radiator insures better cooling. The vertical air passages between the tubes allow sufficient expansion to help prevent bursting when the water freezes.

Manufactured by the F. H. Lawson Co., Cincinnati, O. Prices, Fords 1911-1916 inclusive, $27.50; 1917-1920 inclusive, $27.50.

Emco Truck Radiator (Ford Type) is a new radiator for replacement purposes on the Ford one-ton worm drive truck. The construction throughout is similar to that found in the larger and heavier motor trucks. The radiator is made in three sections and is easily disassembled in case of accidents or the replacement of tubes. The tubes are constructed of seamless drawn copper ⅝-inch diameter, 76 tubes being used. The tanks and frame are tough malleable castings, combining minimum weight with maximum ability to withstand vibration. Large vents at each side of the frame materially increase the circulation of air.

The top and bottom water tanks are detachable and, if repairs should be necessary, any tube can be removed and a new

one put in its place with a blow torch and a soldering iron. A leaky tube can be repaired merely by inserting a smaller tube inside the damaged one, or, on the road, the tube can be merely pinched out and repairs completed later. New fins and tubes may be purchased at nominal cost.

The manufacturer claims that the Emco Radiator is proof against freezing and that the water will not boil on account of the larger cooling capacity.

Manufactured by Motor Truck Radiator & Manufacturing Co., 2 Columbus Circle, New York. Price and literature on application. Quality guaranteed.

Carborundum Valve Grinding Compound in the handy combination can is a mixture of the hard, sharp, fast cutting carborundum grains and a high grade grease. It is made in coarse, medium and fine mixtures, and it quickly cuts the carbon, giving the valve a true, clean seat. The coarse or the medium compound is for

roughing in the valve and the fine for polishing the valve. The handy combination can carries both the fine and the coarse compound in separate compartments, and is ready for instant use.

It is also supplied to the garage and service station trade in one and five-pound cans. Either the coarse, medium or fine compound can be purchased in the cans.

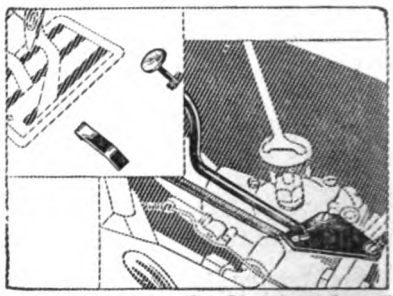
This grinding compound is particularly valuable in grinding valves, lapping pistons and rings and in all forms of grinding where a rapid grinding compound is

desired. It has the advantage of not becoming imbedded in the metal.

Manufactured by the Carborundum Co., Niagara Falls, N. Y. Prices, combination can for the motorist, No. 277, 50 cents; one-pound can, either grade, $1.25; five-pound can, either grade, $5.

The Sense Foot Accelerator for Ford Cars is an attachment that allows the Ford operator to feed gas to the engine independent of the hand throttle. The accelerator rod is so placed that it clears the magneto plug and the carburetor hot air intake pipe, attaching to the throttle valve by means of a special plate.

A chain connects from this plate to the end of the throttle rod, allowing the accelerator to be used independent of the throttle. A hole is drilled through the accelerator rod where it fits into the plate operating the throttle valve, and a cotter pin is inserted, so that the rod will not slip down, causing the rod to bind. A



rest is provided on the floor board so that operation of the accelerator is easy and free from jolts caused by passing over uneven ground.

It is said that the Sense accelerator will not bind after years of hard service and that the drivers' foot cannot come in contact with the accelerator when operating the foot pedals.

Manufactured by the C. H. Rice Co., Cherokee, Ia. Price, $1.50.

The Doric Radiator for Ford Cars is patterned somewhat after the Rolls-Royce type. Like the Rolls-Royce radiator, it embodies such features as a solid Liberty silver alloy finish instead of nickel.

The Doris radiator affords the Ford engine a larger cooling surface which, it is claimed, does away with the excessive heat, especially in the front seat of the car, keeps the engine at a nearer even temperature and allows the engine to develop more and better power. The method of suspension is novel in that the strain is taken from the casing of the radiator and is placed upon a strap fastened at the

bottom, relieving the shell of all strain due to vibration and road shocks.

The Doric radiator is provided with an extra tank, securing greatly increased water capacity and affording ample provision against emergencies. Large vents permit free circulation. A high grade hexagon core is used on account of its effective cooling and leak resisting qualities.

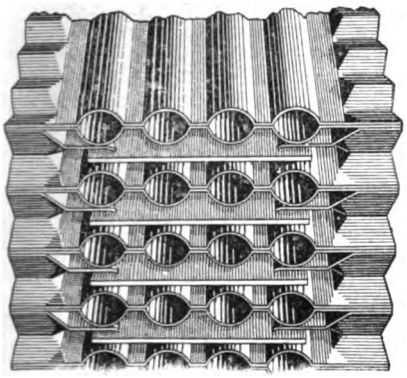
Manufactured by the Motor Truck Radiator & Manufacturing Co., 2 Columbus Circle, New York City. Price, $40. Immediate deliveries. Quality and efficiency guaranteed. Liberty Silver Shell to fit standard Ford core, price, $10.

Digitized by Google

Lober Non-Bursting Radiator for Ford Cars consists of a core constructed on the tube principle, having the tubes formed in sections 2⅜ inches thick and able to expand during freezing weather. The water circulation is allowed to pass through these tubes and the edges of the tubes are crimped so that the inrush of air may more readily pass. The radiator tubes are made of brass throughout and the manufacturer claims that the tubes will stand repeated freezings without damage.

As will be noticed from the illustration, the tubes are in sheets of four, separated at their centers by partitions, allowing the edges to come together, but when freezing takes place in the radiator the centers separate, allowing for expansion without damage. After the freezing has been overcome the center partitions contract, giving the core its original form.

The tubes are separated one from the other by metal partitions, fastened at the top and bottom of the core. Air passages are provided in and around the tubes by



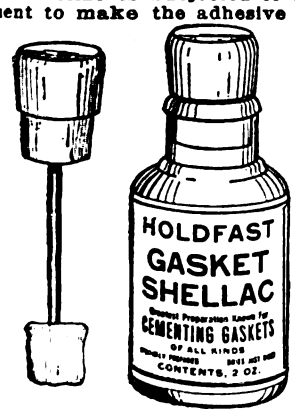
means of spacer partitions passing from the front to the back and forming the front and rear sections of the radiator.

In case of leaks, soldering is easily accomplished, as the depth of the soldering is only ¼ inch front and back. The core is 2⅜ inches thick. In assembling the radiator the parts are assembled and the core dipped in melted solder, making the core a solid unit.

The Lober Non-Bursting Core is guaranteed by the manufacturer to stand freezing and the company will repair or replace without charge any radiator damaged from freezing if returned to the factory, charges prepaid. It is also guaranteed to be made of the best of materials and workmanship.

Manufactured by the Lober Art Brass and Specialty Co., Toledo, O. Prices on application.

Holdfast Gasket Shellac is an adhesive compound used in replacing gaskets about the engine. It is furnished to the trade in two-ounce bottles, complete with swabber for applying the shellac. In preparing this shellac, the manufacturer states, the gum shellac is subjected to a special treatment to make the adhesive qualities

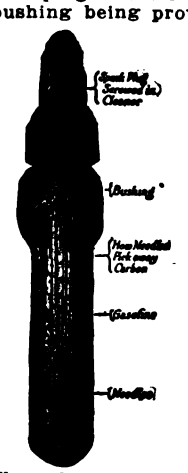


greater than they ordinarily would be.

Holdfast gasket shellac, it is claimed, is made from the highest grade of materials obtainable, and is of a thick bodied consistency, making it especially suitable for gasket work. Slow drying qualities predominate and it is said that this feature is desirable where permanent results are sought.

Manufactured by the Buffalo Specialty Co., 375 Ellicott Street, Buffalo, N. Y. Prices on request.

Champion "Minute" Spark Plug Cleaner is a small device, originated by the manufacturer of the Champion spark plug, for the easy cleaning of spark plugs, especially plugs of the non-separable type. The spark plug cleaner is screwed to the threads of the plug at the end of the shell, a rubber bushing being provided for this



purpose. The tube is six inches long and is made of heavy moulded glass, one end of which is open. Inside the tube are 50 hardened loose steel needles that serve as the carbon removers.

To clean a plug the tube is first half filled with gasoline or, better still, a like amount of Johnsons' Carbon Remover. The Johnson product is superior to gasoline in that it is made specially for the purpose of removing carbon deposits. The plug is then screwed into the shell and the tube shaken up and down for a minute or two. The action of the needles loosens the carbon, while the liquid washes it away and dissolves the accumulation of carbon.

Manufactured by the Champion Spark Plug Co., Toledo, O. Prices on request.

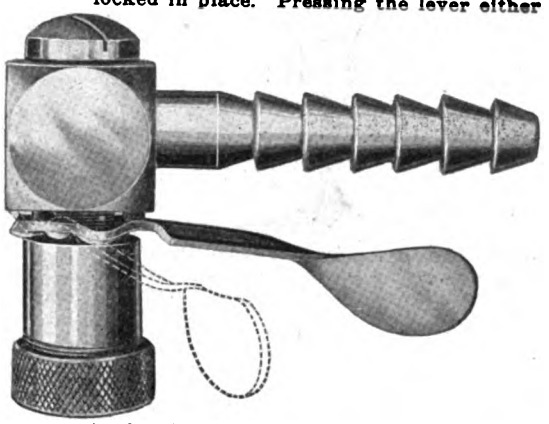
The "Exytite" Tire Chain Adjuster may be attached to ordinary tire chains in place of the regulation chain fastener. The manufacturer claims that this device will overcome the trouble of having a fastener come loose and the loss of a chain; that

it is easily hooked or unhooked by the driver without injuring the hands or fingers, and that it may be unhooked without the use of tools.

The device consists of a heavy steel wire, rust proofed body with a clamping and locking lever, on which is pivoted a connecting piece with eyelet for fastening adjuster to tire chains. Made only in one size and this size is adapted to all chains for passenger cars. Chains can be made tight or loose as desired. The hook locks the chain and the clamping lever locks the hook. Sold by jobbing houses or may be purchased direct from the manufacturer.

Manufactured by the Exytite Sales Co., 82 Church St., New Haven, Conn. Price, $1.50 for set of four.

The "Lox-On" Air Hose Chuck or air hose connection does not depend upon a rubber washer to grip the tire valve stem, but slips over the valve stem and by means of the lever the chuck is firmly locked in place. Pressing the lever either



to the right or left accomplishes this locking effect and once locked the device is sure to allow all of the air from the source of supply to enter the tire.

Manufactured by the Automatic Safety Tire Valve Corporation, 1765 Broadway, New York. Price, $3.

Pronto Fire Extinguisher is a new product and, as its name implies, is a quick acting agent in case of a fire caused from gasoline, naphtha, kerosene, etc. It is an extinguisher of small size that may be carried in the automobile or truck or

may be used in the factory.

The Pronto consists of a 16-ounce container, a crown sealer cap, an upper and lower patented bracket and the actual fire extinguishing liquid The device is installed in brackets and attached to the wall, door or other convenient place. When fire breaks out the extinguisher is simply pulled from the brackets and the contents dashed into the base of the fire. The sealer cap automatically comes off as the extinguisher leaves the brackets.

The maker states that the liquid, which is carbon tetrachloride, is the most powerful fire extinguishing agent known. Instead of drenching fire as does water, this liquid, upon contact with fire, forms a heavy non-inflammable gas that spreads like a blanket over the base of the flames, drives off oxygen and thus chokes the fire. It is said to be the most effective liquid known for gasoline, oil and other hazardous fires and, because it is a "dry" liquid, it is a non-conductor and is safe and unusually effective to use on electrical fires.

Manufactured by the Allen Corporation, 546 Greenwich Street, New York City. Price, $1.50 each, six for $8.50. Literature on request.

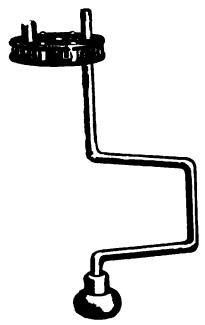
Sidel-Ruttner Folding Wonder Pump is of the collapsible type. It is easily taken apart and folded, taking little space in the tool box. The base is of malleable iron, the handle of hard wood removable, and the piston has an air tight assembly with a cold rolled steel plunger rod. The cylinder is made of heavy gauge steel, japanned and baked, black with all brass finishings lacquered. The pump has a positive check valve in the base, insuring a positive flow of air to the tube when pumping. The pump is also fitted with a suitable length of hose and connection to the tube valve. A brass cap having a knurled edge, facilitating removal, is fitted to the top of the pump cylinder, through which the plunger rod works.

Dimensions when folded are 21 by 2¼ inches by two inches over all. The weight is 2¾ pounds. Packed one in box, 25 in a shipping case.

Manufactured by the Sidel-Ruttner Manufacturing Co., Inc., 31 Broadway, Brooklyn, N. Y. Price, $3; west of the Rockies, $3.20.

The Universal Off-Set Speed Wrench for Ford Cars removes the connecting rod nuts of the crankshaft very easily and is especially useful in reaching and turning the fourth connecting rod nuts in the Ford crankcase.

The wrench is made of steel, having three cut gears, hardened socket and heavy brace. It is strong and durable. The offset is 4¾ inches long, having a three-inch distance between socket and

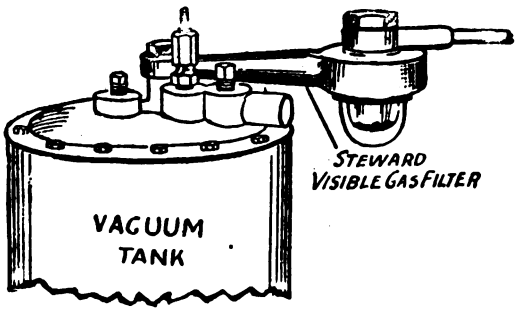


brace rod. This allows ample distance to place the wrench in the crankcase and have the socket fit up directly on the nut of the fourth connecting rods of the crankshaft. The brace is one-half inch steel rod with a 10-inch swing, giving sufficient leverage to remove the tightest nuts. The wrench is 17 inches over all and weighs four pounds.

Manufactured by Sawyer Sales Co., Terminal Building, Lincoln, Neb. Price, $5.

The Stewart Visible Gas Filter is attached to the main fuel pipe of cars equipped with the Stewart vacuum feed tank. The work of the filter is to separate the sediment and water that accumulates in the main tank from the gasoline before it reaches the vacuum tank.

The filter consists of a cast arm, fastened to the intake of the vacuum tank and the fuel pipe by suitable connections. A glass bowl is provided at the filter,



through which the gasoline flows from the fuel pipe. Sediment and water, being heavier than the gasoline, settle to the bottom of the glass bowl, while the gasoline passes up and through a fine mesh screen and on into the vacuum tank. The bowl is easily accessible for cleaning and may be removed by unscrewing a retaining bushing at the top of the bowl. Gaskets are provided above and below the bowl, making the device air and gas tight.

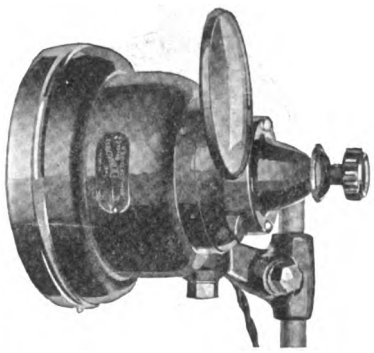
The gas filter is easily attached by any one handy with tools and once in place will show sediment as it collects. The sediment may be removed as occasion warrants. The manufacturer states that the filter will eliminate many of the troubles due to sediment and water or lint in the gasoline feed line and will result in a smooth, quiet operating engine.

Manufactured by the Automotive Material Co., Chicago. Price, $5.50.

The Red Spot Searchlight combines a powerful white light with a red light that can be changed from white to red or red to white by pulling out or pushing in a button at the rear of the lamp.

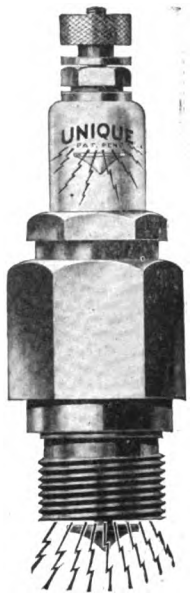
The searchlight is attached to the windshield, is hinged to a swivel bracket so that it may be swung to varying positions, and carries at its top a mirror that is also attached to a swivel arm.

A knurled button on the back of the lamp controls the flow of current, while a smaller button controls the change from white to red. The lamp is renewed from



the back, without disturbing the front of the lamp, by removing two small screws, allowing the lamp assembly to be completely removed. This saves the reflector from being scratched and also saves springing the front of the lamp. Brackets are furnished for practically any make of car for 75 cents.

Manufactured by the F. W. Wakefield Brass Co., Vermilion, O. Price, $5.



The Unique Deflector Spark Plug consists of three sections and two gaskets and is constructed on the separable principle. The maker states that the shell of the plug is made of high grade steel and the porcelain is made of finest grade. The gaskets are copper asbestos and are claimed to be gas tight. The bushing at the top of the shell is made of brass and fits into the shell threads. Gaskets placed above and below the shoulder of the porcelain and with the threaded bushing form a gas tight fitting.

The main center electrode passes from end to end of the porcelain insulator and has at its lower end a disc formed integral with the electrode. The manufacturer claims that this disc provides a circular firing area of 360 degrees, insuring a circle of sparks. It is further claimed that the use of the Unique plug insures a thorough ignition of the charge and that the missing of the cylinders is done away with. A thinner mixture may be used and the maximum power maintained.

Manufactured by the Norris Co., 332 S. La Salle Street, Chicago. Prices, ⅛ or ¾ inch, $1.25.

West's Automobile Top Dressing is prepared especially for rubber, leather, pantisote and all artificial leathers. The maker states that it has a good body, flows evenly and is made to stand the hard usage of an automobile top. The maker also claims that it restores the original

finish to tops and upholstery. It is jet black. A special advantage is that it dries over night.

Another product of the same company is the Mohair Top Dressing, which is for cloth goods, such as mohair and cravenette. This is recommended for cushions and backs. Both products are put in gallons, half gallons, quarts and pints, 12 to the case, and also in half pints, 24 to the case.

Made by L. M. West's Sons, 230 Broadway, Rockford, Ill. Write for prices and literature.

Home-Made Lever Press.

HOME-MADE LEVER PRESS.

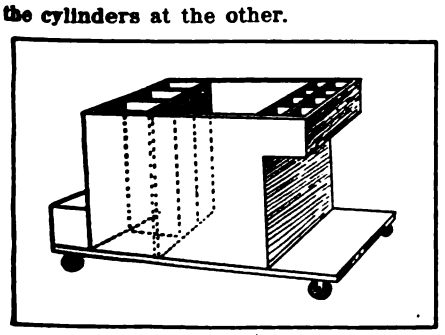
A handy lever press for a small repair shop is made as follows: Secure a length of street car rail from a junk dealer and a short piece of shaft. A heavy plank bench should be built with stout legs that may be fastened to the floor. Brackets are made from four-inch iron, heated in a forge and bent at right angle. Four holes are drilled in the end of the iron for fastening to the bench and a single hole drilled in the other end for the short shaft.

Two brackets will be needed, one at each side. A bearing is made from a strip of iron, shaped to the shaft, by heating in the forge. Holes are drilled at each end to attach it to the rail, and corresponding holes drilled in the rail.

The device is assembled as shown in the cut, using a screw jack of small size for gaining the leverage. The work is raised or lowered by using blocks of different heights and it has been found that this device will take care of practically all of the work that will come to the small shop, such as pressing off gears, pulleys, etc.

TRAVELING PARTS BOX.

"A place for everything and everything in its place" is most important when overhauling the car, and this idea can best be carried out by providing a box with suitable compartments and mounted on casters. The box shown in the illustration has a space in the center for large units such as wheels, radiators, axle housings and the like. There is a series of compartments for small parts, and spaces for larger units, such as axle shafts and steering gear parts. The pistons and rods are carried at one end and the cylinders at the other.



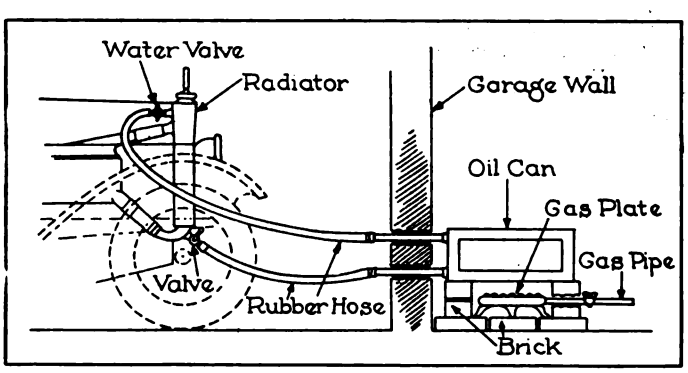
Traveling Parts Box.

GAS HEATER FOR THE GARAGE.

A novel gas heater for a garage recently brought to the writer's attention is so simple in construction, and the owner declared it intensely practical, that it is given to Journal readers for what it is worth.

The outfit consists of a small box or house close to the rear of a garage in which an ovenlike structure of fire brick was placed on the ground to surround a burner, raised to clear the ground. A four-inch gas burner was placed in the center of the oven and connected through a shut off valve to the gas supply of the house lighting system. Over the burner was placed a two-gallon gasoline or oil can, setting on the brick sides of the oven and clearing the burner three or four inches. Two ⅜-inch pipes were run from the side of the can through the wall of the garage, one pipe above the other. The pipes were coupled to the can by soldering on it brass nipples.

In the garage rubber tubing, ½ inch bore, lead from the pipes to the radiator of a car, the lower tubing connected to the drain out petcock and the upper tube



Gas Heater for Garage.

is carried in an easy curve to a petcock soldered at the top of the radiator inside.

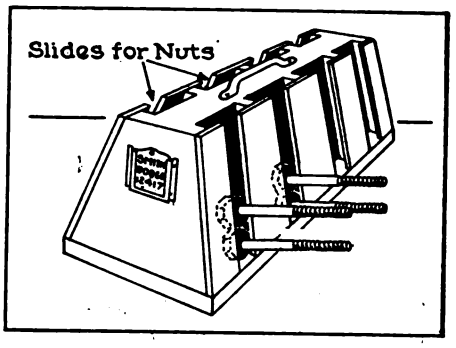
When the car is run into the garage at night the lengths of hose are connected at the top and bottom of the radiator, the petcocks opened and the gas lighted at the burner. The water will heat in the tank and a circulation will be started through the radiator that will keep the water warm and the car ready for use at a moment's notice.

The dimensions of the parts used may be of interest, and are as follows: Gas ring, four inches diameter; gasoline or oil tank, two gallons (heating tank); iron pipe, ⅜ inch; hose pipe, ½ inch; gas taps of ordinary brass pattern, ⅜ inch clear bore.

The heating effect is easily under control and the only care necessary is to see that the tank of the radiator is kept full, and that the upper pipe slopes gradually upwards, and does not sag anywhere, otherwise air or steam locks may stop circulation.

NUT AND BOLT RACK.

A unique device for holding nuts and bolts removed from an engine during overhauling is made from a wooden block somewhat wider at the bottom than at



Nut and Bolt Rack.

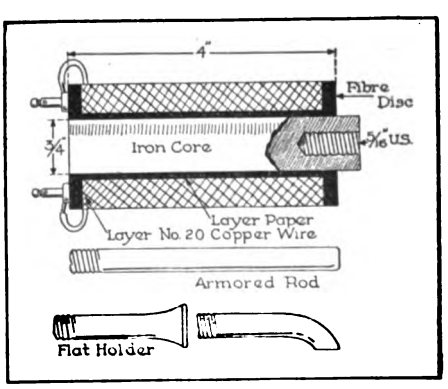
the top, and about 18 inches long, although the length may be varied to suit the individual needs. Slots are cut in the sides of varying widths to take various sizes of nuts and bolts and strips of either light wood or strips of metal were screwed to the slots, partially covering them. Space is left between the strips for the insertion of bolts and nuts. The grooves will be T shape and the head of the bolts are inserted in the grooves with the ends sticking out.

The bottom of the block is covered with a section of board so that the nuts and bolts are retained in the grooves. A small clip or card holder is attached at the end, showing the repairer's name, the car worked on and the job number. Several of these blocks will be required in a garage doing considerable repair work, so that the nuts and bolts of each job may be kept separate.

A handle is attached to the top of block for carrying about the shop.

PICK-UP-MAGNET.

A magnet is handy to remove iron and steel parts from places inaccessible with the hand, especially an electric magnet, because of its greater attraction. In the magnet illustrated a ¾-inch soft iron core four inches long is wound with six layers of No. 20 cotton covered wire. The terminals are brought out at one end and at the other there is a 5/16-inch tapped hole for the insertion of various types of rods to aid in reaching out-of-the-way corners. A six-volt storage battery may be used as the source of current supply. Be certain the rods used for the handles are insulated.



Pick-Up Magnet.

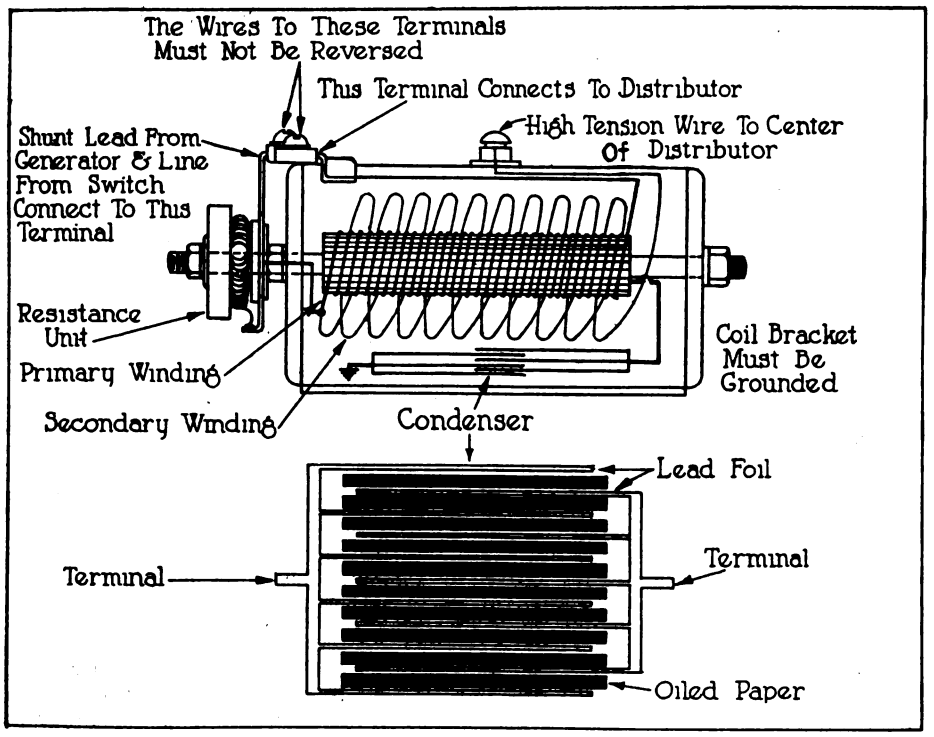
Explaining the Condenser and Manner of Testing It



Sectional View of Delco Coil and Condenser, Showing in Detail the Construction of a Condenser and the Connections of the Condenser in Relation to the Coil.

THE condenser is found connected across contact points of breaker mechanism. Its use is to prevent the contact points from burning and pitting and to assist the coil to increase the voltage in the secondary windings.

In construction it comprises strips of tinfoil, insulated from each other by oiled paper. Half of these tinfoil strips are connected to one terminal and half to the opposite terminal. Current cannot flow through the condenser, but the condenser has the property of absorbing a certain amount of electricity and building up the voltage.

Defective condensers not only cause the points to pit rapidly, but also cause the ignition system to work poorly, or, more likely, not at all. A test of the condenser is therefore necessary.

Testing Apparatus.

The testing apparatus consists of a 16-candlepower carbon lamp connected to a 110-volt direct current line. The condenser is connected to the two leads and the ends of the wire snapped together. If the resulting spark is hot, fat and cracks with a good sharp report, the condenser is all right. If this does not happen, junk the condenser and purchase a new one.

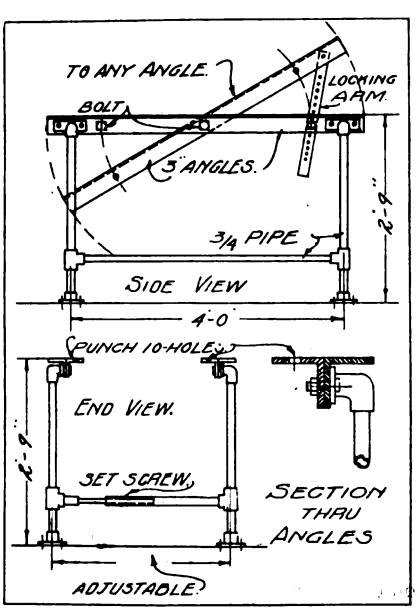
This test may be made with alternating current, with 110 volts, in the same manner. The test is, however, a little more difficult. By trying the alternating current test a few times on a condenser known to be defective and one known to be right, the repairer will be able to use the alternating current satisfactorily.

The testing outfit described for the condenser test will be found invaluable in making all sorts of electrical tests, for short circuits, grounds and open circuits.

HOME-MADE ENGINE STAND.

An engine stand that may be made in a few hours time by any mechanic or garage repairer from water pipe and four lengths of angle steel will prove as serviceable for use as any stand that may be purchased, and it is constructed in such a manner that any size engine may be handled upon it and the work done from many angles.

The stand is constructed from three-quarter or one-inch gas or water pipe and the necessary fittings for the uprights and cross members. Floor flanges being used at the tops and bottoms of the uprights for the stand to rest on at the floor and the angle iron lengths are fastened to the tops of the uprights. The height of the stand is 33 inches from the floor, which brings the engine to about the proper height for the repairer to work. This height may be varied in building the stand to convenience the repairer, but 33 inches has been found to be the average height required.



The four angle iron members are about four feet six inches length and as will be seen from the diagram, two are bolted together to form a side. Holes are bored in the ends of the inside angle iron strip so that engines having base or arm holes in different locations may be bolted to the angle iron bed and held securely. Most any size bolt may be slipped through the holes while work is done upon the engine, so long as they hold securely. The stand is made wider or narrower by adjusting the cross members at the ends. A set screw is fitted to the longer length of pipe and is seated against a short steel or iron rod fastened securely by welding or otherwise to the short length of pipe extending from the fitting in the upright. This rod is such a length that quite a range of adjustment is obtained, so the stand may be used for varying width of bases.

With this stand by removing the end bolts in the angle iron bed the engine and stand may be tilted to any angle desired for work. This is possible as the center bolts allow the inside angle strips to turn free from the outer strips and when turned are held in any position by a strap fastened to one of the end bolts, having a series of holes drilled in it, spaced an equal distance apart. The edges of the angle iron strips should be beveled so that the repairer will not catch his clothes and tear them.

With a little forethought a nice piece of work can be made in constructing a stand of this type and considering the small cost for the material and the labor of assembling will more than repay the shop owner building it.

All of the pipe and fittings are threaded and are used without any change. The four fittings at the tops of the uprights, to which are secured the angle iron strips, are the same as are used for the feet of the uprights. These may be purchased at any plumber's supply house and are known as flanges. The only difference in them is that when used at the tops the sides are ground off, leaving a strip about two inches wide with two holes for fastening them to the angle iron members. The bolts used should fit flush inside of the angle iron and the holes for the bolts should be countersunk to have flat surfaces for the inside angle iron members to pass without binding.

LOCKING COTTER PIN.

By filing off the sides of a cotter pin to make a small catch on the end it is possible to make a locking pin. The shank of the pin should be sprung apart before inserting in the opening, and the ends will catch after the pin is pushed into the opening. This device will prove very handy where it is desirable to lock the cotter pin permanently.

RECORD OF BUILDING OPERATIONS FOR NOVEMBER

Contracts Made and Plans Contemplated for Alterations or Erection of Garages, Repair Shops, Service Stations and New Plants.

CONTEMPLATED PLANS AND SPECIFICATIONS.

Birmingham, Ala.; Archbald-Goldstein Motors Co.; one-story garage, 75x90.

Gadsden, Ala.; Vaughn Garage Co.; one-story garage, 50x150.

Phoenix, Ariz.; C. E. Tucker; one-story garage; $7000.

Little Rock, Ark.; E. M. Rowe Auto Co.; one-story garage, 40x50.

Chico, Cal.; Allen & Davidson; one-story salesroom and service station; $50,000.

Eureka, Cal.; D. E. Frazier and W. L. Frederick; one-story garage; $7000.

Fresno, Cal.; Bottoms-Williams Motor Co.; one-story garage; $40,000.

Los Angeles, Cal.; A. M. Eckard; one-story garage, 50x150.

Pasadena, Cal.; Marshall & Custer; one-story garage, 50x200.

Santa Ana, Cal.; Orange County Garage Co.; one-story garage, 100x117.

San Diego, Cal.; James E. Collumb; one-story garage, 150x200.

San Pedro, Cal.; F. D. Foote; one-story garage; $15,000.

New Haven, Conn.; N. B. Whited; one-story garage, 60x220.

Washington, D. C.; H. B. Boyle, care H. A. Stout, Guarantee Trust building, Atlantic City, N. J.; two-story brick and steel public garage, 40x144, at 14 and 16 F street, S. E.; $30,000.

Fort Lauderdale, Fla.; W. M. Bivens; one-story garage, 50x60.

Americus, Ga.; G. Tuipiu; two-story brick garage, 41x83; ornamental front; $25,000.

Atlanta, Ga.; C. W. McClure; one-story garage; $40,000.

Forsyth, Ga.; Forsyth Auto Co.; one-story garage; $20,000.

Macon, Ga.; Kingman, Moore & Franklin; one-story garage, 55x210.

Macon, Ga.; Goldman; one-story garage, 60x135.

Savannah, Ga.; T. A. Bryson; one-story garage, 120x157.

Boise, Ida.; Sharman Auto Co.; one-story garage, 75x125; $30.000.

Rupert, Ida.; Bailey Brothers; one-story garage, 50x100.

Chicago, Ill.; J. J. Novy, 2434 S. Ridgeway avenue; one-story garage and show room, 75x125, at Ogden and Central Park avenue; $16,000.

Chicago, Ill.; J. L. McConnell, 105 W. Monroe street; one-story public garage, 50x125, 2646 Lawrence avenue; $20,000.

Chicago, Ill.; Kuther Brothers; one-story garage, 81x157, at 1130 W. Harrison street; $25,000.

Chicago, Ill.; Samuel Rosenbloom; one-story garage, 50x122; $30,000.

Chicago, Ill.; Joseph Dargulzis, 632 W. 18th street; one-story private garage, 26x51, at 18th and Ruble streets; $60,000.

Chicago, Ill.; Bird & Sykes, 2215 S. Michigan avenue; three-story garage and auto show room, 62x160, at 2210 S. Michigan avenue; $75,000.

Chicago, Ill.; Emil Krant, 3800 N. Hoyne avenue; one-story garage and machine shop, 75x100, on Claybourn avenue, south, North avenue.

Chicago, Ill.; Leslie Hughes, 4628 West Washington boulevard; one-story garage and show room, 50x90.

Chicago, Ill.; Robinson Garage Co., Inc., 6011 Rhodes avenue; one-story garage, 39x226, at 67th and Dorchester avenue.

Chicago, Ill.; Joseph Zidek, 4021 W. North avenue; one-story garage, 80x125; $25,000.

Chicago, Ill.; John Klucina, 1932 S. 57th street, Cicero, Ill.; one-story (Ford) service station, 30x100; $25,000.

Chicago, Ill.; E. J. Ohrenstein, 58 W. Washington street; one-story garage 25x100; $3500.

Chicago, Ill.; Charles Johnson, care Z. E. Smith, 305 E. 55th street; one-story garage, 75x140; Wentworth avenue, near 66th street; $25,000.

Decatur, Ill.; Oliver Brust; one-story garage, 80x110; $700.

Henry, Ill.; C. M. Lucas, 2½-story brick and hollow tile garage, 60x60; $15,000.

Joliet, Ill.; Buick Motor Car Corp.; one-story garage, 50x175.

Joliet, Ill.; Spaugler Motor Co., 614 E. Jefferson street; two-story brick and reinforced concrete garage, 50x76, tar and gravel roof; $20,000.

Robinson, Ill.; A. L. Maxwell; one-story garage and sales room; $40,000.

Clinton, Ind.; J. M. Vietti; one-story garage, 55x158.

East Chicago, Ind.; J. Hartley; one-story garage and machine shop, 78x100; $20,000.

Hammond, Ind.; John Schmuesser; one-story garage, 50x136; $22,000.

Indianapolis, Ind.; Charles E. Bacon, 11th floor, I. O. O. F. building; two-story brick and concrete garage, sales room and service station, 50x165; $20,000.

Indianapolis, Ind.; Alfred Hoberg; one-story garage, 40x195; $15,000.

Indianapolis, Ind.; Frank Hatfield Co., 533 N. Capital avenue; three-story garage and sales room at 623-27 N. Capital avenue; $150,000.

Lafayette, Ind.; Lee Van Reed, Williamsport, Ind.; two-story auto salesroom and service station, 80x180, at Seventh and Main streets; $50,000.

New Castle, Ind.; Charles Minnick; one-story garage, 82x122.

Oakland City, Ind.; Hurst & Lemanster; one-story garage and service station, 80x150; $20,000.

Wabash, Ind.; L. A. Babe; one-story garage and sales room, 66x132.

Whiteland, Ind.; Dault Whittaker; one-story garage, 60x80.

Des Moines, Ia.; Kruiderier-Cadillac Co.; one-story garage, 85x169.

Des Moines, Ia.; William Knudson & Son; two-story garage and sales room, 66x105; for Harry Sgeeu, 911 S. & L. building; $60,000.

Dubuque, Ia.; Standard Oil Co.; two-story garage and paint shop, 90x100; $50,000.

Sioux City, Ia.; Harry Longnecker; one-story garage; $40,000.

Storm Lake, Ia.; Universal Motor Co.; one-story garage and sales room, 66x132; $15,000.

Truesdale, Ia.; Ream Peterson, Alto, Ia.; one-story garage and sales room, 59x100; for Edward Spooner; $14,000.

Wapello, Ia.; Marshall Auto Co.; one-story garage, 80x80; $10,000.

Arkansas City, Kan.; Rae E. Hudson; one-story garage, 50x132; $10,000.

Arkansas City, Kan.; S. A. Waldschmidt; two-story brick and stone garage, 50x131, at 608 S. Summitt street; $15,000.

Hollywood, Kan.; G. L. Baker & Son; one-story garage, 70x130; $25,000.

Kansas City, Kan.; E. Drier & Son, 949 Armstrong avenue; two-story garage, 50x130, at 430-32 Minnesota avenue, for J. Shapiro, 1427 Commerce building; $20,000. Lessee, Buick Motor Car Co., Admiral boulevard and Harrison street.

Modesha, Kan.; Nevdesha Motor Co.; one-story garage, 100x140.

Wichita, Kan.; J. E. Petrie; two-story garage, 50x140, at Main and English streets; $30,000.

Ashland, Ky.; J. H. McCleary; two-story brick garage, 50x95; $10,000.

Bowling Green, Ky.; Davidson Brothers; one-story garage, 50x50, at 10th and Adams streets; $10,000.

Hardin, Ky.; Ross & Lentz; one-story garage; $10,000.

Lebanon, Ky.; T. M. Estes; one-story garage, 125x150; $60,000.

Louisville, Ky.; Kentucky-Indiana Motor Truck Co.; one-story garage and sales room, 50x180; $40,000.

Louisville, Ky.; Roy E. Warner & Co.; one-story garage, 50x200; $75,000.

Louisville, Ky.; K. M. Lobied, 1471 S. 18th street; one-story garage and service station, 54x125, at 18th and Hill streets; $20,000.

Louisville, Ky.; Embrey & Weir, 507 E. Broadway; two-story garage and display room, 60x200, at 845 S. Third street; $60,000.

New Orleans, La.; Lyons-Barton Co.; one-story garage; $50,000.

Patten, Me.; Ira D. Carpenter; two-story garage, 66x120; $20,000.

Baltimore, Md.; John Bridge; one-story garage, 150x500.

Baltimore, Md.; H. S. Delaney; two-story garage, 30x35.

OVERSIZE TIRE TABLES.

Oversize tires, designed primarily for exceptional and hard service, have come into general favor among owners of medium and large capacity passenger cars, because of their extra strength, easier riding and longer mileage that may be expected from them. They are popular also because in the opinion of many owners they add to the appearance of the car.

Some users of oversize tires think that a tire with increased cross section diameter, but with no increase of diameter measured through the hub from outer edge to outer edge of tire, is an oversize. This is a mistake. In other words, if the regular size tire is 34x4, the oversize is not 34x4½, but 35x4½. Both diameters must be increased or the bead will be strained in putting the tire on the rim.

Firestone gives the following table to show the proper regular and oversize tire for a given rim:

Rim	Regular Tire	Oversize Tire
28x3	28x3	29x3½
30x3	30x3	31x3½
30x3½	30x3½	31x4
32x3½	32x3½	33x4
32x4	32x4	33x4½
34x4	34x4	35x4½
32x4½	32x4½	33x5
34x4½	34x4½	35x5
36x4½	36x4½	37x5

The government standard oversize scale, which has been adopted by tire manufacturers, sets a maximum and minimum air capacity for each oversize. The table given above applies to those tires which, like Firestones, give the maximum of air capacity for each oversize.

WHITE COMPANY TO VOTE ON INCREASE.

The directors of the White Motor Co., Cleveland, O., have called a meeting of stockholders for Dec. 12 to vote on an increase of capital stock from $20,000,000 to $25,000,000.

The regular quarterly dividend of $1 a share, payable to stockholders of record Dec. 15, has been declared.

GOODYEAR COMPANY INCREASES STOCK.

The Goodyear Tire & Rubber Co., Akron, O., has increased its capital from $100,000,000 to $200,000,000.

INCREASE IN STUDEBAKER EARNINGS.

Not long ago President Erskine of the Studebaker Corporation, South Bend, Ind., stated that that concern was in stronger financial condition than ever before and that its cash in bank, sight drafts outstanding and investments in government and marketable securities totaled nearly $15,000,000. This is within $8,000,000 of Studebaker's net working capital as of the close of last year and compares with $4,652,126 representing its cash and investments as of Dec. 31 last. At that time the company's current assets totaled $36,944,571 and its total current liabilities were $14,127,549, leaving net working capital of $22,817,022.

The phenomenal growth in the earnings of the Studebaker Corporation over the past three months is revealed in the fact that net earnings after all charges and taxes in the third quarter of this year were equal to the net earnings of the first and second quarters combined. Report for the third quarter shows net earnings of $3,300,000, or $11 a share on the common after all charges and allowances for federal taxes. For the nine months ended Sept. 30 net earnings after all charges and taxes allowance were $6,600,000, or $22 a share on the common.

It is expected that total production for this year will exceed 40,000 cars. The company's additional plants at South Bend will be completed by January next and by April shipments of cars should be well under way. The schedule of production for 1920 calls for 25,000 cars from the South Bend plants and 50,000 from Detroit, which it is estimated will place Studebaker's sales well over $100,000,000.

LOCKPORT CO. TO MAKE AUTOMOBILE GEARS.

Arthur H. Dittmer, formerly of Detroit, Mich., who recently resigned as director of production and purchases of the Covert Gear Co., is reported to have closed a deal whereby he becomes owner of the old Mansfield Glass Co. property at Green and Grand streets, Lockport, N. Y. The consideration is said to have been about $7000.

Mr. Dittmer is organizing a company, capitalization of which will be $150,000, to make gears for automobiles. The company will erect a large plant on the property bought by Mr. Dittmer. At the outset, it is proposed to employ upwards of 150 men. This number will be increased to 400, according to Mr. Dittmer.

HAMILTON TIRE & RUBBER CO. ORGANIZED.

The organization of the Hamilton Tire & Rubber Co., under the laws of Michigan has been announced. All the directors are Detroit business men and the officers are: President, Andrew J. Little; vice president, Manuel Munoz; secretary, Edward A. Crowther.

Mr. Munoz, an expert in the manufacture and sale of tires and accessories, resigned from a position in New York to come to this new company and will have an active interest in its management. The capital is $50,000.

VOLUNTARILY INCREASES PAY OF WORKMEN.

The Hoffman Brothers Motor Works, Elkhart, Ind., has voluntarily increased the pay of its 68 workmen 10 per cent.

When the new addition to the factory is completed 25 men will be added to the force.

The annual pay roll is now $150,000.

WAR STORY OF THE RED CROSS.

Following is the war story of the American Red Cross told in round numbers:

Contributions received (material and money), $400,000,000; Red Cross members: Adults, 20,000,000; children, 11,000,000, 31,000,000; Red Cross workers, 8,100,000; relief articles produced by volunteer workers 371,577,000; families of soldiers aided by home service in United States, 500,000; refreshments served by canteen workers in United States, 40,000,000; nurses enrolled for service with army, navy or Red Cross, 23,822; kinds of comfort articles distributed to soldiers and sailors in United States, 2700; knitted articles given to soldiers and sailors in United States, 10,900,000; tons of relief supplies shipped overseas, 101,000; foreign countries in which Red Cross operated, 25; patient days for soldiers and sailors in Red Cross hospitals in France, 1,155,000; French hospitals given material aid, 3780; splints supplied American soldiers, 294,000; gallons of nitrous oxide and oxygen furnished French hospitals in France, 4,340,000; soldiers served by Red Cross canteens in France, 15,376,000; civilian refugees aided in France, 1,726,000; American convalescent soldiers attending Red Cross movies in France, 3,110,000; wounded soldiers carried by Red Cross ambulances in Italy, 148,000; children cared for by Red Cross in Italy, 155,000.

The New Jersey Automobile Trade Association at a recent meeting passed resolutions, through its board of trustees, extending its heartiest congratulations to its former president, George E. Blakeslee of Jersey City for the successful conclusion of his efforts as campaign manager for Edward I. Edwards, who has just been elected governor of New Jersey. It was also resolved that it is the earnest wish of the association that the aims of both Mr. Blakeslee and Governor-elect Edwards for an adequate and complete system of hard surfaced highways such as will once more place New Jersey within the ranks of good road states be fulfilled.

How a dealers' association may prove of great value to its members is indicated by the following action taken at a recent meeting of the Louisiana-Mississippi Automotive Trade Association:

Adopted standard form sales contract.

Authorized employment of strong legal counsel to solve knotty problems for members.

Movement started against fraudulent advertising.

Began plans to clean up the business by eliminating curbstone and dishonest dealers.

Received real suggestions for solution of used car problem.

Made plans for energetic campaign along many lines for the benefit of the industry and the investigation of many complaints.

A Warehousing Corporation is being organized at Pittsburgh, Pa., to erect a fireproof storage house on the site of the former Luna park recreation resort, which will be used by automobile dealers. The building will be six stories and have 500,000 feet of floor space, with sidings from two railroads. The estimated cost of site and building is given as $900,000.

The Portland Garage and Repairmen's Association of Portland, Ore., is soon to have a venison banquet. This association now has nearly 200 members and is adding to this every day.

The Motor Car Dealers' Association of Los Angeles, Cal., was incorporated in December, 1909, the incorporators being Ralph Hamlin, A. M. Young, Earl C. Anthony, William E. Bush, Don Lee, J. S. Conwell and Robert Atkinson. A few years previous to the formation of this association several of the leading dealers of Los Angeles affiliated as "The Licensed Dealers' association," for the purpose of holding automobile shows, race meets, etc. The Los Angeles association has always prided itself in being connected with affairs worth while and always loaned a hand to all real racing events such as the Los Angeles to Phoenix and Santa Monica road races, and the Altadena, Box Springs and Redlands hill climbing contests. One of its real accomplishments has been its many well conducted and most successful automobile shows. The memberhip today includes 54 of the prominent dealers of Los Angeles, who all believe in joining any good sport that is vital to the sustaining of the interests of the industry, but the association is devoting its chief endeavors at the present time along legislative lines. It is loaning its support in behalf of the National Highway movement and is also affiliated with the National Motor Car Dealers' association. It is felt that such an association as this is one of the main spokes in the wheel towards bringing about state and national legislation that will help to put the automobile business on a sound footing and bring to end for all time the hazards that exist through legislation that affect and might destroy the automobile business. Last, but not least, it is considered that the benefit of a dealers' association is to enable the members to get better acquainted with their competitors, and that if this is practised the whole automobile industry will get on a business basis more quickly than by any other method. The present president of the association, Ralph Hamlin, is now holding the office for a second time, his first term being the year it was incorporated. The other officials are: Vice president, F. S. Albertson; treasurer, L. V. Starr; secretary, H. J. Coger; attorney and assistant secretary, Dave F. Smith; other directors, P. H. Greer, H. L. Arnold, Earle C. Anthony. Mr. Greer is a director from the Los Angeles association to the National Dealers' association.

The Automobile Business Association of Grand Rapids, Mich., adopted its constitution and by laws May 15, 1919. It is a social and beneficial organization formed for the purpose of its members becoming better acquainted and cooperating with each other for the betterment of trade purposes and methods, the dissemination of valuable and useful information, to oppose hostile and procure the enforcement of just laws and ordinances and to eliminate all forms of graft and subscription lists, and to further the development of the automobile industry; also to improve trade relations and methods by pointing out and endeavoring to correct trade abuses and to gather information for the purpose of establishing a credit bureau by accurately compiling the credit rating of customers of the members of the association, and furnishing to members a copy of the list so compiled. The fee for admission is $150 and the yearly dues are $25. Any individual, copartnership or corporation is eligible to active membership which is engaged in any or all lines of automobile or kindred business in Grand Rapids and vicinity. The association holds a show at the western Michigan fair in September of each year and also another in February, both of which have proved to be successes financially and otherwise. Through these shows the association is able to pay the expenses of the organization and to refund the members anywhere from 50 to 95 per cent. of the money they put into the show in purchasing space. The present officers are: President, W. K. Philp; vice president, G. A. Beelby; treasurer, J. A. Abfalter; secretary, M. D. Elgin; directors, W. L. Peiter, B. W. Olin, R. E. Becker, A. Gezon, P. M. Hutchings, C. P. Palmer.

A State Trade Association is being agitated for the State of Oregon, it being pointed out that there are many matters, action on which would be of value to automobile dealers generally all over the state which cannot be secured in the absence of such a state organization. This includes legislation, roads and highways, laws regarding car thievery, protection to tourist and motorist from unscrupulous repairmen, trade discounts on parts, tire discounts, etc.

The Rubber Workers' Club of Portland, Ore., has affiliated with the Portland Garage and Repairmen's association.

Automotive MOSCO Equipment

BEAMOLITE SPOTLIGHT

The spotlight that sells at sight. Distinctive and an ornament on any car. Made for owners who seek the greatest utility and service.

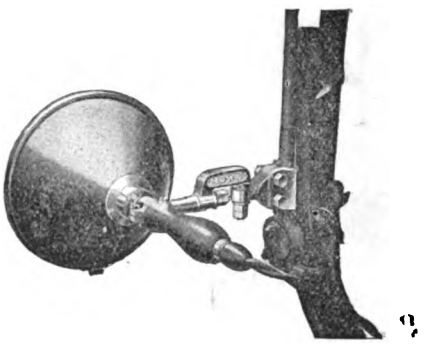
The bracket is of Universal type, made from non-rusting metal, heavily nickel plated and so designed and made that it "stays put" in any position.

The reflector is made of brass, silver plated, on nickel and highly finished. It affords maxmium lighting effect, and can be thrown in any direction (even backward).

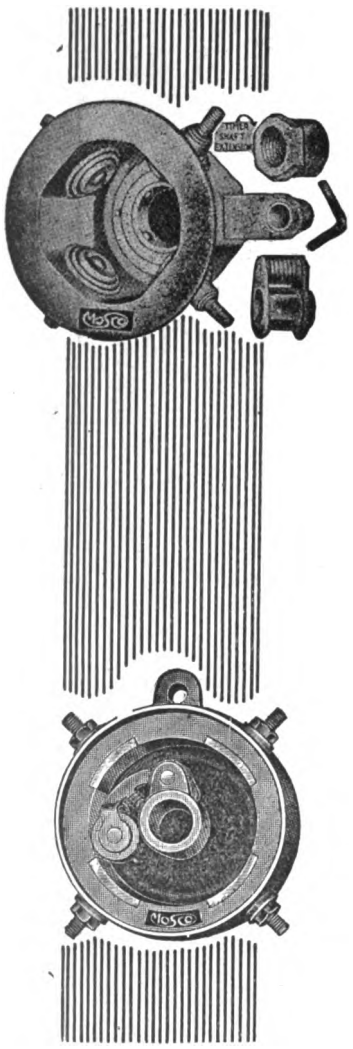
The focussing adjustment is simple and positive. The switch is of the lasting and practical type, and operated by a turn of the handle. The one convenient and safe switch in emergency use. The switch being placed inside of the handle, cannot be effected by water, dirt or weather.

It can be easily and quickly removed from the bracket when there is need of a trouble lamp. The bulb can be quickly replaced by removing the rim screw.

The Beamolite is custom made, quality equipment. Strongly constructed, giving a powerful light and so refined in appearance that it lends dignity to any car. All metal parts are heavily nickel plated, aside from the outside of the reflector, which is finished in two coats, black enamel baked on.



PRICE WITH 12 FT. HEAVY DUPLEX CLOTH COVERED CABLE, $15.00.



IMPROVED BEMUS BALL CONTACT TIMER FOR FORD CAR

The BEMUS is the IDEAL TIMER for the FORD high speed, short stroke engine, because form of contact is the only one which is correct both electrically and mechanically. This is made of a hardened tool-steel brush coming in contact with steel balls which are kept in proper position by means of a spring with plug on the end pressing against them. The impact of the brush causes the balls to turn so that a fresh surface is presented for each contact.

The brush comes in contact only with the four balls, touching no fibre or insulation. This is a decided improvement over the ordinary type timer, where the roller is constantly wearing grooves in fibre ring which holds contacts. The balls are so located that each has a track of its own on the brush, this insuring a maximum amount of wear.

MOUNTING is direct on the time shaft by means of an extension piece which is screw threaded on to shaft, and runs in ball-bearing placed in recess of Timer's shell. This means that each of the balls is equi-distant from the brush. RESULT—absolute precision of timing. Easier starting, smoother running, longer life and saves coil points.

EASIER STARTING—The chief cause of starting trouble in the Ford car is the presence of a body of hardened oil on the flat contact segments of the ordinary type timer, which prevents passage of current from the brush until continued turning has scraped off the grease. In the BEMUS the use of balls for contacts eliminates this source of trouble, as but little oil is used and the balls cannot retain more than the slightest film on their surfaces. Made of Heavy Nickel Plated.

PRICE, $3.00.

MOSCO No. 200 TIMER FOR FORD CAR

The case is made of extra heavy pressed steel, finished in aluminum. Gray bone fiber is used for raceway, with steel inserts dovetailed in. The threaded terminals are insulated by fibre washers all the way through to contact points, thus removing cause of short circuiting.

A timer universally used. Demanded wherever Ford cars are used. While sold at a low price, it affords dependable service and in efficiency is in keeping with all Mosco products. This Timer can be recommended and sold with a service guarantee that will satisfy any purchaser.

PRICE, $1.50.

Send for the Mosco 1920 catalogue and discount sheets. The full line of Mosco specialties is shown. A postal will bring a copy.

FRONT APRON FOR FORD CARS

For 1917-18-19-20 Models Only.

This apron makes a wonderful improvement in the appearance of the Ford Car, and for that reason alone is worth the cost, but it does more than that.

IT PREVENTS MUD FROM CLOGGING RADIATOR.
ITS SHAPE INDUCES A LARGER VOLUME OF AIR TO PASS THROUGH RADIATOR AND REDUCES RISK OF OVERHEATING.
IT KEEPS LAMPS CLEAN.
IT PREVENTS VIBRATION OF MUD GUARDS.

Made of heavy steel, finished with two coats black enamel and baked. Furished complete with bolts, nuts and washers. Easy to attach.

PRICE, $6.50 EACH. $7.50 WEST OF MISSISSIPPI RIVER.

THE MOSCO VALVE GRINDER

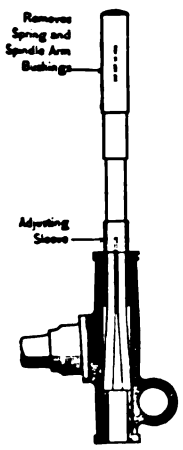
It renders valve grinding an accurate mechanical operation rather than a guesswork hand job.

It has been found that a much more rapid motion can be obtained with the Mosco Grinder than with the ordinary tool, resulting in a very superior finish on the seats.

It is guaranteed in every respect. It is offered not only as a tool, but as a QUICKER, SAFER and BETTER METHOD of valve grinding.

PRICE, $2.00.

MOSCO JIFFY BUSHING REMOVER



For Ford, Dodge, Dort, Chevrolet, Saxon, Overland and all Cars, Trucks and Tractors having ½" spindle bolt.

Made of steel, case hardened.

Indispensable to repairman and owner who does his own work.

Pays for itself in a few minutes.

The only tool now in use that will remove steering knuckle, spindle arm and spring bushings.

PRICE, $1.50.

"TUWAY" COMBINATION DASH LAMP AND PLUG SOCKET

The "TUWAY" dash lamp affords a combination of refinement and utility which places it in a class by itself. Its pleasing design makes it an ornament to any car, and this design has the added advantage of giving a greater distribution of light from the same candle power bulb than any other lamp made. In addition it has the exclusive feature of a socket into which to plug trouble lamp, cigar lighter, etc., without interfering in any way with the light of dash lamp. The switch is very conveniently placed in the lamp bracket.

The Tuway is made of brass heavily nickel plated and comes complete with bulb and all necessary screws, bolts and nuts for attaching to either wood or metal dash. This is a superior quality item, a sure seller and much in demand.

PRICE, $2.50 EACH.

MOSCO FLOATING PLUNGER WHEEL PULLER

Starts a "Frozen" or "Stuck" wheel instantly. Strike the plunger, turn the screw, strike again and the wheel comes off without injury to hub threads, spokes or axle.

Made for 200 models of 45 popular makes of cars.

JOBBERS AND DEALERS—

The 1920 line of Mosco Specialties includes only items that are known and used by owners wherever cars are sold. Your orders should be placed promptly. The Mosco National Advertising Campaign is now in full swing. Aside from constant sales, good margins and satisfied customers, there are other reasons why you should stock the full Mosco line. Full information at request.

TIRE INDUSTRY AND TRADE

IDEAL TIRE AND RUBBER LETS NEW PLANT CONTRACT.

The Ideal Tire & Rubber Co., through D. C. Hathaway, general sales manager, announces that ground has been broken for a large addition to its present plant. Contracts amounting to $6,250,000 are already on hand, and it has become imperative that this new unit be rushed to completion. The Ideal plant is now running three eight-hour shifts and employs about 450 men.

"Our present splendidly appointed factory with modern equipment and floor space of about 65,000 feet," said Mr. Hathaway, "is now turning out approximately 1000 tires and 800 tubes per day. We have on contract for the coming year 48 large distributors, in addition to having a wide distribution of dealers, making it necessary to increase our production capacity to at least 2000 hand made tires per day.

"As a step toward service to our distributors and dealers, we have recently perfected the Greyhound cord tire, into which has been built all the efficiency, quality and skill that have earned for the Greyhound fabric tires their great popularity. The Greyhound cord tire with its new tread designed to skillfully hold the road, is a marvel in super size and construction and is indeed the ideal of all cord tires."

Tire dealers throughout the country are now handling Greyhound tires and a large export trade has already been secured through C. O. Brandes, export manager.

The Smith Rubber and Tire Co., Inc., Passaic, N. J., has broken ground for a large tire plant, to be located at Garfield, N. J., 10 miles from New York city, where it will manufacture only cord tires, the same being an invention of Fred W. Smith, Rutherford, N. Y. The company announces that it expects to sell to the automobile owner a cord tire for the price for which is now paid for fabric tires. The directors are: Mayor John H. McGuire, Passaic, N. J.; Winfield Clearwater, president of the Secaucus National Bank, Secaucus, N. J.; Thomas A. Hopkins, Passaic; Dudley Gordon, Passaic, and Fred W. Smith, Rutherford.

The Lee Rubber Tire Co. has decided to increase the number of shares outstanding from 100,000 to 150,000. Of the new stock 40,000 shares have been underwritten by New York investment bankers and will be offered to stockholders at $33 per share. The amount realized from the sale of this stock will increase the company's working capital by $1,500,000, wipe out the indebtedness to banks, provide funds for construction and add several hundred thousands of dollars to the cash assets. The remaining 10,000 shares will be offered to employees under a profit sharing plan.

The American Tire Association, operating a large wholesale agency, has decided to open headquarters in Memphis, Tenn. S. Maurice Cohn and Max I. Cohn, both of Chicago, are the proprietors. The firm will have 10 men travel throughout the South, and may erect a factory in Memphis.

The G. E. Blaylock Tire and Rubber Co., Baltimore, Md., has been incorporated with $750,000 capitalization. The incorporators are G. E. Blaylock, A. G. Blaylock and Clarence C. Erdman. The new company is the outgrowth of G. E. Blaylock, Inc.

The F. L. Wiswall Tire Co., Boston, has been incorporated with $50,000 capitalization by Frank L. Wiswall, Clifton S. Wiswall and David J. Malone.

The Goodyear Tire & Rubber Co. announces that Douglas Fairbanks has ordered the first set of Goodyear cord tires to be built at the California plant of the company. "Doug" wrote a letter to F. A. Seiberling, president of the Goodyear company, congratulating him on his selection of California as the location of the

new factory. "Your foresight and industrial vision and the commanding position your company holds in the business world," he wrote, "have a tremendous influence upon the prosperity and development of this part of our country, which we all love so much."

The St. Louis Tire Dealers' Association has been organized with these officers: President, Joseph Roberts; vice president, Maurice Altheimer; treasurer, E. G. Hefter; secretary, Robert E. Lee; sergeant-at-arms, Arthur Fishell; directors, Joseph Sacks, Art B. Mooney, I. Reifier and J. P. Hartmann. Dues will be $25 annually for active members and $15 for tire manufacturers represented at St. Louis, who may be associate members. There are approximately 125 tire dealers in the city.

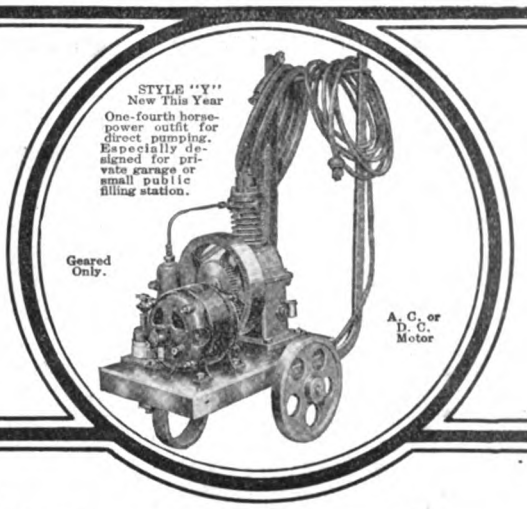
FREE
CURTIS AIR
FREE FROM OIL

The Curtis Sign is 10x14 inches —baked enamel on steel. Furnished FREE with every Curtis Garage Air Compressor—can not be had in any other way.



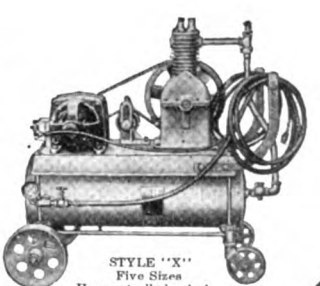
Curtis Free Air Service Brings You New Patrons and Increased Profits

It is generally recognized that compressed air to fill tires frequently carries oil and that this oil has a deteriorating effect on inner tubes. For this reason motorists are discriminating in their use of "free air service"—and are on the lookout for the Curtis sign because they know that Curtis Air is free from oil. It may be that the installation of the CURTIS outfit will be the beginning of a new era of profit-making for you.

Curtis Air—Free From Oil

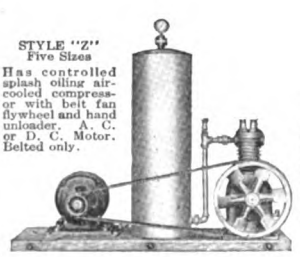
Curtis Air Compressors, through a patented construction, prevent oil from getting into the air line—therefore the air delivered is clean, pure and free from oil. The many other exclusive points of superiority, together with the simplicity, sturdiness and dependability of Curtis Compressors make them the popular choice everywhere. With the two new outfits illustrated—Style "Y" and Style "Z"—the Curtis line is now complete, offering a suitable compressor to meet every requirement. Ask your jobber or write us for illustrated literature describing the different sizes and types of outfits.

CURTIS PNEUMATIC MACHINERY CO.
1621 Kienlen Avenue St. Louis, Missouri
Branch Office: 531-A Hudson Terminal, New York City



STYLE "X"
Five Sizes
Has controlled splash oiling air-cooled compressor, with belt fan flywheel or with cut flywheel gear. A. C. or D. C. motor. Belted or geared.

STYLE "Z"
Five Sizes
Has controlled splash oiling air-cooled compressor with belt fan flywheel and hand unloader. A. C. or D. C. Motor. Belted only.



STYLE "Y"
New This Year
Five Sizes
Has controlled splash oiling air-cooled compressor, with belt fan flywheel or with cut flywheel gear. A. C. or D. C. motor. Belted or geared.

RAPID GROWTH OF GASTINE CO.

The story of the discovery of the principle involved in Gastine, the product now being manufactured by the Gastine Co., Bridgeton, N. J., and its subsequent development by I. W. Goldberg, the general manager of the company, is an unusual one.

Mr. Goldberg, who had previously been graduated at the West Jersey Military academy and had matriculated at Jefferson Medical college, on the day before his appointment for appearance before the dean of that college in Philadelphia, conceived the idea which he afterwards developed into the product which is now being marketed as Gastine. Mr. Goldberg's experience with automobiles, on which he was constantly at work, together with his previous years of the study of chemistry and physics, were a great help in his experiments. Like all owners of automobiles a few years ago, Mr. Goldberg found it was sometimes a job of almost half an hour to get his car started in the morning, and this imbued him with the thought that there should certainly be some sort of chemical or mixture which, combined with gasoline, would obviate this trouble. He commenced his experiments with the low grades of gasoline which were in use at that time, and they continued until 1915, when Gastine was perfected and put on the market in a local way.

He found motorists skeptical of the claims made for it and some even thought it would prove injurious, and it was an up-hill fight to get Gastine into the hands of the consumer at first. But as he was convinced of the merits of his discovery, Mr. Goldberg was undaunted and persisted in his efforts to gain recognition for it, until now he is in a position, with an efficient corps of assistants, to supply the demands of a market that has been increasing very rapidly for the past two years.

The officials of the Gastine Co. consist of the following: General manager, I. W. Goldberg; field manager, Gordon Patterson; heads of advertising department, P. S. Foster and Roger Thompson Butts; head of export department, Frederick J. Werner.

Foreign branches are being opened in London, England, Buenos Aires, Argentina, Australia and Paris, France, as well as in Montreal, Quebec.

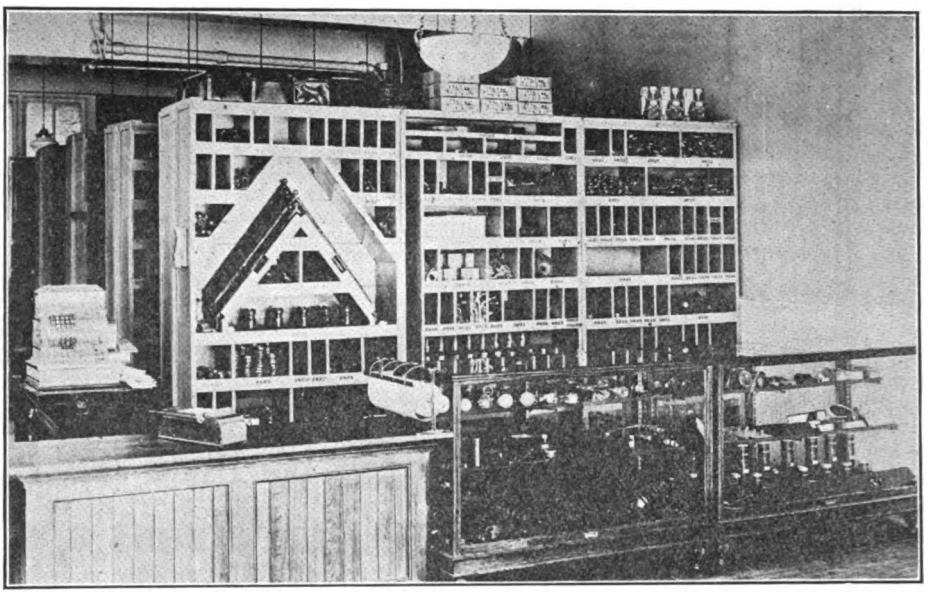
The company is now negotiating for the construction of a new plant at Bridgeton, which will give it adequate manufacturing and office facilities.

EMPLOYEES TAKE $7,000,000.

President F. A. Seiberling of the Goodyear Tire & Rubber Co., Akron, O., announced at a meeting of the stockholders of that company that 17,011 employees had subscribed for $7,000,000 of the new issue of $40,000,000 preferred stock.

The stockholders at the meeting approved a proposal to increase the capital stock of the company to $200,000,000, half common and half preferred. Only $40,000,000 of the preferred stock is to be issued at present.

Steere-Kitson Servistock System for Ford Parts



Ford Parts Department, Motor Sales Co., New Bedford, Mass., Showing Steere Servistock System.

THE very latest device for saving time and labor in the Ford service station is the Steere Servistock system, designed by H. A. Steere of the Steere-Kitson Co., Detroit, by whom it is manufactured.

The Steere idea is to have all the parts stored in units numerically arranged, following the Ford parts list, each number having a bin by itself. The bins are built in proportion to the size of the part and quantity of parts required for a month's business.

The use of this system will enable the employment of less expert help in the stock room, because the stock clerk need not necessarily know the difference between a stud and a bolt, yet if he can read numbers he can fill a stock order. The units are arranged so as to minimize the walking distance in filling an order. For instance, take the filling of a parts order on a rear axle job, which is one of the most common: These parts would come in adjacent units which carry the complete rear axle assembly, and would be located near the shop service window. The units carrying parts for less common jobs are placed correspondingly further away.

The system is primarily a time saving proposition for Ford dealers, in speeding up work on the floor and handing out parts over the counter as well as in ordering from the factory and taking parts inventory. The units themselves make a very attractive appearance in the stock room, giving it an efficient, business-like atmosphere.

The Steere Servistock parts system is merchandized exclusively through the Fairbanks Co., New York. These units are shipped ready to put into stock, each one being a complete cabinet in itself, substantially constructed and attractively finished in dado gray, with the numbers stenciled in black unless otherwise specified. The standard 12-unit system, having a $5000 stock capacity, is quoted at $425 f. o. b. Detroit; the 28-unit system, with $25,000 capacity, $695; the 42-unit system, with $50,000 capacity, $1125.

NEW MOTOR IN $1,000,000 PLANT.

The Twin-Energy Motors has been incorporated at Albany, N. Y., and will build a $1,000,000 plant for the manufacture of a new type of heavy oil motor by William H. Schneider, an automotive engineer formerly in the employ of the Ford Motor Co.

Plans are being drawn for a plant with a floor area of five acres to be erected at North Albany, and it will be three stories in height and will employ 250 hands.

The Twin-Energy motor has on tests developed a greater mileage to a gallon of gasoline, it is claimed, than any motor now on the market, almost doubling the efficiency of the engine. A novel feature of construction is that the automobile motor comprises only 16 moving parts, as against more than 100 in some other motors. The stationary type has only six moving parts. The engine will be manufactured in automobile, stationary, aircraft, tractor, truck and marine types.

Mr. Schneider, the inventor, has lived in Albany for eight years. During the war he served in the radio laboratories. The certificate of incorporation named Mr. Schneider, Oscar L. Perrault and Harold T. Cooper as the principal stockholders, and the directors named were Lawrence L. Perrault, Stephen V. Ryan, A. V. Clement and J. Howard Proper, all of Albany.

IOWA LEADS IN MOTOR VEHICLES.

Iowa still leads the United States in the number of motor cars owned there in proportion to the population. About one machine to every seven persons is the ratio there.

NEW FIRE EXTINGUISHER CO.

Harrison H. Boyce of the Moto-Meter Co., Inc., Long Island City, N. Y., has formed the Boyce-Veeder Corporation, having its factory and office in Long Island City, for making and marketing of an automatic and hand operating fire extinguisher especially applicable to motor cars, trucks, tractors, aeroplanes and other automotive vehicles.

The new company will operate under the Erwin patent. Associated with Mr. Boyce will be Paul L. Veeder, an attorney well known in both New York and Chicago, and also James A. Abeles, former vice president and general manager of the Motor Car Equipment Co., and more recently organizer of an eastern concern representing Beckley-Ralston Co. of Chicago.

Offices have been opened in the Queen's Subway building, Long Island City, and it is stated that production will be in full swing by Jan. 1. Mr. Boyce plans to divide his time between the new organization and the Moto-Meter Co.

NO CHANGE IN GARFORD.

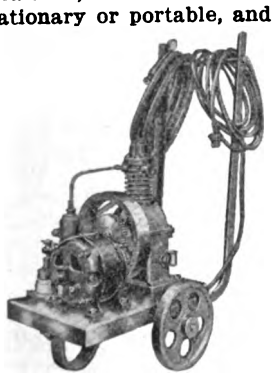
The Garford Motor Truck Co., Lima, O., states that the rumor that has been circulated to the effect that John N. Willys of the Willys-Overland Co., has acquired a controlling interest in the Garford company, is without foundation. The Garford company advises that neither Mr. Willys nor the Willys-Overland Co. is financially interested in that company.

The statement continues that on Jan. 13, 1915, the interests of the Willys-Overland Co. and all other interests in the Garford plant were purchased by the present Garford organization, since which time the present management has been in charge. The Garford Motor Truck Co. states that it is an independent corporation and has no affiliation with any other automobile or motor truck interests.

PORTABLE CURTIS COMPRESSOR.

The latest addition to the line of compressors, manufactured by the Curtis Pneumatic Machinery Co., St. Louis, Mo., is the style Y, ¼ horsepower outfit, especially designed for private garages or small garages and filling stations.

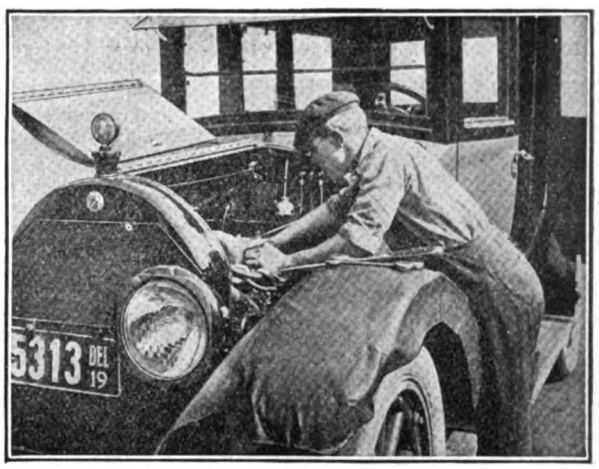
The style Y outfit has the controlled splash oiling system, and many other exclusive Curtis features, and can be furnished either stationary or portable, and comes geared only. This outfit is not intended for continuous duty or pumping into a tank, but is a special purpose machine, convenient and inexpensive, at the same time dependable.



The Timken Detroit Axle Co.'s issue of $5,000,000 preferred stock is offered to investors at 100 and accrued dividends.

NEW COVERING WHICH PROTECTS FENDER DURING REPAIRS

PROPRIETORS of garages, the opinions of many car owners notwithstanding, do not like to be called upon to make frequent embarrassing apologies for scratching, marring and otherwise blemishing of the varnish on their fenders, hoods and car bodies while undergoing repairs in their shops.



New Fender Protector for Use While Car Is Undergoing Repairs in Garage.

The accompanying illustration shows what a new fender protector looks like. It is made of a leather substitute consisting of a strong cotton fabric base coated with pyroxylin "dope." It has a pocket along the outside edge into which the edge of the fender is inserted. A flap on the cover runs down on the inside in such a way that the fender is entirely covered while the mechanic is leaning over it to work inside the hood. Thus the buttons on his clothing cannot scratch the varnish, nor is any harm done if he drops a tool or lays it down on the fender.

ROEDDING SIGNAL TAIL LIGHT,

It is well understood that a majority of rear end collisions of motor cars are due to the inability of the driver of the machine in front to clearly tell the driver of a car following just what he intends to do. The method of signalling by the extended arm is confusing, and sometimes the driver of the front car is compelled to apply the emergency brake and to bring his car to a sudden stop without being able to take his hands from the steering wheel. The result is that the driver behind has no warning and consequently has no chance to avoid a collision and possible injury to himself and the occupants of his car.

One of the newest automobile accessories is designed to eliminate this danger. It is the Roedding signal tail light, which is manufactured by the Grand Rapids Brass Co., Grand Rapids, Mich. This flashes the proper signal in large, clear, unmistakable letters, whether it is stop, left, right or back, on a plate, 10 inches by 3½ inches, on the rear of the machine. A 2½-inch disc, attached to the steering wheel, controls all signals, and without taking his hands from the steering wheel the driver can make his intentions immediately understood from the rear and can also give his undivided attention to the roadway ahead.

The Roedding signal operates by electricity from battery or cells. It is water proof, dust proof and fool proof and can be quickly installed to any make of car. When the car is moving forward the red light only shows.

BAY STATE PUMP REMOVES.

The Bay State Pump Co., Boston, Mass., has moved to 564 East First street, South Boston, Mass., King terminal.

BETLEHEM MOTORS DEALERS AND DISTRIBUTORS.

The Bethlehem Motors Corporation, Allentown, Pa., appointed the following distributors and dealers in October:

Distributors—J. M. Hutton, 753 West Jackson boulevard, Chicago; A. H. Koenicke, 718 Texas avenue, Houston, Tex.; Roemer Motor Car Co., Huntington, W. Va.; C. E. Morse, Marianna, Fla.; Hemming Wagon Works Co., Meridian, Miss.; Manypenny-Scott Motor Co., 908 North Broad street, Philadelphia; T. E. Knowlton, Syracuse, N. Y.; City Garage, Tupelo, Miss.

Dealers—Farm Power Machinery Co., 550 East Main street, Rochester, N. Y.; John Pembroke, Monticello, Ill.; Nelson Brothers-Strom Sales Co., Racine, Wis.; Dray's Auto Exchange, Chilicothe, O.; F. D. Hawke, Waynesville, O.; Morse-Lymen Auto Sales Co., Flint, Mich.; Auto Sales Co., Greenville, Miss.; S. H. Heavrin & J. J. Trefz, Owensboro, Ky.; Sandlin Supply Co., Richmond, Ky.; Dykes Hardware & Furniture Co., Delhi, La.; Union Sales Co., Bridgeport, Conn.; Peak's Garage, Selma, Cal.; Climax Motor Sales Co., Wilmington, Del.; Standard Auto Co., New Kensington, Pa.; J. L. Maxwell, New Castle, Pa.; Walter's Garage, Coraopolis, Pa.; Clackmas County Tractor & Auto Co., Oregon City, Ore.; John C. Signor, Rosebury, Ore.; Stanley Chapman, Winnemucca, Nev.; A. T. Henninger, Belleville, Ill.; V. J. Trares, Edwardsville, Ill.; National Trail Garage, Highland, Ill.; G. C. Williams, Corso, Mo.; J. W. Bandy, Hayti, Mo.; McCoy & Rogers, Perry, Mo.; Mason Transfer & Storage Co., Windsor, Me.; Fidelity Motor Co., Enid, Okla.; D. C. Welch, Lawton, Okla.; R. D. Henderson, Anderson, S. C.

PREST-O-LITE CONVENTIONS BEING HELD IN PRINCIPAL CITIES.

To put storage batteries in the public utility class, the Prest-O-Lite Co., New York, has arranged a series of educational conventions for its distributors, which are being held at New York, Boston, Richmond, Atlanta, Indianapolis, Chicago, Omaha, Kansas City and Dallas.

F. A. Wilson-Lawrenson, Vice President Prest-O-Lite Co.

"Efficient Service to Motorists" is the slogan back of these meetings, and officials of the company state that next year will see some radical improvements in storage battery service from coast to coast. Conservation is one keynote of the lectures given by the expert engineers of the Prest-O-Lite factories.

Properly cared for and adjusted, a battery should last at least two years and, to quote F. A. Wilson-Lawrenson, vice president of the Prest-O-Lite Co., "with a wide educational campaign showing motorists how to prolong the life of their lighting and starting equipment and efficient service stations along the road, the reliability of the storage battery will be taken as much for granted as the telephone or electric light.

"The importance of this cannot be over-estimated when the affairs of so many millions are greatly affected by the automobile. Fatal delays and dim lights will soon be a thing of the past, for millions who drive their own cars insist on improved service conditions and they are going to get them."

OFFICE ON PACIFIC COAST.

The Black & Decker Manufacturing Co., Baltimore, Md., maker of electric air compressors, has opened an additional office on the Pacific coast, at 201 Maynard building, Seattle, Wash., in charge of A. E. Nordwall, well known in that section among the automotive trade. Mr. Nordwall will have charge of the distribution of Black & Decker products in the State of Washington, working under the direction of the main Pacific coast office, 918 Hearst building, San Francisco.

ANDERSON ELECTRIC EXPANDS.

The phenomenal growth of the Anderson Electric Specialty Co., Chicago, maker of "autoreelite," and other electrical specialties, is indicated in the recent announcement that it has leased from the Ilg Electric Ventilating Co. the six and seven-story and basement building, 100 by 100 feet, at 154-160 Whiting street, on the north side of that city, affording 75,000 square feet of floor space. This lease is for a period of 15 years, at a total rental of $315,000.

As soon as the Anderson company takes over this new building the manufacturing capacity will be increased about 500 per cent. It will be equipped with the latest type of machinery and will have every modern appointment and convenience known to present day industrial plants, adequately providing for the increased expansion and continued success of the company.

The Anderson Electric Specialty Co. began business under its present management only three years ago, then occupying 3000 square feet of floor space at 562 West Van Buren street, later expanding to its present quarters at 118 South Clinton street. The officers are: President, E. G. K. Anderson; vice president and general manager, B. J. Grigsby; treasurer, J. A. Johnson; secretary, O. E. Grigsby; assistant secretary-treasurer, N. A. Engstrom. At the present time B. J. Grigsby, the vice president and general manager, is in Europe on business in connection with the development of the company's export trade.

J & B CO. INSURES EMPLOYEES.

Realizing that the success of a business depends largely upon the spirit of co-operation of those in its service, and also that the success of each individual depends upon the maintenance of this spirit in business relationship, as a practical demonstration of this idea, the J & B Manufacturing Co., Pittsfield, Mass., maker of electrical and ignition specialties, has arranged a system of life insurance for the benefit of its employees, without expense to the individual.

The following is the schedule, which is figured on the basis of length of service: Under one year, $500; over one year and under two, $700; over two years, $900. This amount will be increased $200 annually on the anniversary of the employee's entry into the employ of the company, until the policy has reached $1500.

The present officers of the J & B Co. are: President, Edward B. Jacobson; treasurer and general manager, George H. Southard, Jr.; sales manager, Floyd A. Knight; assistant treasurer, Raymond D. Tufts.

MOTOR CO. SUES RAILROAD.

The Memphis Motor Transportation Co., Memphis, Tenn., has brought a suit against the Memphis Street Railway Co. for $2500 damages for the wrecking of a truck operated by the Transportation Co., by being run into by a street car.

COMFORT SECURED WITH CAR HEATERS.

Comfort being one of the principal features that appeal to the owner of the motor car, the question of furnishing heat for the car in cold weather has a direct bearing on this phase of use, and a reliable heater is certain to have a strong appeal to car owners and prospective owners.

One of the noticeable points of motor car production this season is the trend towards equipment with car heaters, and this is indicated from the fact that 28 manufacturers are supplying all or a part of their lines this season with the Perfection motor car heater, made by the Perfection Heater and Manufacturing Co., 6545 Carnegie avenue, Cleveland, O.

Closed cars have always been sold on the basis of comfort and all-year use, but two manufacturers, who for the past two years have supplied their closed cars with heaters, have gone a step farther this season and are equipping their complete line, including all open-body models, with car heaters.

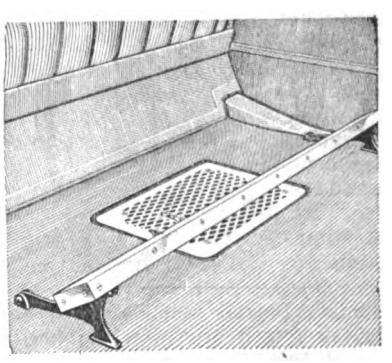
This season there is a big shortage reported in closed car production, and it has developed a serious situation for dealers who have an abundance of closed car prospects and an alarming scarcity of closed cars to sell. Dealers may thus find a new field here for the use of car heaters, inasmuch as in many cases they may be able to induce the prospect to accept a touring car equipped with well fitting curtains and a heater as a substitute to meet the shortage.

There is also a vast number of motor car buyers who cannot afford to pay the additional price of a closed car, but whose needs require a car the year round. In such cases car heaters should also make a strong appeal.

SINCLAIR OIL'S INCREASED FACILITIES.

The Sinclair Consolidated Oil Corporation has closed contracts for building steel storage tanks, docks, pumping facilities, etc., on its property at Tremley Point, Staten Island Sound, and will start fuel oil deliveries in New York harbor at an early date on contracts already closed.

An English syndicate has purchased all of the 16,000 reserve motor vehicles from the American Third Army at Coblenz, Germany.



Type A Perfection Heater.

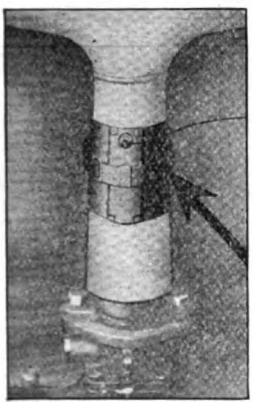
The Heiser Improved Cylinder Reboring Tool for FORD MOTORS is the only reboring Tool in the world that is self-sharpening. It is the only tool that rebores between centers—this insures a finished cylinder, square with the crankshaft, round, straight, true and free from taper. It is adjustable and the only tool that will rebore different sizes without losing the adjustment. **The best mechanic in the world can't build reputation without proper TOOLS and EQUIPMENT. THE HEISER IMPROVED CYLINDER REBORING TOOL makes good shops out of poor ones and better shops out of good ones. Write today for full particulars.**

HEISER SPECIAL TOOL CO., 216 Rogers Bldg., Kingston, Mo.



Starts Any Cold Motor In a Jiffy

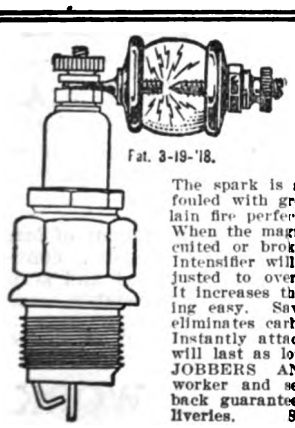
Attaches to the Intake Manifold or Carburetor. Current from battery to a resistance coil in a Heater warms the air inside the intake, causing the gasoline to **vaporize** and **ignite** with **first turn-over** of the motor. Same heating principle as used in the electric flat iron. Gives same results as pouring hot water on the manifold.

Electric Intake Heater assures easy and quick starting on the coldest winter day, **and saves drain on the battery.** No priming. No delays. Operates from dash switch. Easy to attach. **No drilling or tapping or alterations.** Entirely out of the way. Always ready and perfect in performance.

If your car has storage battery, write for descriptive matter today. **$3.50**

Dealers and agents: Get our proposition.

Electric Intake Heater Co. 130 Cortland St. Jackson, Mich.



It Finds Ignition Troubles

Attached to Any Plug
Stops All Spark Plug Trouble

Universal and Marvel Spark Plug Intensifiers

The spark is **always visible.** It will make a plug fouled with grease or carbon or with broken porcelain fire perfectly.

When the magneto is not working, a wire short circuited or broken, or the battery out of order, the Intensifier will prove it at a glance. It can be adjusted to overcome almost any ignition weakness. It increases the voltage and spark and makes starting easy. Saves in oil and gas. Adds to power, eliminates carbon and preserves plugs.

Instantly attached to any screw terminal plug and will last as long as the car.

JOBBERS AND DEALERS—This is a wonder worker and sells at a glance. Sold on a money back guarantee. Liberal discounts and prompt deliveries. *Send for full information.*

THE L & L SLIP-ON ONE-PIECE TRANSMISSION LINING

FOR FORD CARS

The L & L Transmission Lining is the practical and economical solution of all Ford Transmission problems. It is more practical, economical, lasting and satisfactory in service. The L & L Slip-On One-Piece Lining is made of the best braking material that can be made.

Any one can put them on. The saving in both time and labor is more than 66% when compared with the three-piece lining, and aside from that it slips into place, requires no rivets, felt gaskets or skilled repairer to adjust. The L & L Lining positively eliminates all clatter and vibration, does not glaze, stick, grate or slip. It brakes and holds and the efficiency continues until completely worn through. The economy lies in longer service life, saving in repair bills. Use means satisfaction and minimum transmission troubles.

JOBBERS AND DEALERS

Our proposition is extremely attractive. **The L & L Lining is already a big feature item with all who stock them. The demand is heavy and constant. The trade discounts are worth while. We offer something better than what was the best. Full details and trade discounts at request. Write today.**

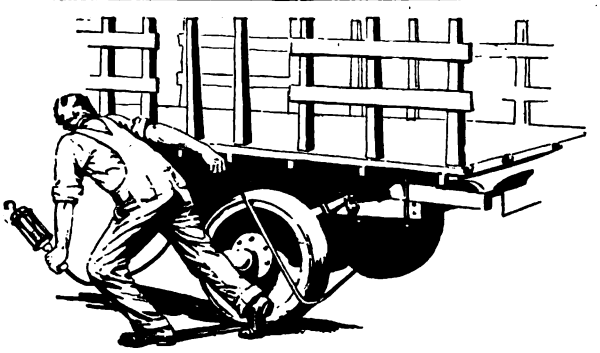
Treat it rough!



DURACORD EXTENSION LAMP

YOU can pull the cord on a Duracord Extension Lamp around corners without fear of damaging it. The cord is genuine Duracord, the portable electric cord with a heavy *woven* fabric covering—*not braided.*

Laboratory tests as well as actual use have conclusively proven that Duracord will outlast ordinary braided cord many times over.

There is no metal to cut through the insulation or scratch polished surfaces as on a steel armored cable. The cord is gripped in the lamp by a patented "holdfast" fitting that *won't* pull out. The guard is strongly made and protects the bulb to an exceptional degree.

This lamp in your garage or shop will mean the end of time-wasting tinkering with poorly constructed lamps and unsatisfactory cords.

Each lamp complete, all wired up ready for use with 20 feet of genuine Duracord. Packed in an individual box.

GENEROMETER

The new and practical generator testing instrument. It will locate shorts and grounds in generator armatures where most of the trouble is of a Lighting System. You will need this instrument if you want to be 100% efficient in your electrical repair work. Further particulars upon request.

PAUL G. NIEHOFF & CO., INC.
232 E. Ohio Street, Chicago, Ill.

Niehoff Laminated Magnetizer

This is the most scientific and practical Magnetizer ever constructed. It will magnetize any size magnet from a Ford to all the various other magnets used on the different cars today. Due to the fact that it generates an enormous amount of magnetism, with a pulling power of about 75 pounds, you can more quickly remagnetize a magnet, and, therefore save much current. All magnetizers are subject to considerable wear. The faces will wear down according to their use. The top pieces of our Magnetizer are especially hardened and also detachable so that when worn down they may be replaced at a very small expense. We have two types; one for 6 volt storage battery and another for 110 volt D. C. current. Write for further information.

VALVE REGULATES TIRE AIR PRESSURE

When Enough Air Has Entered Auto Tubes, Invention Warns.

An automatic pressure regulator for automobile tires, wherewith an exact and even pressure can be maintained without bother or guess work, has just been put on the market. It is manufactured by the Automatic Safety Tire Valve corporation.

Motorists welcome the new device as the invention that solves the difficult problem of maintaining fixed tire pressure. Although this is essential to the economical operation of the car and of vital importance to the motorist, it has been hard to accomplish without considerable trouble. The ordinary tire gauge is bothersome to use regularly. Rocking the car or kicking the tires to determine the air pressure in the tires is unreliable, at best, and often starts a break in the tire fabric.

The new automatic pressure regulator is permanently attached to each tire valve in place of the dust cap. It is adjusted by means of a movable collar, calibrated to read pounds of pressure. When the tires are inflated the regulator automatically shuts off the air when the set pressure is reached, at the same time giving warning by a distinctive whistling sound. This whistle is caused by the excess air escaping through a port in the side of the regulator.

In construction the automatic pressure regulator is much like an ordinary tire gauge. The movable collar around the top, with which it is set for any desired pressure, controls a ball and spring valve inside which will admit no air after the set pressure is reached. The excess air, whistling through the escape port, gives audible evidence that the pressure is right.

After the regulator is once attached and set it needs no further attention. When the tire is to be inflated the hose connected is attached in the usual manner. At the whistle warning the air hose is removed and the motorist goes on his way, secure in the knowledge that all of his tires are properly inflated.

As a large percentage of tire troubles is due to incorrect inflation, the importance of the automatic regulator is easily seen. To get the fullest possible mileage and ensure freedom from usual tire troubles, each tire must have the correct air pressure—not once or twice a week but all the time. With the automatic regulator this is possible. Results of its use are seen in fewer blowouts, greater mileage to the gallon of gas, longer tire life with greater total mileage for each tire, and lower repair bills.

Newspaper Clipping Showing How The Press Heralded the

Whistler
TRADE MARK
"IT WHISTLES WHEN IT'S HAD ENOUGH"

The appearance of the Whistler attracted attention all over America. Newspapers, magazines and trade papers endorsed it and hailed it as a distinct boon to the motorist.

Any product which receives such a welcome is sure of a permanent and growing success. The results so far have convinced us that the Whistler will make money for all who handle it.

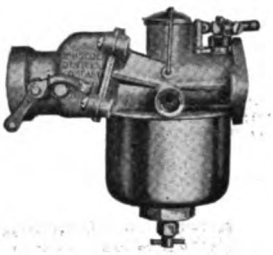
SCOE CARBURETOR

MAKES A FORD RUN LIKE A SIX



SAVES ITS COST IN 60 DAYS

Any dealer who puts a Scoe Carburetor on one Ford, opens for himself a neat and profitable line of business.

Simply because this carburetor enables the Ford engine to perform as nothing else can or will.

Write us to send you the Scoe on our 30 Day Trial Plan. Pay half the net—$4.25—on receipt of the carburetor. Put it on a customer's machine and check up its performance for 30 days.

Then pay the balance, or ask a refund, and we will make it without a question.

That surely is a fair offer, and hundreds of dealers have proved it so.

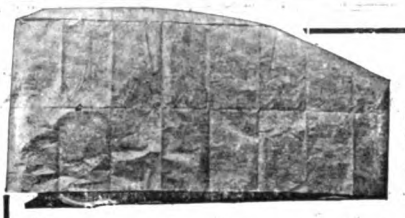
KEEP THE BODY OF YOUR CAR *SHINING* LIKE A MIRROR

No Grease to Catch Dust
Does Not Coat the Finish
Best Furniture Polish Made
Use With Spray if Desired

International Metal Polish Co.
INDIANAPOLIS, INDIANA



KENNEDY AUTO STORAGE COVERS

"Wrap Up" Your Cars When Not in Use

When you store your car for a season, don't let its polish be dimmed by dust, and its metal tarnished before it gets out of the garage. Cover it at once with a KENNEDY AUTO STORAGE COVER, and it will remain as clean and bright as washing makes it, until the cover is removed, next day or next season.

Protects the limousine all summer, or touring cars through the entire winter season. No cost but first cost. Never wear out if care is taken in handling. Insist that your garageman use them.

Popular for Use and Sale in Every Garage

Garagemen—Charge extra for storing with KENNEDY AUTO STORAGE COVERS. Service your patrons are glad to pay for. Many will demand it.

Made of strong, heavy paper, reinforced to prevent tearing. Protects a car against dirt, dust and moisture. Prevents polished portions from tarnishing and keeps finish from checking in cold weather, and also prolongs the life of the tires by excluding the light. Furnished for 5 and 7 passenger gasoline cars, electrics and Ford cars. Good profits in retail sales and service use. KENNEDY COVERS can be sold at a season when trade on other accessories is usually light.

Write for Free Illustrated Literature.

916-918 W. UTICA ST., Cor. BRAYTON
BUFFALO, N. Y. Bell Tupper 4666

August 11, 1919.

The Stenman Electric Valve Grinder Co., Inc.,
43 Southbridge St.,
Worcester, Mass.

Gentlemen:-

Replying to your letter of August 9th, would say it affords us much pleasure to send you our check to cover the cost of the Electric Valve Grinder sent to us for trial a short time ago.

We have no hesitation in stating that we have tried three or four other different makes of grinders, and consider yours much superior to any of them. Its smooth, velvety action enables us to make a much nicer job than any other valve grinder we have tried.

HHK/FM Yours very truly,

HALL MOTOR COMPANY,
By Harry A. Hall

The moral from the above letter, is that you insist on getting a "Stenman" and accept no other. "As good or better" has not yet been made. Your jobber can supply you—if not—write to —us. Circulars on request.

Made under U. S. Patents 876,449 1,313,490. Others pending.

"Will Pay 300%"

The Stenman Electric Valve Grinder will pay 300% yearly on the original cost where it is used to grind but one set of valves a week. If used more the returns will be proportionately greater.

"They Serve Best Who Are Best Equipped To Give Service"

The Stenman Electric Valve Grinder is the greatest time and labor saving tool that ever went into a repair shop. It is eight times quicker than hand work and does a better job. Thousands are already in use and you can depend on this wide use as a guarantee of its worth. Order one today from your jobber. It will have practically paid for itself before the bill is due.

Price $40.00—F. O. B. Factory

Figures Don't Lie!

The Crankshaft of a Ford car runs at 1,250 revolutions a minute.

The Camshaft makes 625 revolutions during the same period.

The Roller used inside the Timer makes 2,500 revolutions—4 times as much as the camshaft.

Is it any reason that there is an abnormal wear on this —the most important part of the Timer?

The McCULLOCH WIPE CONTACT, being designed in the form of a triangle does away with this extraordinary wear on the roller and for that reason it is **guaranteed to run at least 30,000 miles."**

SELLS FOR 60c.

SPECIAL PROPOSITION TO DEALERS AND JOBBERS.

WRITE FOR PARTICULARS AND DEALERS' HELPS.

This contact slides around with the same rotation or speed as the camshaft—making no revolutions at all—and will not only wear the contacts and insulations down equally and evenly, but will clean the beds and assure perfect transmission.

It saves 2,500 revolutions every minute that the Ford is being used.

It functions the same as the old style roller, but slides instead of rolls.

When it 'hits' a bump or 'strikes' a ridge it will not jump, but will turn on its end and continue as before.

There is not a chance of a misfire.

Made by the manufacturers of McCulloch Products for Fords.

For Safe and Steady Steering of FORD Cars

MAKES all the difference in the world in the "feel" of the car under you.

Takes up all the lost motion and looseness of the steering mechanism. Makes long drives seem short—no aching arms and fatigue. Permits full sweep of the wheels.

Adds no appreciable weight to the car.

Out of sight and out of the way.

Easily attached to front axle and steering rod by bolted clamps. Any garage man can attach in a few moments.

Fully guaranteed.

Send for descriptive folder and discounts to Ford and Accessory Dealers.

NEW YORK
AUTOMOBILE REPLACEMENT
IGNITION COILS

New York Automobile Replacement IGNITION COILS

New York Automobile Replacement Ignition Coils have actually put hundreds of the smaller Garages and Service Stations in business—and are today the most treasured line of the largest Service Stations throughout the U. S. The explanation is simple. Most drivers have learned that the best car and engine fitted with the highest grade carburetor and workmanship cannot deliver its full power, smoothness or service unless the Ignition Coil delivers more than "just a spark."

Weak, partly broken down coils spoil owners' pleasure and temper, also your reputation, and the car's utility. A special New York Coil engineered to suit the exact requirements of each car manufactured—that will fire the poorest gas—that positively will not "miss" at highest engine speeds and rival magneto ignition is available.

They are installed with no trouble in ten minutes, as they positively fit each other. Fifteen years of successful coil building experienced by an organization of Ignition Specialists, is the reason a car owner always agrees when told he needs a New York Coil.

More real profit, less come backs and easier made sales than any article you ever handled.

NEW YORK COIL COMPANY

338-340 Pearl Street New York, N.Y.

Adapted to any engine. Leaves both hands free to remove the key or pin.

MERTZ VALVE SPRING RELEASE

The Mertz is no ordinary make shift tool. There are no chains, notches, levers or springs. It is special tool equipment made for a distinct use and a guaranteed high quality product. The Mertz is easy and simple to operate. It locks automatically to any length. It will not bend the valve stems. It will easily compress the strongest valve spring made. It is unbreakable, very light and occupies but a small space in the tool chest or box. For emergency service it can be used as a clamp in general work and when tires or tubes are being repaired.

IT SAVES TIME, LABOR AND EFFORT. A TOOL FOR SHOP AND CAR.

To operate, place the Fork of the Release straddle of the Valve Stem under the spring. The self-centering gauge at the top of the Fork makes it adjustable to any valve spring seat. The hand screw is then turned and the arm becomes instantly locked. The valve head is positively held down in place while the spring rises. All other operations are as positive.

Mertz products are a good line for any dealer to sell. Utility tools that serve and save and are sold at the right price and afford the trade the right profit.

List Price, $2.00. Jobbers and Dealers Discounts at Request.

GET A WATERHOUSE WELDING OUTFIT AND WATCH YOUR BUSINESS GROW

Boost your profits—Swing the big profitable welding business to your shop. Thousands of repairers are doing it and most of them use a Waterhouse outfit.

Time is money and a Waterhouse Welding Outfit saves the time as well as labor. It affords utility great enough to meet any shop requirement, yet no shop is too small to own one.

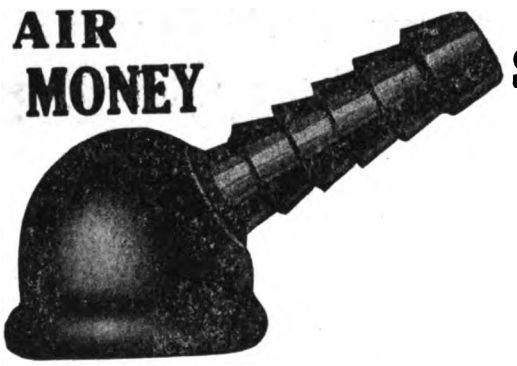
The great difference in welding outfits is all in favor of the Waterhouse. That means quality, utility, long service life, simplicity, dependability, low first cost and the best and most complete welding apparatus ever offered to the trade.

Write for descriptive catalogue, or better still, tell us your requirements. Do it today. We can supply the exact outfit for your needs.

All Waterhouse outfits are guaranteed.

WATERHOUSE WELDING COMPANY, 3 PELHAM STREET, BOSTON, - MASS.

FREE AIR COSTS MONEY



when the customers for whose convenience you provide an air station forget to turn off the flow after they have filled their tires.

Guard against this waste by attaching a

Schrader Universal Inflating Valve

to your air hose.

Thanks to this appliance your bottled air locks itself into the tank the minute it is taken off the tire-valve. You turn on the air by pressing the nozzle of the inflating valve against the tire-valve and you turn it off by removing the device from the tire-valve.

Made to fit any diameter of hose from ¼ in. to ⅝ in.

PRICE $1.50 in U. S. A.

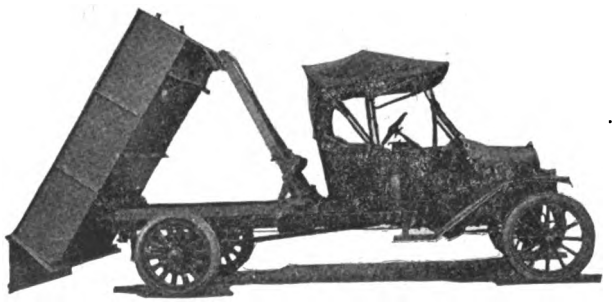
Manufactured by **A. SCHRADER'S SON, Inc.**
800 Atlantic Avenue, Brooklyn, N. Y.

Schrader products were awarded a Grand Prize and two Gold Medals at the Panama Pacific International Exposition. "There's a Reason."

THE PEERLESS HAND HOIST

Single Cable Quadruple Worm Gear Drive

For Any Make or Type of Truck.



A wonder in efficiency and speed. It will fit any chassis and body. Weighs but 200 pounds. Simple, fool proof, wholly dependable and will last for years in the hardest service.

Any one that can drive a truck can hoist the heaviest load to 30 or 50 degrees in the longest body in less than two minutes. The smaller the body and load the quicker the action.

But two gears are used, quadruple worm and gear (both machine cut) and housed to protect from dirt and dust. The single cable makes an even pull. Compact and can be installed without drilling holes in chassis frame. The body hitch is also furnished.

We specialize in building all-steel bodies for any need.

Write for complete information.

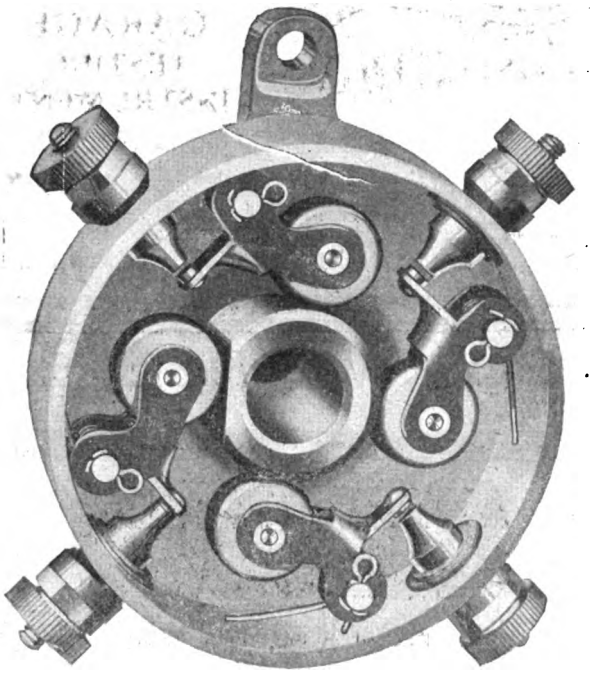
Revolutionizing Timer Manufacture



DUNTLEY
MAGNETO BREAK
TIMER

Here is the Timer for Ford motors that overcame all the causes of timer troubles.

It requires no lubrication.

It has no sliding or whirling contacts to become rough and wear out or to skip and jump over metal segments, or become insulated with oil.

It provides an individual magneto break for every cylinder.

It is equipped with genuine Tungsten Points that will not pit, corrode or burn out.

It is guaranteed for 50,000 miles—more than 10 times the life of the ordinary timer.

The tremendous sales record it has made is proof of its economy and efficiency on Ford or Fordson Tractor motors.

Write us today for all the particulars.

J. W. DUNTLEY
1003 Michigan Ave., Chicago, U. S. A.

Security Auto Lock

Affords every protection to Ford car owners that a perfectly designed and extremely well made lock can give. While neat and attractive it is built very strong. In operation it is positive and the car can be left with a feeling of confidence that no one but the owner can use it.

It is the original loose wheel lock for Fords.

It is approved by underwriters.

It will reduce insurance premiums 15%.

When locked the car cannot be towed.

List Price, $6.00

It makes the Ford thief-proof

Anyone can easily install the Security in ten minutes. No drilling, filing, sawing or chiseling necessary. It is made of solid brass. Nickel plated finish.

TO DISTRIBUTORS

When this lock is shown no other will satisfy Ford car owners. It sells at sight. Our trade discounts are liberal and our proposition will interest any one that can sell high grade car protection at a moderate price. ***Write for details today.***

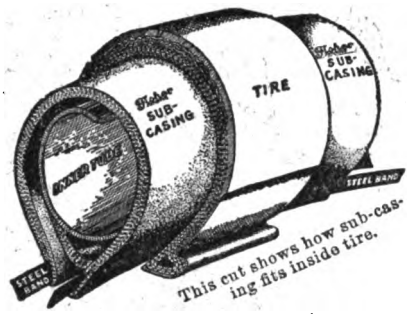
All the Mileage There Is in the Tire



This cut shows how sub-casing fits inside tire.

is assured by the use of

THE *FISHER* PATENTED "RIM GRIP" SUB-CASING

Built to conform strictly to the design and workmanship of standard tires; it is the only device of its kind holding the air independent of the tire, offering unusually efficient means of relief.

Tires equipped with Subcasings can be worn down to the last layer of fabric and the Subcasing transferred to another tire.

Proof of their superiority will be evident when the results of actual tests are noted.

Reflexions of No-trouble ignition. An unretouched photo of the plug referred to below.

Do the Business in 1920 which other Reflex Dealers did in 1919

REFLEX Spark Plugs sell because of an undisputable past record of giving trouble-free ignition. In recent advertising the story of Reflex Spark Plugs which have gone two, three and five years—often without cleaning—has been told motorists who buy from you. For instance, the plug illustrated above has delivered for two years without even being cleaned.

Such results will mean business for you in 1920. Consider it as well as the fact that the Reflex proposition is profitable.

Will you write for a few details of what other dealers have done with Reflex Sparks Plugs? It's none too early to be thinking of the BEST lines you can handle during 1920.

PUT YOUR NAME ON THIS PAY-ROLL

Men like you are wanted for big-pay positions in the fascinating field of automobile engineering. We have made it easy for you to fit yourself for one of these positions. You don't have to go to school. You don't have to serve an apprenticeship. Fifteen automobile engineers and specialists have compiled a spare time reading course that will equip you to be an automobile expert without taking any time from your present work.

Auto Books

6 Volumes Shipped Free

Now ready for you—an up-to-the-minute six-volume library on Automobile Engineering, covering the construction, care and repair of pleasure cars, motor trucks and motorcycles. Brimming over with advanced information on Lighting Systems, Garage Design and Equipment, Welding and other repair methods. Contains everything that a mechanic or an engineer or a motorcyclist or the owner or prospective owner of a motor car ought to know. Written in simple language that anybody can understand. Tastefully bound in American Morocco, flexible covers, gold stamped, 2,650 pages and 2,100 illustrations, tables and explanatory diagrams. A library that cost thousands of dollars to compile but that comes to you free for 7 days' examination.

Partial List of Contents

More than 100 blue prints of Wiring diagrams.
Explosion Motors
Welding
Motor Construction and Repair
Carburetors & Settings
Valves, Cooling
Lubrication
Fly-Wheels
Clutch
Transmission
Final Drive
Steering Frames
Tires
Vulcanizing
Ignition
Starting and Lighting Systems
Shop Kinks
Commercial Garage Design and Equipment
Electrics
Storage Batteries
Cars and Repair
Motorcycles
Commercial Trucks
Glossary

Only 7c a Day

Not a cent to pay in advance. First you see the books in your own home or shop. Just mail coupon and pay express charges when books arrive. You can read them and study them for seven whole days before you decide whether you want to keep them or not. If you like the books send only $2 in seven days and $2 a month until the special introductory price of $19.80 has been paid. (Regular price $30.00. Along with the set goes a year's consulting membership in the American Technical Society. (Regular price $12.) This great bargain offer must soon be withdrawn.

Send No Money Now

Don't take our word for it. See the books without cost. There is so much profit in this offer for you, that we urge you to waste not a moment in sending for the books. Put the coupon in the mails today. Send no money—only the coupon!

American Technical Society **Dept. A-788, Chicago, Ill.**

American Technical Society,
Dept. A-788, Chicago, Ill.

Please send me the 6-volume set, Automobile Engineering, for 7 days' examination, shipping charges collect. If I decide to buy I will send $2 within 7 days and the balance at $2 a month until the $19.80 has been paid. Then you send me a receipt showing that the $30.00 set of books and the $12 Consulting Membership are mine and fully paid for. If I think I can get along without the books after the seven days' trial I will return them at your expense.

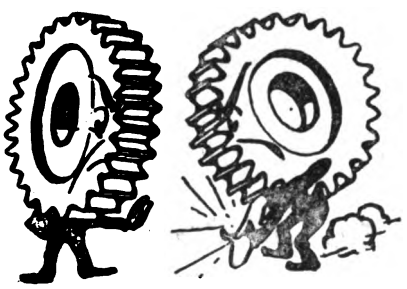
SAFE POWERFUL CHEAP

"LAFAYETTE PORTABLE STEEL CRANE"

The war is over and we are ready again to fill orders promptly. Labor and materials are 100% higher than pre-war. Our advances are only 50%. It is steel. It will not break. Roller bearings. Low center of gravity and will not upset. Double locked. It is safe. It is a heavy, strong machine for heavy, rough work. It won't wear out in 100 years. For the thousands in use we have not furnished $100 worth of repairs in seven years. It will always invoice at cost. It is in every state and most foreign countries. The only successful steel crane made and standard everywhere. It saves its cost in a short time. No first class garage or shop is without them and none other should be. For sale by jobbers everywhere. If the jobbing men who call upon you do not have it listed, write direct to the manufacturers.

LAFAYETTE ENGINEERING COMPANY
LAFAYETTE, INDIANA.



WHEN GEAR MEETS GEAR

When gear meets gear there is bound to be more or less friction. But that friction can be held down to a negligible minimum by proper lubrication.

DIXON'S GRAPHITE Transmission and Differential LUBRICANT

is specially compounded for gear work.

It stands the terrific pressure that is set up when gear meets gear—pressure that "squeezes out" ordinary oil or grease and allows a ruinous metal-to-metal contact—and it sticks to the gears when they are idle, which is just as important.

It lubricates efficiently under all temperatures—without "bunching up," congealing or "breaking down" as is the case with ordinary lubricants.

Stock this Dixon Lubricant and sell it to your customers. You'll be surprised at the sales results.

Write for prices and Booklet No. 49-G.

Also ask about Dixon's famous Cup Grease.

Made in Jersey City, N. J., by the

GILL

The Perfect One Piece Piston Ring

"See that joint? That's the reason why I install Gill Piston Rings on my jobs. It's the one piston ring that I consider mechanically perfect."

When you hear a mechanic talk like that you may be sure there is something about the Gill Piston Ring that makes it different from any other. Mr. Dealer, try it out this way. Show a Gill Ring to the best automobile mechanic you know and see if he doesn't endorse what the man in the picture is saying.

One look at the double step interlocking joint shows him that the Gill Ring can expand from 1/8" to 3/16" without any loss of compression. That means it will adjust itself to oversize, worn or out of round cylinders within reasonable limits.

Look into this piston ring proposition for yourself and when you compare the Gill with any other ring on the market you will be convinced like the thousands of other men who handle this ring exclusively.

Send for the new Gill Piston Ring Size Directory, complete, convenient, and full of just the information you need. It is free to the trade.

Dealers—Ask your jobbers about them

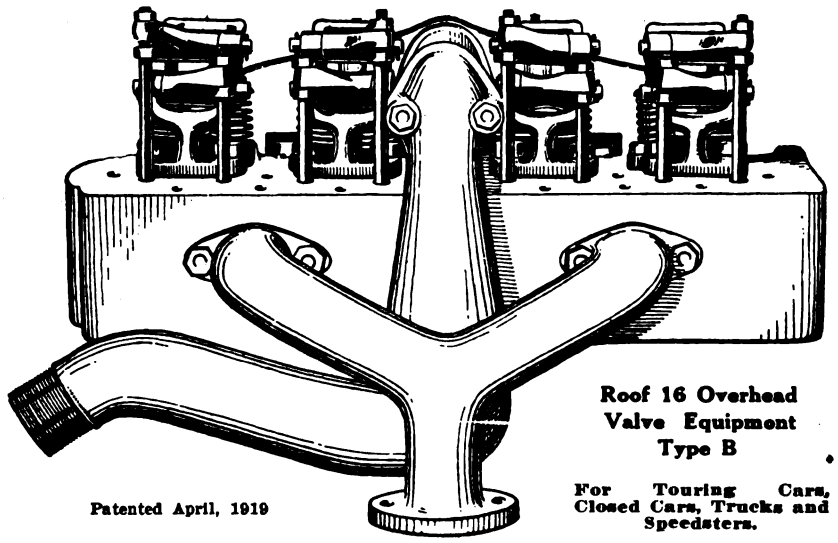
POWER and SPEED ROOF 16 OVERHEAD VALVE EQUIPMENT for FORD MOTORS



Patented April, 1919

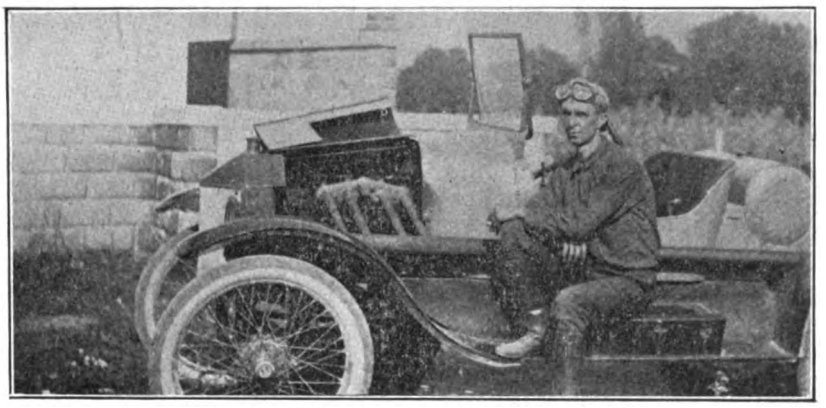
Roof 16 Overhead Valve Equipment Type B

For Touring Cars, Closed Cars, Trucks and Speedsters.

The Most Remarkable Power Device, Even in This Inventive Age

Hill climbing for touring cars—pulling power through sand and mud—doubles the hauling capacity of converted Ford truck-speed for mile and half-mile tracks to rival the fastest cars built. Ford racing cars with our Cylinder Head Equipment and special racing parts have attained speeds from 80 to 100 miles per hour. Hill climbing and pulling power for touring cars, closed cars and trucks. Price, complete, $115.00 f. o. b. factory. Nothing extra to buy. Cylinder head equipment all ready for installation. It takes the place of the regular Ford Cylinder Head. Any mechanic can easily and quickly install it.

Comparison Brake Horse Power Tests at the United States Bureau of Standards gave Standard Ford motor with regulation carburetor 18.7 Horse Power. The same motor with 16 Valve Head and regulation carburetor 22.4 Horse Power. The same motor with 16 Valve Head and Special carburetor 29.7 Horse Power. Recent tests at Bureau of Standards with Type B gave 32 Horse Power. We are Manufacturers and Distributors of speed and other specialties for Ford cars; 3 to 1 gears, high speed camshafts, aluminite, light grey iron pistons, lynite pistons, aluminite connecting rods, racing spark plugs, racing carburetors, roller bearings, counterbalances, wire wheels, multiple speed transmission, high tension magnetos, special oiling system, special worm and gear, steering gear, racing tires, racing bodies, hood and radiator, parts for underslinging chassis. Tell us what you want. We can supply it. Racing quality. Lowest prices. Send for our Complete Literature on how to build fast cars and double the value of your converted Ford Truck and descriptive circular on Speed and other Specialties for Fords.



HOWARD JARVIS
ZIONSVILLE, IND.

and his record breaking Ford equipped with Roof 16 Valve Head. Winner of the 15-mile championship race at Indianapolis State Fair in September. Car has attained a speed of 76 miles per hour.

Ford Racing Car Speed Kings

From the hundreds of fast Ford car drivers we mention the names of a few of those who have won laurels through the use of our equipment and some with speed records approaching that of the highest priced racing cars in the world, ranging from 70 to 97 miles per hour, and who on mile and half-mile tracks have closely approached the world's record with their speed cars:

Cold Weather has no Terrors for the Ford Car Equipped with

MODINE SPIREX RADIATORS for Fords

BITTER, cold, zero weather—when everything is ice and snow—you need not keep your Ford locked in the garage if it's equipped with a SPIREX radiator.

With extra large water channels and a core construction of the strongest metal stock, the water circulates freely and in larger quantities—a great resistance against freezing.

In addition the famous SPIREX Spiral adds to the strength and rigidity of this radiator, making for a greater durability—making a radiator that is practically leak-proof. The SPIREX radiator was the only one that successfully passed the Government tests for war use on the famous five-ton military tractors. It is built to stand the roughest service under all weather conditions.

If a SPIREX radiator safeguards your Ford you can use it as satisfactorily in freezing weather as on a mild summer's day.

Don't risk using your old radiator another day. Ask a dealer for a Ford SPIREX, or write direct to the

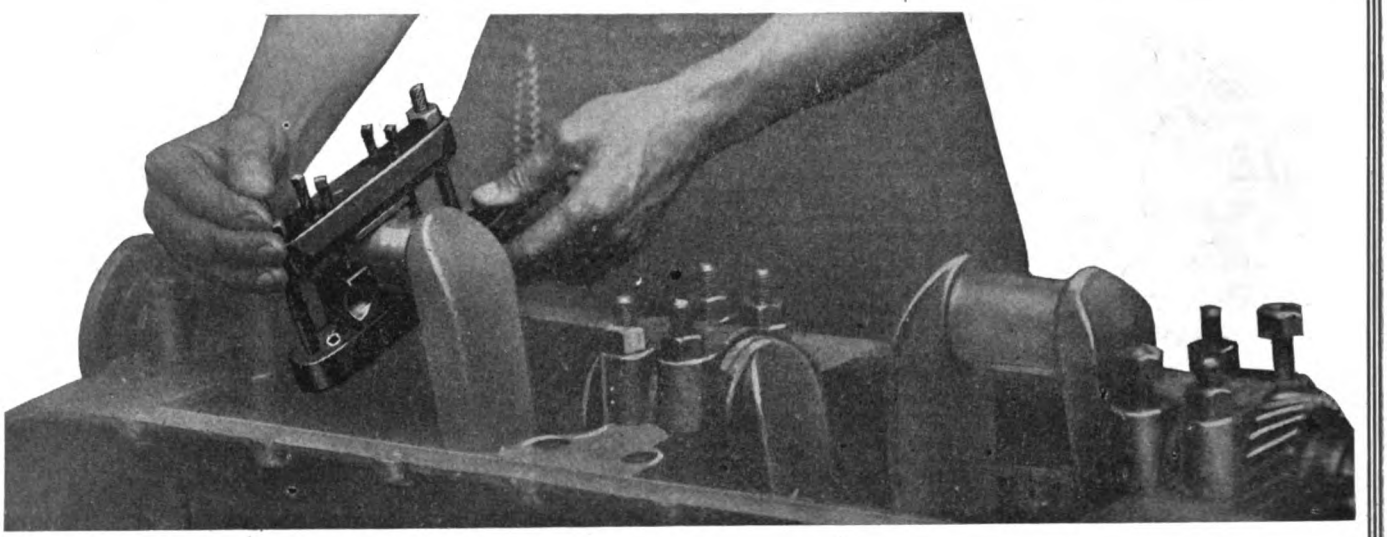
The Quick, Easy and Profitable Way to Grind a Crankshaft



Patented Nov. 11th, 1919.

JUST one job pays the cost of Atlas Abrasive Tool **(Patented Nov. 11, 1919).**

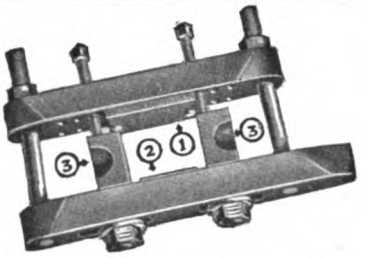
No experience required. The Atlas simplifies crankshaft grinding.

No lathe or other equipment required. Use a vise if you like, but remember that the crankshaft need not be removed from the crankcase.

One hour completes the work on any crankshaft.

No machine shop guarantees greater than two-thousandths of an inch accuracy. With the Atlas you get one-thousandth.

If you need an Atlas but once a year, it accommodates your customer, puts a good profit in your pocket and gives you a reputation for service.



1. *Hardened and tempered steel-cutter. Cuts in one direction only.*

2. *Bronze track bearings. Cannot cut ring in pin like hard steel nor freeze against pin from friction like soft steel.*

3. *Adjustable Abutment Blocks, which slip easily up against the face of the crank pin and hold the cutter and track in their proper working place.*

Price, complete, with cutter, $10, postpaid. Extra cutters (including bronze bearing tracks), good for from 10 to 20 pins or bearings, 30c each.

Another hand tool would cost from five to ten times the price of an Atlas—you would not get Atlas convenience—nor simplicity of its one cutter principle—nor the saving of time in making adjustments.

Adjustable to crank pins and bearings up to 2½ inches diameter for all passenger cars and trucks. Hundreds of garages and repair shops are enthusiastic users of the Atlas Abrasive Tool—it's selling like hot cakes.

A good mechanic would rather part with a $50 bill than with his Atlas, if he would not buy another.

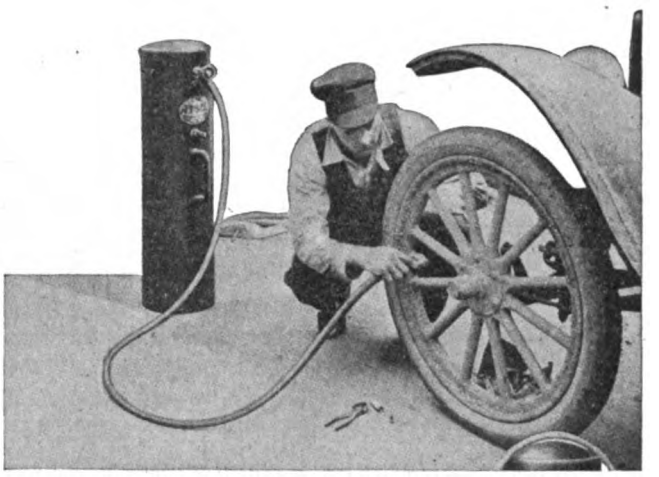
REAL EMERGENCY EQUIPMENT

THE

ATSCO PORTABLE AIR TANK



FOR ROAD OR GARAGE USE

It saves time and it saves labor. Both of these cost you money. Productive labor counts. Turn the valve and the tires are filled to maximun pressure, almost instantly.

LIST PRICE
$24.50
F. o. b. Pittsburgh, Pa.

Estimate what this means to you in your work for a year—and an Atsco tank has a service life of 10 years. Worth saving? Just think it over.

Just throw an Atsco in the car when called upon to do emergency work. With an Atsco there can be no delay. No back breaking pumping. No question about air.

Remember, your customer pays for what you do for him, not how you do it. All the time and labor saved is clear profit.

Atsco tanks are light, easily handled and can be filled by any compressor system. They are 36 inches long and 10 inches diameter, constructed with genuine copper brazed seams and suitable for 250 pounds working pressure or 500 pounds test pressure.

The equipment includes a standard tire filling valve, a protection valve cap for filling at a compressor system connection, and an eight-foot hose, everything that is necessary.

We specialize construction of garage pressure tanks, and have in stock or build to specification tanks of any size or pressure requirements. Our tanks are used by most of the producers of compressor and air storage systems.

These tanks are genuine copper brazed construction and the seams and joints are far stronger than the stock metal. They will not crystallize or crack and are guaranteed air tight.

We make pumps and pressure tanks for all purposes.

Produced only by

AIR TIGHT STEEL TANK COMPANY

Filtered Air

TAKE a sheet of clean white paper and hold it before the nozzle of a No. 7 Filtered Air Outfit. Turn on the air and watch the paper. You won't see a particle of oil, dust or dirt collect on the paper! The reason is very simple. The air has been washed thoroughly and is free of oil, dust, dirt and all foreign matter that might possibly injure a tire.

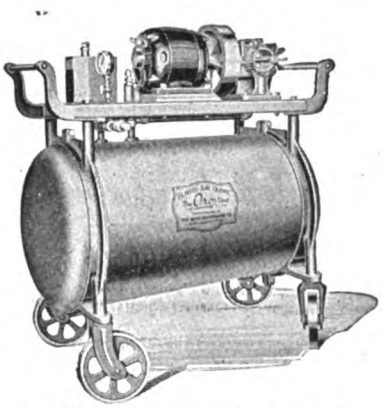
And because motorists appreciate the value of using such air in their tires, the Filtered Air Outfit is a wonderfully profitable investment for you. You attract trade—you hold it. You make it worth while for all classes of motorists to come to your place of business and they will gladly buy from you the things you can supply for their cars.

A Remarkable Outfit

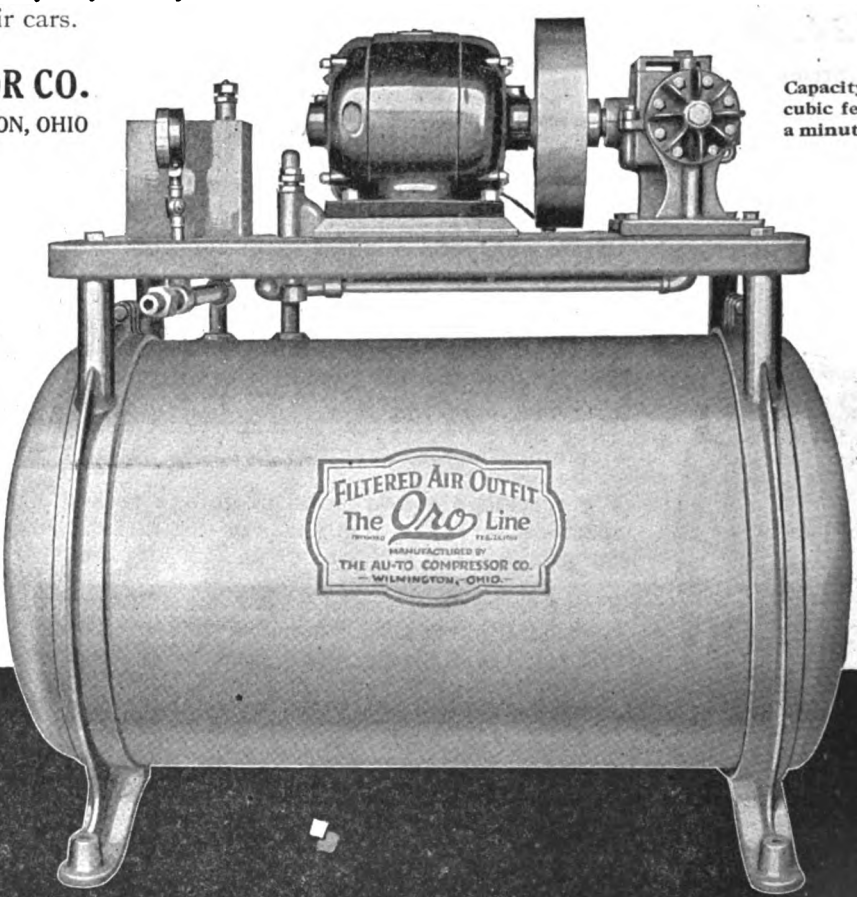
The "Filtered Air" outfit is complete—ready to run. You simply connect it with your electric wiring and it will immediately fill the tank with perfectly clean air, and keep the tank full—day and night. Sufficient pressure for pneumatic truck tires up to 150 lbs. Only 3 moving parts to compressor mechanism, in addition to valves. ½ horse power motor.

Get this splendid machine and watch your business increase! Ask your jobber, or send us his name and we will see that you are supplied quickly.

THE AU-TO COMPRESSOR CO.
303 S. Mulberry Street WILMINGTON, OHIO



Model No. 8 Au-To Air Compressor —same as No. 7, excepting that it has large wheel casters, which make it easy to move from place to place in the shop or garage.



Capacity over 4 cubic feet of air a minute.

a sign like this

brings business.

Why Take Chances?

As an expert mechanic—you know that carbon causes 98% of all engine trouble. You know also—that carbon is caused by leaky piston rings—which pump oil into the cylinders, where it does not belong. Lubricating oil does not explode—it burns—and forms carbon deposits. Carbon is an abrasive—like emery. If it is allowed to accumulate—it pits the valves and valve seats, produces abnormal wear of cylinders, pistons, piston rings and all engine bearings—causes faulty ignition, loss of compression and power—waste of gas and oil. In time it ruins the entire motor or makes regrinding and general overhauling absolutely necessary.

Install BURD Piston Rings

Approved by the World's Greatest Automotive Engineers

You can safely recommend BURD High Compression Piston Rings to your customers. They were selected for use in the Aviation Service—by the world's greatest automotive engineers—after the most rigid competitive tests. 16,000 Commissioned American Aviators, 5,000 Canadians and thousands of French and British Aviators learned to fly in planes equipped with BURD Piston Rings during the war, where efficiency was vital—because life was at stake.

BURD Piston Rings are easy to install—fit accurately to .00025 of an inch—are *guaranteed* against flaws and breakage—and warranted to produce higher compression and develop more power with less fuel and lubricating oil than any other piston ring made. The BURD Patented Guard Automatically Compensates for Wear and insures oil tight—gas tight—high compression—freedom from carbon trouble and a clean, economical, highly efficient engine.

Write for 1920 BURD Piston Ring Directory

It gives complete piston ring information, sizes and oversizes for practically every make and model engine for automobiles, trucks, motor boats, tractors, etc., with instructions for installing and scores of helpful hints and suggestions for mechanics.

All Jobbers Carry Complete Stocks—To Fill Rush Orders

Write to our Engineering Department for any information you want regarding special sizes or oversizes. This factory service is at your command—at any time—without charge.

ALSOP-ALL-SPARK

This Test Proves

Address Reply to Duplicate to
DIRECTOR OF MILITARY AERONAUTICS
Washington, D. C.

IN REPLY PLEASE QUOTE
FILE NO. _____

WAR DEPARTMENT
OFFICE OF THE DIRECTOR OF MILITARY AERONAUTICS
WASHINGTON
January 18, 1919

From: Engineering Officer, Camp Morrison, Va.

To: Commanding Officer, Air Service Depot.

Subject: Supplemental Report on Test of Alsop Ignition Device.

1. In order to ascertain whether the device would insure ignition through plugs that were carbonized, cracked or rendered inoperative from other causes, one quart of oil above high level was placed in unit #9, the car was run until the motor died and could not be again started. The spark-plugs were then inspected and found to be heavily carbonized.

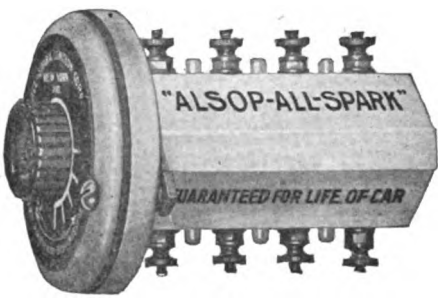
2. The Alsop Device was then attached, and within a short time all plugs were firing perfectly. The plugs were immediately removed and found to be clean - free from oil and carbon.

3. Then the Alsop was removed entirely from the car, motor was started again and ran for about four hours, then due to the excess oil still in crank-case, the plugs again became fouled and motor stopped. The heavily carbonized plugs were examined and replaced without cleaning.

4. The following day, Jan. 20th, the Alsop device was reinstalled with same results as before.

5. Later, a mixture of 50% kerosene and 50% gasoline was placed in the tank, no changes were made in the motor, carburettor or ignition device. The engine started as easily as with straight gasoline, developed greater power and continued to operate as above. No carbon formations were found on the plugs after using up the tank full of the above mixture.

Lloyd A. Taylor
Lieut., A.S.M.A.



THAT our claims are too conservative. What the War Department found to be true about the All-Spark is proven every day — Wherever this wonderful little device is installed owners enthuse over it. They find that it will cause old, cracked, carbonized, and oil soaked plugs to give powerful sparks. It eliminates carbon, saves gas, develops greater power and insures continued driving without misfires.

DEALERS — HERE'S YOUR CHANCE

There's a constant and growing demand for such a device — one that is absolutely guaranteed — one that has no dangerous exposed spark gaps, which may set the car afire, one that does not make a car hard to start or cause uneven timing.

Send $7.50 for 4-cylinder device with money back guarantee.

Here's Good Winter Business-Equip Fords with Dyneto NON-Stallable Starting & Lighting Outfits

Dyneto TRADE MARK REGISTERED

Sell a high grade, dependable Starting and Lighting System—one that is proven to have "big car" quality. Dyneto—a NON-Stallable Starting and Lighting System for $85. (With a good dealer profit.)

The System is complete, with motor-generator, storage battery, battery box, all wiring, switches, brackets, sprockets, etc., etc. Can be easily installed.

It has the same characteristic features as the Dyneto system that has been used continuously since 1913 on America's highest priced light weight car, the Franklin.

Makes Fords NON-Stallable

The big advantage of this system over others is that it makes the engine NON-Stallable. If too sudden application of clutch brings motor to stop, Dyneto instantly takes hold and starts it—**automatically**—**driver** doesn't have to press a button or move a lever.

In emergency, Dyneto is powerful enough to move car out of danger, without the motor.

Liberal Discounts To Live Dealers

Only a limited number of these outfits are available for immediate shipment, and orders will be filled in the order in which they are received. Write for discounts for dealers. Better wire quantity you wish reserved for you.

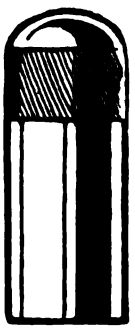
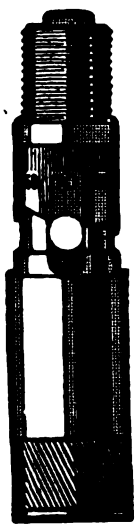
The Whistler

TRADE MARK
"IT WHISTLES WHEN ITS HAD ENOUGH"





Here it is, screw it on. Twice actual size.

would have saved that blowout!

ONE blowout may cost you a big piece of business — may endanger a life — certainly it is most unpleasant.

Why risk it? Nearly all blowouts are caused by overinflation. With Whistlers on your tires you can't overinflate if you set them for the right amount of air. They automatically close when the pressure is just right, saving your tires and helping your car.

The Whistler Pressure Regulator is an automatic tire valve that screws right on over the ordinary valve. It protects and guards your tires from the large losses occasioned by incorrect inflation.

This extraordinary invention has enjoyed a great introduction, both to the consumer and to the trade. At the close of its first year, we feel confident in saying that it has *made good* as one of the steady, consistent sellers. Turnovers are quick and sure—profits generous and selling helps are of the right kind.

If you haven't stocked the Whistler yet, be sure and do so without delay. Ask your jobber or write us.

We shall exhibit at the New York Show, Grand Central Palace, January 3rd to 10th, 1920.

The Automatic Safety Tire Valve Corporation

1765 Broadway, New York City

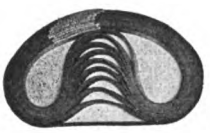
Fan Belt Conditions are Changing



The fan belt business has not been free from the general shake-up. The change in the past year has made 1920 prospects as different from 1919 as from 1918—and no one wants to be two years behind the times.

The 100% fan belt line of 1919 is only the 58% line of 1920. This is because cars are changing, We offered a complete line the past year in our splendid assortment of flat belts.

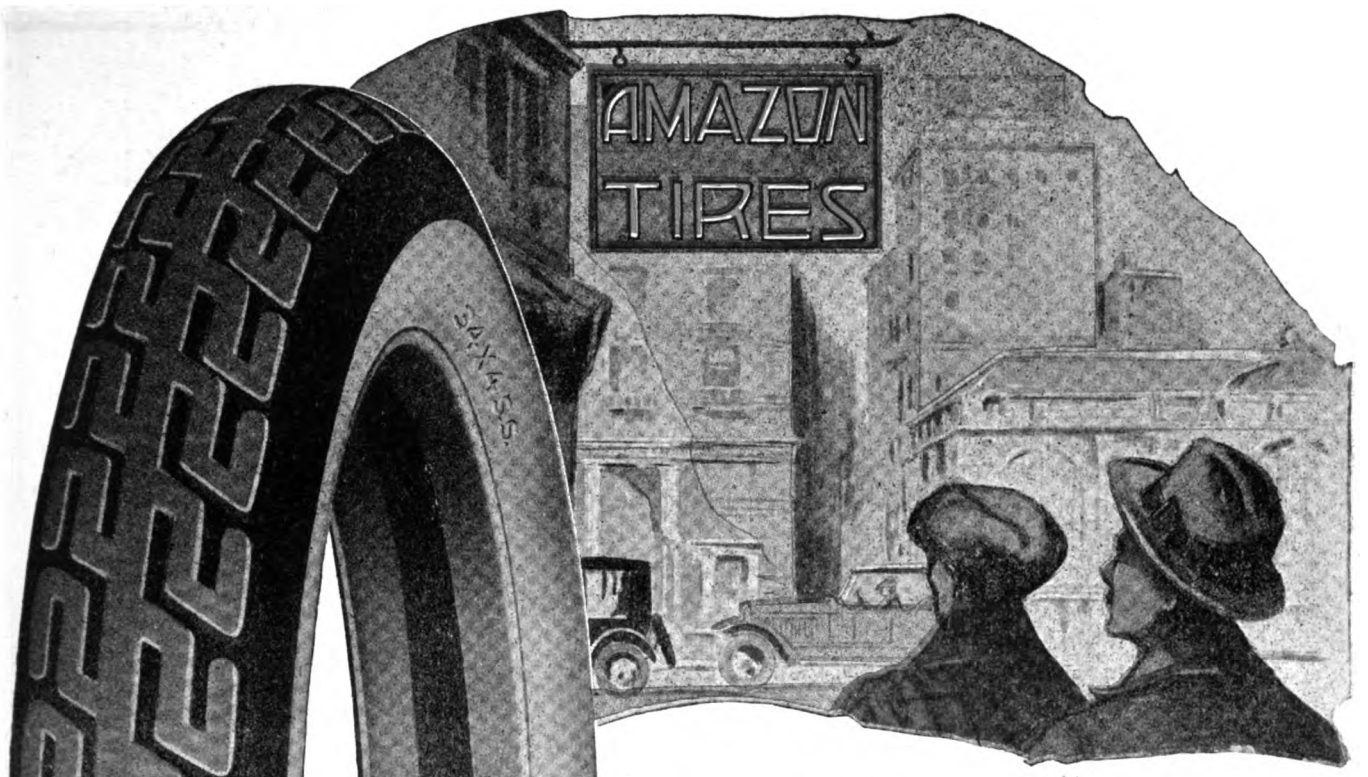
But that's not the complete line now. The 100% dealer must have an assortment of flat belts and solid V-belts, a stock of laminated V belting and flat belting in rolls.

Of course, the Gates Vulco-Cord line is the first to offer a 100% stock. This coupled with the patented features of Vulco-Cord and its popularity, make it still the most desirable and most profitable to handle.

It's just as easy, just as cheap and far more satisfactory to be in a position to handle 100% of the business as to try for only 58%. Tell your jobber it must be Vulco-Cord.

GATES VULCO CORD BELTS
"The Standardized Fan Belt"

MADE BY GATES Rubber Company DENVER



The Amazon Sign Stays

It is a significant fact that—once an Amazon Dealer, always an Amazon Dealer.

The Amazon sign, once placed, stays on the dealer's store season after season, marking the way for Amazon buyers.

This feature of an Amazon sales franchise has become so marked as to cause comment.

Although this record is remarkable, its reason is simple. It lies in the success Amazon dealers enjoy.

Amazon dealers of former years continue as Amazon dealers today because they find the arrangement decidedly profitable.

Every year is a better year for Amazon dealers. They have learned to regard each season's substantial profits as a truthful forerunner of a still more profitable season to follow.

DEALERS: We know of places where there are openings for aggressive Amazon dealers. Write us immediately.

BRUNNER

THE same foresight that urges a man to "lay aside something for a rainy day" inspired our engineers to build a surplus of strength, endurance and dependability into the entire Brunner line of garage air compressors, to meet the unexpected emergency that comes sooner or later.

It is that occasional demand for hour after hour work to keep up the needed pressure during the rush season or for an exceptional number of large truck tires, that proves the value of that surplus capacity and durability.

The ability to do this whenever necessary, without breakdown delay or attention has won the enviable reputation held by Brunner Air Compressors.

Performance records prove the value of the skill and foresight of Brunner engineers to the owner of Brunner equipment.

DUFF GENUINE BARRETT JACKS

Released from the Nation's Service

During the recent world crisis, priority had to be granted by the Duff Manufacturing Co. to all orders that involved the war needs of our country and its allies.

The pressure of production at our shops became terrific. It was impossible to fill many orders for passenger car and motor truck jacks.

Fortunately, this condition is now a thing of the past. Production facilities have been increased and the Duff Manufacturing Co. is again in a position to afford its dealers and jobbers the service to which it owed its supremacy as the largest manufacturer of jacks in the world.

Write for information regarding the Duff line of jacks for passenger cars, trucks and garages.

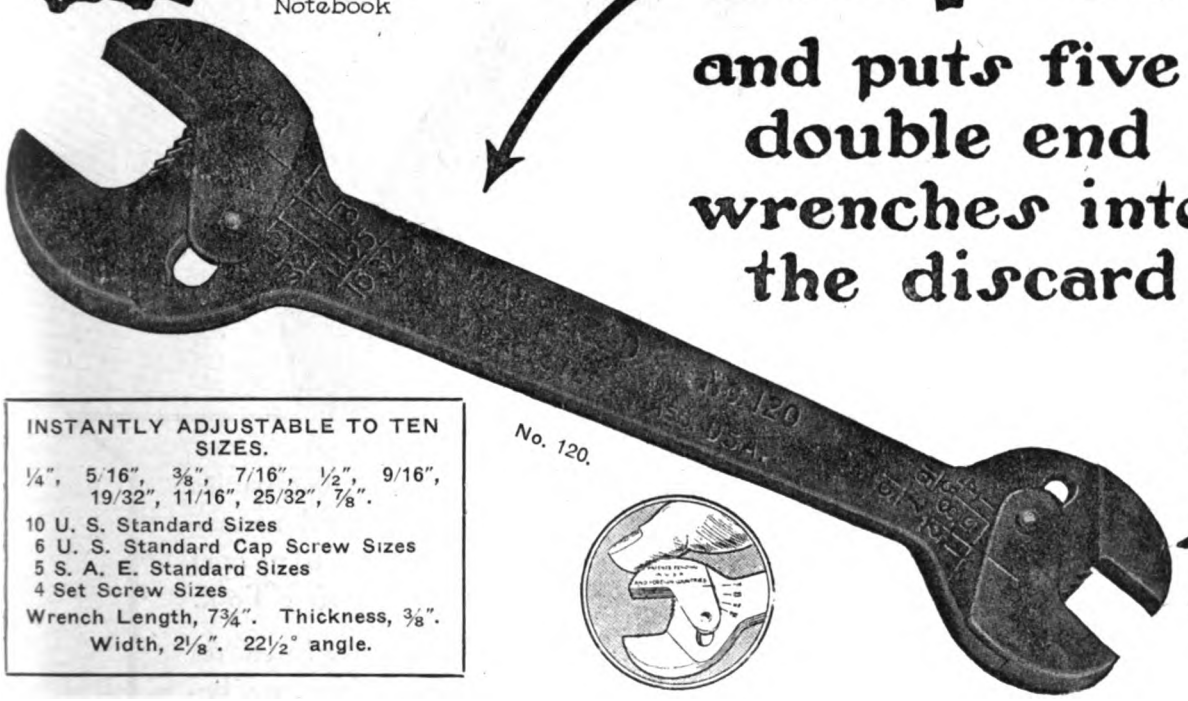
We thought we had a wrench that would fit any nut. We didn't-and couldn't borrow one. We had to drive with a loose bolt. The part broke. We wasted time and much effort. Had to wait by the roadside for hours until the repairer made the replacement. NOW WE HAVE A WIZARD.

From a Motorist's Notebook

Saves Time and Temper

and puts five double end wrenches into the discard



No Knurl Adjustment
No Back Lash

Patents pending in U. S. and Foreign Countries.

INSTANTLY ADJUSTABLE TO TEN SIZES.

¼", 5/16", ⅜", 7/16", ½", 9/16", 19/32", 11/16", 25/32", ⅞".

10 U. S. Standard Sizes
6 U. S. Standard Cap Screw Sizes
5 S. A. E. Standard Sizes
4 Set Screw Sizes

Wrench Length, 7¾". Thickness, ⅜". Width, 2⅛". 22½° angle.

The value of any tool aside from its quality lies in its utility.

The Wizard Wrench is a ten size wrench all in one and the Wizard is a Wakefield product which is a guarantee of the highest quality.

To use—simply lift jaw, slide to size and drop into mesh. It is the simplest and most practical tool in use ever devised for car or truck owner and repairer.

No better designed or made wrenches have ever been produced than the famous Wakefield quality line. They are known wherever cars, trucks, bicycles or motorcycles are used.

Thirty years of service tests have but added to their reputation.

The Wizard is made of specially treated carbon steel. It has the correct balance, and made to last long in the hardest service.

Price $1.50 each. Each wrench thoroughly greased and packed in individual carton.

JOBBERS AND DEALERS: In the Wizard Wrench we again are able to offer you a tool that is wholly in keeping with all Wakefield products. A necessary utility wrench that through sheer merit will bring business to you. Our proposition and discounts at request.

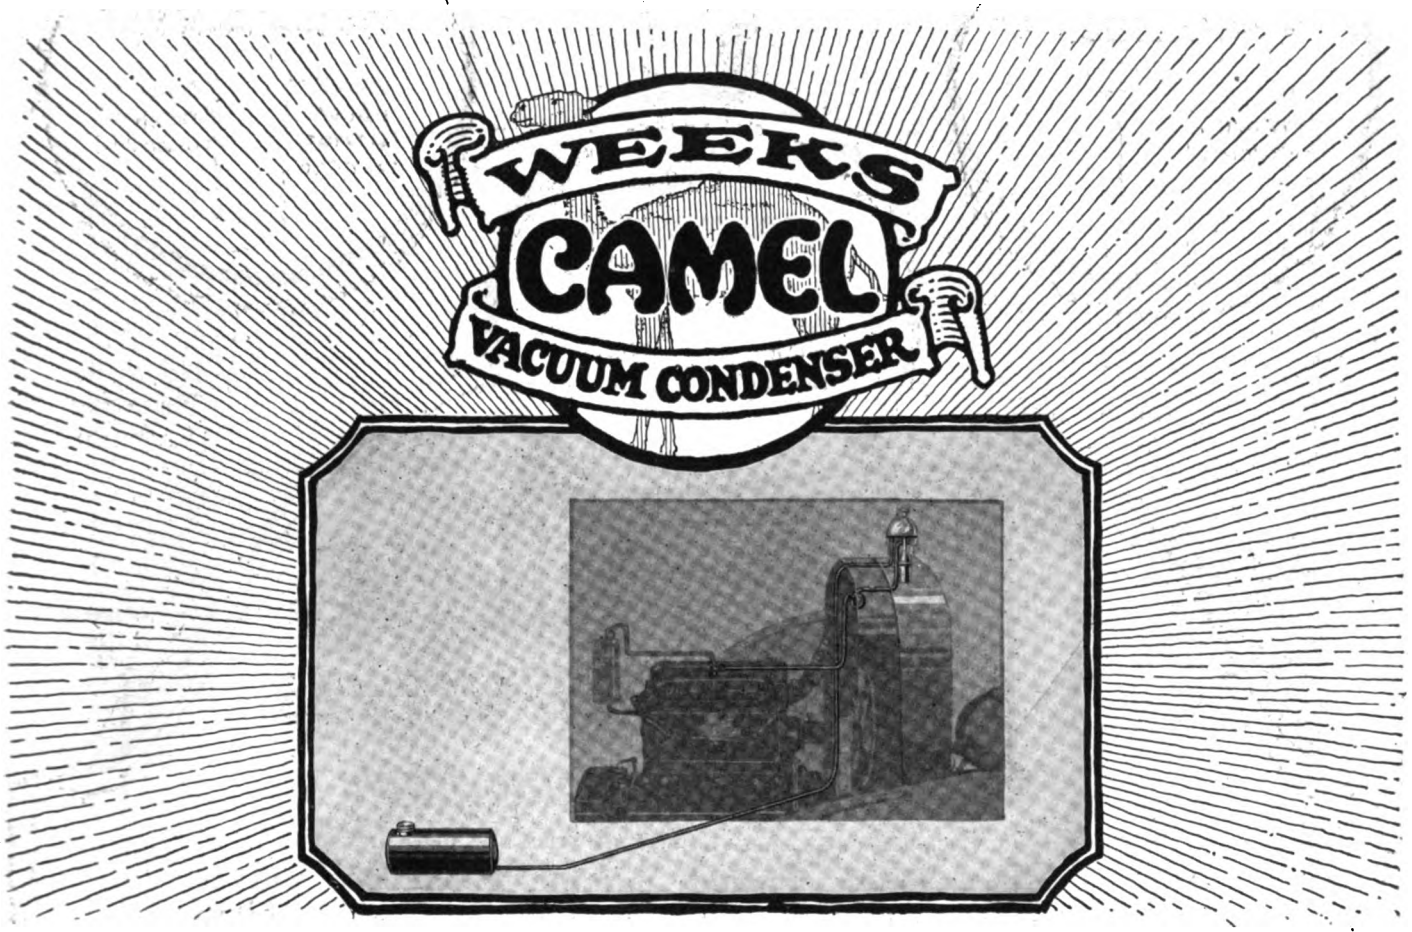
Five Thousand Miles—

On One Filling of Your Radiator

No Freezing
No Motor Troubles

Saves Money,
Time and Worry



The Weeks Camel Vacuum Condenser is the most efficient motor device on the market in helping motorists to enjoy the **full pleasure** of motor car driving. It is a simple little appliance which consists only of a tank which is permanently installed **in the motor** car, and which is connected to the overflow tube of the radiator; a vacuum valve which is installed in the top of **the radiator** connected to the intake manifold.

Water that is ordinarily lost by evaporation and overboiling through the overflow pipe is retained by the Weeks Camel Vacuum **Condenser** in the tank, and by the automatic action of the vacuum valve is sucked into the radiator, when, as and if needed.

Overheating, a common cause of motor troubles and big **repair bills**, is thus entirely eliminated, and the motor car can **be driven** for twenty weeks without a refilling of the radiator **being necessary.**

In the winter time this device renders a very material service **in that one filling** of anti-freeze solution is sufficient for an **entire season.** This effects a saving in an amount in most instances greater than the first cost of the device. This is a statement worthy of notice, when you consider motor cars require from five to fifteen gallons of anti-freeze solution at $1 a gallon and more.

Additional benefits derived are decarbonizing, gas saving and prevention of rust and encrustation in the radiator.

TO DISTRIBUTORS.

We are looking for responsible distributors in certain territories of the country to handle this efficient motor car device, and are ready to back them up to the limit with an intensive advertising campaign.

TO JOBBERS AND DEALERS.

Jobbers and Dealers are requested to write in for our proposition immediately.

Super Power

No Valve Grinding

Flexedge

SELF-SEATING LAMINATED VALVES

Sensible-Logical-Inevitable

A Valve-Seat Carbon Remover at Work While You Drive

5000 Dealers Have Tested Sample Flexedge Valves and Pronounced Them the Answer to the Carbon Problem

Immediately following the announcement of FLEXEDGE VALVES, we were flooded with orders for sample sets for test purposes. As a result, dealers and car owners all over the country have written to us stating that FLEXEDGE VALVES positively eliminate valve grinding and produce exceptional power and efficiency of motor operation. Naturally after our own preliminary testing we expected that a big demand would be forthcoming. Consequently we were prepared, and today we are filling orders from dealers in almost every hamlet and metropolis in the Nation.

FLEXEDGE CONSTRUCTION PREVENTS CARBON DEPOSITS

The FLEXEDGE principle is merely a slight flexation, which is so small as to measure only a tiny fraction of a thousandth of an inch, yet sufficient to gently scrape the valve seat, removing the tiny flecks of carbon, which collect after each explosion. FLEXEDGE SELF-SEATING VALVES continuously grind themselves, always seat. They are installed just like all other valves.

How many dealers have the vision

In every city or town there usually is one dealer with the vision and foresight to grasp a ***real*** opportunity—to see a profitable business built upon merit, service and performance. To these gentlemen, we offer exclusive territory and an attractive proposition.

The demand for MADISON TIRES is based upon proven superiority. They are hand-built in a 4-acre plant. We use more rubber, a higher grade of rubber, and the finest Sea Island fabrics: utmost care is observed during every process of construction: each MADISON undergoes a triple test. The result is a tire far above the average.

We have been in the rubber business since 1880. The superintendent, 15 years in charge of one of the largest tire plants. The laboratory chief is an authority on rubber products—a splendid organization ready to render 100% co-operation to MADISON dealers.

Will you join us?

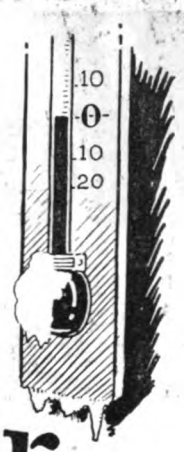
In Zero Weather Remember The COPLEY PRIMER



THE COLDER THE WEATHER THE BETTER THE COPLEY SELLS

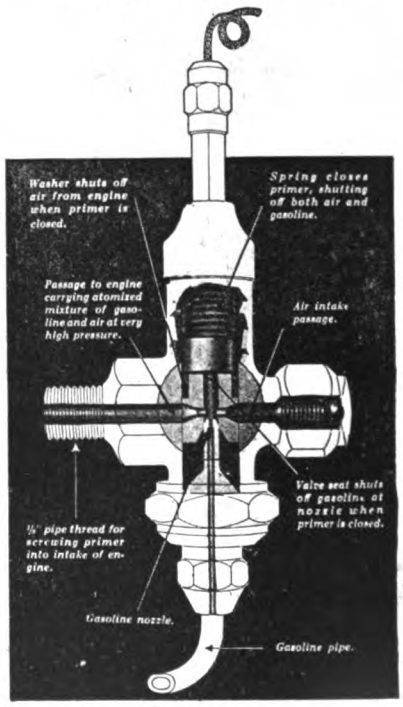
When you see a car or truck with a dead engine in a cold garage or on the road you can always count one more certain buyer of a Copley primer.

Burning up the batteries and back breaking cranking will not help. Cold weather and a poor grade of gasoline can beat any combination EXCEPT a Copley Primer.

WITH A COPLEY PRIMER ANY ENGINE CAN BE STARTED INSTANTLY IN ANY WEATHER AND WITH ANY GRADE OF GASOLINE.

The cost is small and the utility and service constant and positive. The Copley is easy to attach, requires no attention and affords results that make it a real car necessity.

Every Copley user is a booster. Every sale brings new customers. It is a business builder and a money maker for all dealers. It is easily the record selling item of the year.



Standard Equipment on Mitchell and Templar Cars

With a low grade of gasoline, it is almost impossible to start a motor in a cold garage on a winter morning or an engine when left standing long in the open. The present gasoline will not evaporate in cold air and there is no carburetor designed that will vaporize it.

When Copley equipped, the motor is turned over, either by hand-crank or starter, the suction of the engine draws a stream of air at high velocity through a small venturi tube, where it picks up a quantity of gasoline from a special nozzle. This mixture is converted into a rich, thoroughly atomized gas, which ignites in the cylinders as readily as the mixture in a warm motor.

Unlike other primers, the Copley Primer does not merely inject a small quantity of raw gasoline into the manifold. It not only fires the first cylinder that gets the charge, but is CONTINUOUS IN ACTION as long as it is held open, and will even run the motor without the help of the carburetor.

Write at once for our proposition.

List Price $6.00, including war tax.

AUTOMOTIVE MOSCO EQUIPMENT

FRONT APRON FOR FORD CARS

For 1917-18-19-20 Models Only.

This apron makes a wonderful improvement in the appearance of the Ford Car, and for that reason alone is worth the cost, but it does more than that.

IT PREVENTS MUD FROM CLOGGING RADIATOR.

ITS SHAPE INDUCES A LARGER VOLUME OF AIR TO PASS THROUGH RADIATOR AND REDUCES RISK OF OVERHEATING.

IT KEEPS LAMPS CLEAN.

IT PREVENTS VIBRATION OF MUD GUARDS.

Made of heavy steel, finished with two coats black enamel and baked. Furnished complete with bolts, nuts and washers. Easy to attach.

PRICE, $6.50 EACH. $7.50 WEST OF MISSISSIPPI RIVER.

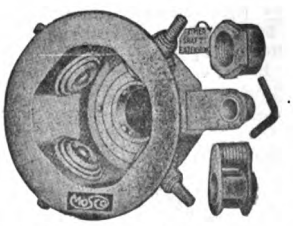
IMPROVED BEMUS BALL CONTACT TIMER FOR FORD CAR.

Is the IDEAL TIMER for the Ford high speed, short stroke engine, because form of contact is the only one which is correct both electrically and mechanically. Is made of a hardened tool-steel brush coming in contact with steel balls, are kept in proper position by means of a spring with plug on the end pressing against them. The impact of the brush causes the balls to turn so that a fresh surface is presented for each contact.

The brush comes in contact only with the four balls, touching no fiber or insulation. The balls are so located that each has a track of its own on the brush, insuring a maximum amount of wear.

MOUNTING is direct on the time shaft by means of an extension piece which is screw threaded on to shaft and runs in ball-bearing placed in recess of Timer's shell. RESULT—absolute precision of timing. Easier starting, smoother running, longer life and saves coil points.

EASIER STARTING—The chief cause of starting trouble in the Ford car is the presence of a body of hardened oil on the flat contact segments of the ordinary type timer. In the BEMUS the use of balls for contacts eliminates this source of trouble, as but little oil is used and the balls cannot retain more than the slightest film on their surfaces. Made of heavy nickel plated.



PRICE, $3.00.

MOSCO NO. 200 TIMER FOR FORD CAR.

Case is made of extra heavy pressed steel, finished in aluminum. Gray bone fiber raceway, with steel inserts dovetailed in. The threaded terminals are insulated by fiber washers through to contact points, thus removing cause of short circuiting.

PRICE, $1.50.

MOSCO FLOATING PLUNGER WHEEL PULLER.

Starts a "Frozen" or "Stuck" wheel instantly. Strike the plunger, turn the screw, strike again and the wheel comes off without injury to hub threads, spokes or axle.

Made for 200 models of 45 popular makes of cars.

AUTOMOTIVE MOSCO EQUIPMENT

BEAMOLITE SPOTLIGHT

The spotlight that sells at sight. Distinctive and an ornament on any car. Made for owners who seek the greatest utility and service.

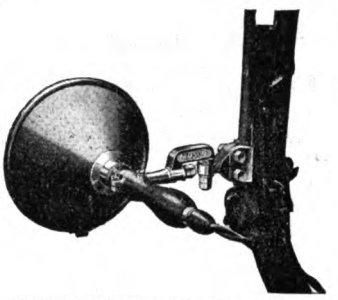
The bracket is of Universal type, made from non-rusting metal, heavily nickel plated and so designed and made that it "stays put" in any position.

The reflector is made of brass, silver plated, on nickel, and highly finished. It affords maximum lighting effect, and can be thrown in any direction (even backward).

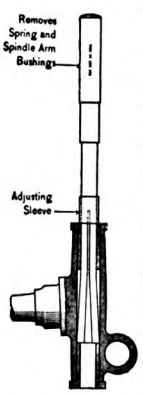
The focussing adjustment is simple and positive. The switch is of the lasting and practical type, and operated by a turn of the handle. The switch being placed inside of the handle, cannot be effected by water, dirt or weather.

It can be easily and quickly removed from the bracket when there is need of a trouble lamp. The bulb can be quickly replaced by removing the rim screw.

The Beamolite is custom made, quality equipment. Strongly constructed, giving a powerful light and so refined in appearance that it lends dignity to any car.



PRICE WITH 12 FT. HEAVY DUPLEX CLOTH COVERED CABLE, $15.00.



MOSCO JIFFY BUSHING REMOVER.

For Ford, Dodge, Dort, Chevrolet, Saxon, Overland and all Cars, Trucks and Tractors having ½" spindle bolt.

Made of steel, case hardened.
Indispensable to repairman and owner who does his own work.
Pays for itself in a few minutes.
The only tool now in use that will remove steering knuckle, spindle arm and spring bushings.

Price, $1.50.

"TUWAY" COMBINATION DASH LAMP AND PLUG SOCKET.

The "TUWAY" dash lamp affords a combination of refinement and utility. Its pleasing design makes it an ornament to any car, and the added advantage of giving a greater distribution of light from the same candle power bulb than any other lamp made. In addition it has the exclusive feature of a socket into which to plug trouble lamp, cigar lighter, etc., without interfering with the light of dash lamp.

The Tuway is made of brass heavily nickel plated and comes complete with bulb and all necessary screws, bolts and nuts for attaching to either wood or metal dash. This is a superior quality item, a sure seller and much in demand.

PRICE, $2.50 EACH.

ELECTRICAL FITTINGS AND EQUIPMENT.

In the manufacture of "Mosco" Sockets the tubing is swedged on. This eliminates all chance of the plug turning in the socket —a most common cause of trouble when ordinary methods are used. Our inspection and testing in the course of production insures perfect goods and the correct shipments made.

All "Mosco" electrical fittings are guaranteed not to "short circuit" or deteriorate in use of current up to twenty amperes and to afford every satisfaction in use for which they are made. With modern machinery and all time and labor saving equipment "Mosco" fittings are turned out in great volume and insures prompt service and delivery.

(Write today for the 1920 "Mosco" Catalog.)

Victor Gaskets Dominate

OUR recognized leadership in the automotive industry to-day is due to our policy of holding steadfastly to the original ideals of specializing entirely upon copper and asbestos gaskets for internal combustion engines.

To meet the constantly increasing demand for Victor Gaskets we have just completed the largest and best equipped gasket plant in the world.

This new home is not alone a measure of wonderful progress since we made the first copper asbestos gasket eleven years ago. It is our assurance to the trade of an even better product and a continuation of the high type of service which is responsible for Victor domination to-day.

National Shows Back on Peace-Time Basis

Prospects That New York and Chicago Exhibits Will Be Bigger and Better Than Ever Before--Passenger and Commercial Car Displays at Same Time

NOTHING is more significant of the sound readjustment of peace conditions throughout the automotive industry than the universal desire to make the big national shows this year the largest and most representative since the establishment of these exhibitions. Manufacturers are on the alert to take

Alfred Reeves, General Manager, N. A. A. C.

the utmost advantage of the present era of prosperity in the industry, but not satisfied with the present bright outlook they are wisely planning ahead for years to come, constantly improving their models in every way, enlarging facilities and advancing methods of manufacture and distribution with the one idea of increasing the efficiency of their products and to add to their appeal to the motorist.

This year, for first time at a national show, passenger cars and commercial vehicles will be exhibited simultaneously, but the latter will be housed in a building by themselves amply commodious to allow the space and attention to be devoted to them that their phenomenally increasing utility in the transportation field is demanding. And this new arrangement will also allow accessories and equipment to be collected and shown in conjunction with the various types of vehicles to which they more directly pertain, thus presenting a more complete and co-ordinated display more satisfactory to all interests.

Grand Central Palace, Where Passenger Cars Will Be Shown in New York City.

New York Show, Jan. 3-10.

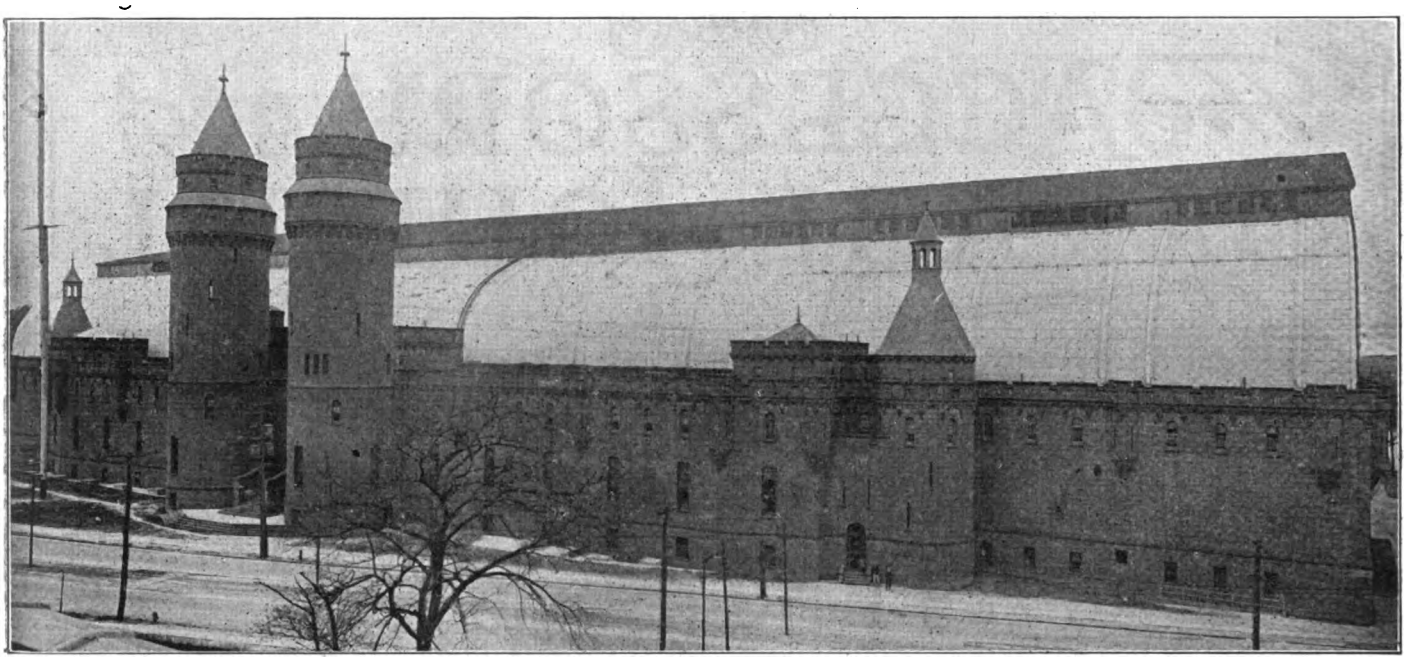
The New York show, which is the 20th event of the kind to be held in the Metropolis, is to take place the week of Jan. 3-10, and the passenger cars will be

S. A. Miles, Manager National Automobile Shows.

shown in the Grand Central Palace, while the trucks will be exhibited at the same time in a location further up town, the Eighth Coast Artillery armory. Accessories will be displayed at both places.

The early shows were held in the Madison Square Garden, and were in two periods, the first week being devoted to pleasure cars and the second, held in the same place, to commercial vehicles, motorcycles being com-

Digitized by Google



Eighth Coast Artillery Armory Where Commercial Cars Will Be Exhibited in New York, Jan. 3-10.

bined with the pleasure car section and accessories distributed between both shows.

Two Independent Exhibitions.

For a time there were two independent shows both at the same time; one, which had the sanction of the Association of Licensed Automobile Manufacturers, being held in Madison Square Garden. The other, which was in a sense an overflow of the Garden show, was presented in Grand Central Palace, but under different management and under the auspices of the American Motor Car Manufacturers' Association. The latter organization disbanded in the spring of 1910, as most of its members had affiliated with the Association of Licensed Automobile Manufacturers, but the Central Palace show was held the following season under the supervision of the American Motor Car Manufacturers' Exhibit Association. During the progress of this display the National Association of Motor Car Manufacturers was brought into being and future international exhibitions were seemingly assured by the taking of an option by the new association on Grand Central Palace for a series of years. This show was by no means at that time confined to automobiles, as a number of aeroplanes and aviation accessories shared with the motor cars the attention of visitors.

In 1912 the exhibits in both the Madison Square Garden and Grand Central Palace were combined under one management, S. A. Miles staging both events. In 1913 both shows were under the auspices of the Automobile Board of Trade, which had succeeded the licensed association. This show was held in two periods of one week each, the first being devoted to pleasure cars and the second to commercial vehicles. Manufacturers of accessories made display both weeks, and in addition members of the National Machine Tool Builders' Association exhibited during the second week.

In 1914 the show was held in the Grand Central Palace alone and it was housed subsequently in that place until 1919, when that building had been taken over for war service, and the show went back to the Madison Square Garden. In 1915, as all foreign shows were omitted, the American events were of especial interest and this was shown in the fact that this display, as well as those in the two years following, were increasingly successful.

A Patriotic Display.

The 1918 display was the first one held while the country was at war, and it took on a decidedly patriotic aspect. At this time the majority of the exhibitors met the demand for the utility and serviceability of the motor car for transporting passengers, rather than as a purely pleasure proposition. There were seen none of the freakish or extreme type of bodies that had characterized previous exhibits.

In 1919 the National Chamber of Commerce recommended that no show be held, as the conditions were not deemed favorable for its success, but the New York Automobile Dealers' Association took the matter up and made plans for staging an exhibition independently.

It was decided to hold the event in two divisions, one going to the old quarters in the Madison Square Garden and the second division in the 69th Regiment Armory, the Palace not being available. The original design was to have passenger cars shown in both buildings and the trucks in Madison Square Garden. It was finally decided that during the first week passenger cars and accessories should be held in both buildings, but that during the second or truck week, commercial vehicles be shown at the Garden and Armory and accessories only at the Garden.

The last truck show sanctioned by the National Chamber of Commerce was held in 1913, since which time no commercial car exhibit had been held under its auspices. Last year trucks were shown and proved a very successful feature. This year the truck seems to finally have come into its own, as the commercial section is to exhibit coincidentally with the pleasure cars and under conditions which adequately recognize it as the important branch of the industry it has become.

Exhibits This Year.

The pleasure car division will exhibit this year again in the Grand Central Palace, whose facilities have proved so admirable for an event of this kind. The location of this building, as is well known, is particularly convenient for its

Map Showing Location of Eighth Coast Artillery Armory and Grand Central Palace Together with Connecting Rapid Transit Lines.

Digitized by Google

patrons, being on Lexington avenue, two blocks north of Madison Square Garden. It is a handsome 13-story structure and affords 120,000 square feet of floor space, well arranged for exhibition purposes.

The Eighth Coast Artillery Armory, which will house the commercial cars this year, is situated at Kingsbridge road and 194th street, and while its location may seem to be somewhat of an inconvenience on account of its distance from the section where the shows have always been held, it is reported, however, that the big structure, which is the largest armory in the country, is easy to find and may be reached by subway or elevated within 35 minutes from either Times Square or the Grand Central station. There are several possible routes, which do not involve more than the possible changing from one "L" or subway train to another, and Manager Miles is authority for the statement that he has made the trip frequently in less than 40 minutes by the slowest way.

The fact that the armory combines several valuable features for show purposes was held to counteract any inconvenience from its location. It measures 300 by 600 feet clear of pillars or posts. The great drill floor affords 150,000 square feet of unbroken floor space under one gigantic vaulted roof, while a large auditorium, seating between 7000 and 8000 people, will be available for the sessions of the transportation convention it is proposed to hold during the week of the show. Provision is also made for a suitable restaurant. Here for the first time in the history of these events will the commercial car interests have all the room needed for an adequate exposition of its utilities. The pleasure car section will incidentally have more commodious facilities for the exposition of its exclusive features.

The plan of holding both sections of the show simultaneously will result in the bringing to the show cities more representatives of the automotive industry during one period than ever before. Heretofore, dealers and out-of-town visitors have been compelled to make their rounds of the expositions cover two periods and in many cases, dealers found that other business interests made it impracticable for them to spare more than one week at the show centers. Under the arrangements prevailing at this show it will be possible to inspect the latest passenger cars and truck models, as well as accessories, during the same week.

Some Comparison of Exhibits.

While it would obviously be illogical to compare with previous events the number of exhibits made at last year's show, on account of the changed conditions under which it was held at that time, some statistics of events staged during the pre-war period as showing the rapid progress of the industry may be of interest. At the first show at Madison Square Garden in 1900 there were only 31 exhibitors of motor cars and motorcycles and 20 of accessories. And at that show, strange as it may seem in the light of present day exhibits, steam cars easily were in predominance, with a goodly number of electrics, while gasoline cars were a bad third. In 1912 it was reported

that 250 cars were shown by 70 different exhibitors; in 1915, 528 cars were shown by 81 manufacturers, there being six electrics and 249 motorcycle and accessory exhibitors. In 1917 there were 97 car exhibitors, 342 cars and chassis being shown, and 226 accessory displays; in 1918 some 400 cars were displayed by 86 American exhibitors.

This year Samuel A. Miles rounds out a score of years efficient management of the national shows at Chicago, and has directed every one in New York during that time with the exception of 1919, when the show was staged by a different organization. The knowledge that Mr. Miles has the management of all shows again this year is sufficient indorsement that both general arrangements and minutest details will be looked after with the same care and efficiency that have characterized the exhibitions in the past. Mr. Miles has arranged with John R. Eustis to serve as his assistant, and Mr. Eustis will have especial charge of the truck division and conference.

Truck Conference.

Plans for the Highway Transport conferences, which are to be held in conjunction with the national truck shows, indicate that they will be the most comprehensive and important yet held. The feature of these sessions will be the liberal use of illustrations both by stereoptican slides and moving picture films. The conference will be opened the evening of Jan. 3 at New York. The matters of highways and highway traffic, motor express operation and farmers' haulage problems will be among those discussed, together with subjects having to do with the actual operation of motor trucks.

During the remaining six days of the shows the afternoon sessions will be especially devoted to the interests of those engaged in the motor truck business from the standpoint of manufacturing, distribution and service, and at the evening sessions topics of particular import to truck owners and operators and shippers and others interested in transportation will be presented. However, all sessions will be open to the general public. On the closing day there will be a single joint session in the afternoon.

Automobile Makers to Dine.

One social feature that is usually anticipated during the course of the New York displays is the annual banquet of the National Automobile Chamber of Commerce. This will be held this year the evening of Tuesday, Jan. 6, in the grand ball room of the Commodore hotel. Besides the customary single speaker there will be other interesting features

EXHIBITORS AT NEW YORK SHOWS.

83 Passenger Cars.
65 Trucks.
2 Trailers.
2 Bodies.
267 Accessories.

Digitized by Google

this year, including the presentation of awards to individuals who have rendered important service to the industry during the past 12 months, and the production of an original play on timely topics in the industry written by Fred E. Dayton, vice president of the Ajax Rubber Co., and Henry Caldwell, automobile editor of the New York Herald.

With the additional accommodations that the ball room provides, it will be possible to care for a number of men connected with the automotive industry, aside from those who are affiliated with the National Automobile Chamber of Commerce. Balcony seats will be provided for ladies who wish to attend.

Features of Chicago Exhibition

Early in the history of the gasoline automobile Chicago began to play an important part in the development of the industry, and owing to its central location and its proximity to the biggest motor car manufacturing plants of the Middle West, the annual national show at this western metropolis has always had an importance apart from the big shows of the East. Dealers from the Central West, West, South and Northwest have always made the Chicago exhibition their point of rendezvous. The negotiations between manufacturers and dealers for the year's ousiness are consummated here, and new contracts made and new agencies secured.

As the Chicago show follows the New York display it is of course to be expected that many of the exhibits should be similar to a certain extent to those at New York, but Manager Miles has always provided an entirely different environment and decorative scheme for the western event to meet the tastes of a different clientele which attends the western event. The exhibits in number and variety have always closely approximated and sometimes even surpassed those at New York, as might be expected from the fact that Chicago is nearer the heart of the manufacturing end of the automotive industry.

The Chicago show was held as a unit when the eastern show was divided and held under the auspices of two separate associations, and the advice and efforts of Manager Miles to preserve the unity of the Chicago show and make it representative of the entire industry have always been successful and the wisdom of this course has been recognized.

Where Chicago Events Are Housed.

The Coliseum and Annex, which have for so many years been the scene of these annual events, are still retained this year to house the passenger cars and accessories, and the First Regiment Armory, across the street from the Coliseum, will also be utilized as an overflow for this division. In 1916 the show became of such proportions that four buildings were needed and the Greer building, adjoining the Coliseum, was used for several years.

When plans were matured this year to

hold the truck exhibition the same week as the passenger car show, it became apparent that larger accommodations than ever before would be needed to adequately house the commercial car division. This resulted in the leasing of the International Amphitheater for the exclusive showing of trucks and accessories. This building is located at Halsted and 42nd streets, and is the scene of the annual stock shows, the horse shows and other events of a similar nature for which Chicago has been famed for many years past. The International Amphitheater consists of a main arena and two wings. It is possible to obtain at this structure and its adjoining buildings as much space as at the armory, but excluding the less desirable space, some 120,000 square feet will be utilized, and ample space is still available should conditions demand an overflow. The Amphitheater is readily reached by the elevated road from the center of the city in about 20 minutes, and there are ample transportation facilities from other parts of the city.

Date of Chicago Show.

This will be the 20th annual exhibition at Chicago and it will be held the week of Jan. 24-31, both pleasure car and business car divisions being held simultaneously. This also marks Mr. Miles' 20th consecutive season as manager of this event.

In 1900 Mr. Miles became an enthusiastic member of the Chicago Automobile Club. The side exhibit of motor vehicles in connection with the annual bicycle show in New York in 1899 had awakened the interest of manufacturers and other allied interests in the East, and Mr. Miles became convinced that something of this nature would appeal to the residents of the Middle West. The Chicago Automobile Club agreed to assist him in the enterprise and the Coliseum was engaged. Later in the year the club, however, evidently began to doubt the probable success of such an affair and Mr. Miles was left to conduct the matter personally. How well he succeeded is now a matter of history, but it may be surmised from the fact that when the National Association of Automobile Manufacturers was organized he was selected as general manager and he has since devoted his attention to the production of these big shows in New York and Chicago.

EXHIBITORS AT CHICAGO SHOWS.

85 Passenger Cars.
57 Trucks.
2 Trailers.
1 Body.
201 Accessories.

Truck Conferences Also at Chicago.

As at New York, the highway transportation and motor conferences will be featured in connection with the Chicago show, the same general plan to be followed at the latter, but with a change in some details of the programme. The

Digitized by Google

conference will open the evening of Jan. 24 in Chicago, with an important inaugural session, in which men of national reputation are expected to participate.

During the progress of the show meetings of the National Automobile Dealers' Association, the Chicago section of the Society of Automotive Engineers, and the Motor and Accessory Manufacturers' associations are held.

The following pleasure cars will be exhibited at Chicago alone: Leach, Monroe, Pilot.

Trucks to be seen only at Chicago: All-American, Armleder, Dependable, Hendrickson, Kalamazoo, Parker, Patriot, Service.

The Fruehauf trailer will also be seen only at Chicago.

ANNUAL SHOW DIRECTORY.

The Sixth Annual Directories for the New York and Chicago national automobile shows are being prepared by F. Ed. Spooner, 420 Book building, Detroit, editor of the Automotive World department of the Detroit Free Press. The Free Press issues these directories annually for the benefit of the exhibitors and all visitors of the automotive industries at the national shows. In addition to the features which have been carried in previous years there will be added for the 1920 national shows a department containing the names of visiting automotive dealers and distributors from the entire United States, the names of firms and their representatives.

The Annual Directories will include a list of all hotels in each city, with address and telephone; the events scheduled for the week; the calendar of the show circuit; newspaper and automobile editors present; scheduled headquarters of all prominent companies; names of advertising managers and their headquarters; names of national associations and their officers; and the names of all companies, whether exhibitors or not, in the automotive field, with the names of the representatives and their stopping places.

Mr. Spooner wishes to emphasize the necessity on the part of all concerns or individuals affiliated with the automotive industry who desire to be included in this directory, of sending in names, addresses, etc., at the earliest possible date as, on account of the size of the compilation, lists received late will necessarily be omitted.

BUSY DAY IN TRAFFIC COURT.

All traffic court records for number of cases in a single day were recently broken in New York, when 223 cases were heard before the magistrates assigned for disposing of such cases, the unusual number necessitating the attention of two judges instead of one as usual.

Offenders tried for speeding, first offense, numbered 116, 11 were arraigned for the second time for this offense, and the remainder of the cases heard were for minor violations of the traffic regulations.

KLAXONS FOR FORD CARS.

The Klaxon Co., Newark, N. J., has met the demand on the part of owners of Ford cars for a motor-driven horn, by placing on the market its new Klaxon Five Ford type, which is being distributed to dealers in all parts of the country.

The new horn is equipped with a bracket that fits readily on to the Ford engine, under the hood, and installation on the later Ford models, which are equipped with self-starters, is a simple matter and can be done by any owner.

ARMY AUTOS BRING $50,000.

The Motor Transport Corps of the United States army sold at public auction at Governor's Island Nov. 25, 55 motor vehicles designated as "unserviceable." The estimated total receipts were $50,000. A dozen touring cars and roadsters and 43 trucks were included in the sale, the selling price very nearly approximated the quotations on second hand cars in the commercial market it was reported.

LARGE GARAGE TO BE BUILT IN SALEM.

A large part of the old Salem Hospital land, Salem, Mass., has been purchased by the Goldberg Trust Co. of Salem, of which Max Goldberg is president, for the site of the largest garage on the North Shore. The area of land secured by the company is 40,000 feet, with a broad frontage on Derby street, and is situated on the direct line of all the heavy auto traffic between Boston and the North Shore. Building operations will be begun at once.

Almy, Bigelow & Washburn, owners of a big private garage opposite the hospital grounds, have plans for an addition to the plant, to be erected this spring.

MEMBERSHIP INCREASING.

The membership of the Motor and Accessory Manufacturers' association has been increasing at an unprecedented rate the past few months. The full roster now includes more than 360 companies, manufacturing motors, parts, tires and accessories for the automotive industry.

Big Aerial Exhibition at Chicago

Indications now point to the fact that one of the biggest aeronautical exhibitions ever held in the country will be seen at the Coliseum in Chicago the week of Jan. 8.

It will epitomize the progress that has been made in this and foreign countries in the science and application of aeronautics both during and since the close of the war. It will be largely educational in its nature, depicting the history of the airplane from its inception to its present development. It will undoubtedly include types of lighter-than-air-craft, as well as sea planes of various designs.

One of the purposes will be to show the utility of the modern airplane for the transportation of passengers and freight, especially its availability where quick service is the desideratum.

There will be included a representative display of aeronautical equipment and supplies, and the exhibition is receiving the sanction and support of the important manufacturers of these components, who are recognizing this as a wonderful opportunity for presenting their product to the general public from an educational standpoint.

One of the recent applicants for liberal space is the Goodyear Tire & Rubber Co., Akron, O., which built more than 1000 balloons for the government.

SHIPPING PISTON RINGS BY THE CAR LOAD.

A full car load, consisting exclusively of piston rings, was recently shipped from the plant of Foster, Merriam & Co., Meriden, Conn., to a single concern, this probably setting a record in the piston ring industry. This was accomplished in spite of the fact that a portion of the finished product which the company had on hand was somewhat damaged by a small fire.

The large, new addition to the foundry of Foster, Merriam & Co. is about completed and the new machinery will be installed so that the company, by the first of the year, will be making 100 different sizes and styles of piston rings.

This concern was the first in the United States to finish six-inch trench mortar shells for the government during the war. It was through the experience gained in work for the government that the company has developed the manufacture of articles in other branches which are now demanded, including piston rings for Liberty motors, which has led to its specializing in these goods for many other lines.

The Gayette Motors Corporation, Manhattan, New York City, has been chartered with $50,000 capitalization by A. Engelhardt, J. C. Grossman and S. Stein, 416 Fort Washington avenue, New York.

As a result of the demand for automobiles and tires the Fitchburg Yarn Co., Fitchburg, Mass., has its plant running to capacity making tire fabric.

Personal News of the Industry in Brief

Joe Spery, who is well known in the automotive industry, was recently put in charge of production by L. W. Wright, president and general manager of the Hooven Radiator Co., Chicago. It is reported that the business of the company has increased 300 per cent. since Mr. Spery joined the Hooven company. He is a young man of energy and executive ability, and is an expert on tools, dies and special machinery, thoroughly understanding the advantages of labor saving devices and the designing and installation of such equipment.

Joseph Spery, Manager of Production, Hooven Radiator Co., Chicago.

President Wright is a firm believer that the production end of any business is the foundation upon which the entire organization depends, and the Hooven company is leaving no stone unturned in the way of improved machinery, dies, etc., to enable it to meet the increasing demand for Hooven radiators.

J. M. Stockfisch, formerly associated with the Tide Water Oil Co., New York, has been made Chicago district sales representative for Pasco wire wheels, made by the National Wire Wheel Works, Inc., Hagerstown, Md. Mr. Stockfisch will have the states of Ohio, Indiana, Illinois, Kentucky, Wisconsin, Minnesota, Iowa, Missouri, North and South Dakota, Nebraska, Kansas and Oklahoma under his jurisdiction. He is widely known in the automotive industry, being a prominent member of the S. A. E.

Harry S. Buzby, who for 12 years was connected with the staff of the Chilton Co. and W. Cortez Raughley, formerly automobile manager of the Philadelphia Public Ledger, and for the past five years connected with the Fletcher Co., have formed a partnership under the name The Buzby-Raughley Co., and will engage in advertising and merchandising.

Walter Y. Anthony has been promoted to be manager of the Packard Motor Car Co. of Philadelphia, to succeed Lee J. Eastman, who was recently elected president and general manager of the Packard-New York Co. Mr. Anthony became affiliated with the Packard company in 1909 and has always held positions of responsibility in the organization.

J. H. Browning, for 2½ years manager of the Buffalo, N. Y., branch of the Buick Motor Car Co., has been promoted to the position of manager of the Milwaukee, Wis., branch. Mr. Browning's successor at Buffalo is Charles L. Fletcher of that city.

C. W. Curtiss has resigned his position as director and general manager of the Splitdorf Electrical Co., Newark, N. J., and is to take charge of the affairs of a large automobile accessory company with headquarters in Newark. R. W. Sutherland has been chosen to succeed Mr. Curtiss as general manager of the Splitdorf Co. and F. C. Manning becomes vice president and factory sales manager.

Henry M. Stanley has been appointed retail sales manager of Johnson Brothers, Inc., distributors for western Massachusetts of Auburn Beauty six-passenger cars and International motor trucks. Mr. Stanley has had an extensive experience in the automotive industry, having been recently with the Williams Motor Sales Co.

John B. Sopher, who was general manager for the Acason Motor Sales Co., Philadelphia, has been appointed district sales manager for the Acason Motor Truck Co., Detroit, with headquarters at Philadelphia. He will have direct supervision of all Acason sales organization from New York City to New Orleans, taking in every southern state east of the Mississippi river.

John B. Sopher, Southern District Sales Manager, Acason Motor Truck Co.

J. B. Childe, general manager of the Canton spring and forge plants of the Standards Parts Co., Cleveland, has been promoted to be general manager of the Perfection spring division. H. E. Clay succeeds Mr. Childe as general manager.

E. A. Shelly, who was engaged in sales promotion for a well known eastern truck company, is now connected with the home office of the Selden Truck Corporation at Rochester, N. Y., as assistant sales manager, succeeding C. E. Williams, resigned. Vice President Boulden, in charge of sales and advertising, has organized an advertising department that will be operated at the home office, and the sales department has been completely reorganized to meet the demands of the increased production under the new plan of operating.

E. A. Shelly, Assistant Sales Manager, Selden Truck Corporation.

R. E. Keller, who has for some time been prominently identified with the automotive publicity field, has organized the R. E. Keller Co., which will conduct an advertising agency with offices in the Otis building, Chicago.

Ernest H. Evans of the C. E. Fay-Allen Co. has sailed for Europe, where he will make a study of business conditions with a view of determining the advisability of opening a foreign branch for his concern.

George E. Blakeslee, president of the Crescent Automobile Co., Jersey City, N. J., has been elected boulevard commissioner for Hudson county. Mr. Blakeslee handles the Cadillac car and is one of the New Jersey Trade association, and is one of its board of governors.

Gilbert U. Radoye has been made director of advertising of the Haynes Automobile Co., Kokomo, Ind.

F. J. Druar of the engineering department of the Packard Motor Car Co., has taken over the duties of chief engineer of the Standard Motor Truck Co., Detroit.

Witney Wright has joined the sales department of the Philadelphia branch of the Locomobile Co. of America. Mr. Wright is a graduate of Harvard, class of 1915, and served during the war with the 111th Infantry, 28th division.

Goodyear's Most Successful Year

Reports made public at the annual meeting of the Goodyear Tire & Rubber Co., Akron, O., Dec. 1, showed that the past year's business was the largest in

L. C. Rockhill, Sales Manager, Goodyear Tire & Rubber Co.

volume and profits in the history of the company. Gross sales for the fiscal year ending Oct. 31 amounted to $168,914,982.83, an increase of $37,677,600.38 over the previous year. The net profits, subject to federal tax, were $23,277,245.29, as against $15.388,190.74 for the preceding year.

In his report to the stockholders President F. A. Seiberling stated that during the year both issues of outstanding preferred stock had been called for redemption and the authorized common and preferred capital stock of the company was increased to $100,000,000 each. It was also reported that of the new issue of preferred stock offered to stockholders and employees of the company, $41,135,900 had been subscribed by 30,409 individuals, representing every state in the Union, of which amount $7,843,600 was taken by 17,407 employees.

During the year subsidiaries of the company were formed as follows: The Goodyear Tire & Rubber Co. of California, $20,000,000 capital, and the Pacific Cotton Mills Co., $6,000,000. Plants of the most modern design and best equipment that years of experience can furnish are now being erected, the rubber plant to have a capacity of 7500 tires a day and the cotton mill 150,000 yards a week. The company plans to manufacture and distribute $250,000,000 worth of products during the coming year.

There are now on the pay roll 47,983 persons in its world-wide activities, including those at branch offices, the California and Canadian factories, the cotton mills at Goodyear, Conn., the cotton plantation in Arizona and the rubber plantations in Sumatra. Of these 28,681 are in Akron. The production of pneumatic tires has now reached 33,000 daily, but this large output does not supply demand.

At the annual meeting all of the directors were re-elected as follows: F. A. Seiberling, C. W. Seiberling, G. M. Stadelman, F. H. Adams, P. W. Litchfield, H. B. Manton, J. P. Loomis. The directors in turn organized as follows: President and general manager, F. A. Seiberling; vice president and manager of purchases, C. W. Seiberling; vice president and director of sales, G. M. Stadelman; vice president and factory manager, P. W. Litchfield; secretary and treasurer, W. E. Palmer; assistant secretary, W. D. Shilts; assistant treasurer, H. J. Blackburn; second assistant treasurer, H. H. McCloskey. The only changes in the personnel were the promotion of Mr. Palmer, formerly assistant secretary to the office of secretary in addition to his position as treasurer, and the election of Mr. Shilts to succeed Mr. Palmer as assistant secretary.

The Goodyear Tire & Rubber Co., Akron, O., has created a new office in connection with its activities, that of sales manager, and has appointed L. C. Rockhill to the position. This appointment, coming as it does at a time when the Goodyear company is able to announce the close of the most successful year in its already remarkable history, with a total gross sales of almost $169,000,000, will attract wide attention to the man who will direct its future sales policies. Mr. Rockhill has been with Goodyear over 12 years, previous to which time he was in the advertising department of a Cleveland newspaper. His first service was in charge of the repair department, which was a sub-division of the tire department, handling repairs and adjustments. He was successively made manager of the aeronautical and automobile tire departments and assistant sales manager in charge of tire sales.

Mr. Rockhill's advancement is in line with the Goodyear policy of recognizing ability among its employees.

C. R. Lester, Manager Technical Department, Packard Motor Car Co., Detroit.

Nicol Manager Garford Chicago Branch

Grant C. Nicol, who has been identified with the power truck industry in Chicago for a number of years, has been made manager of the Chicago branch of

Grant C. Nicol, Manager Chicago Branch, Garford Motor Truck Co.

the Garford Motor Truck Co., assuming the duties of the position Nov. 1. He succeeded George Crane, who resigned after an association of several years with the company. The management carries with it supervision of a dealer organization in Chicago territory.

BENDER JOINS C. A. S. CO.

John L. Bender has resigned his position as sales manager of the Anderson Forge & Machine Co. and has joined the C. A. S. Engineering Co., Detroit, which concern has just completed arrangements to represent the Pollak Steel Co., operating plants at Cincinnati and Marion, O., and Chicago.

The Pollak company produces light and heavy forgings for the automobile industry, heavy forgings for locomotives, engines, machine and marine service, industrial forgings of all types, hammered, pressed or drawn; also rolled products, including angles, shapes, tees, merchant bars, concrete bars, etc.

The Pollak Steel Co. has had 54 years of practical manufacturing experience, and recently entered the motor car field with a new forge plant at Chicago.

KELLY-SPRINGFIELD INCREASES COMMON CAPITAL.

Stockholders of the Kelly-Springfield Tire Co. have voted to increase the authorized common share capital from $5,029,000 to $10,000,000. The increase is for the purpose of distributing common stock dividends. It was also voted to authorize a decrease in the authorized preferred stock from $3,990,300 to $3,900,300.

Cashin Acason's Advertising Manager

J. G. Cashin, who was for a considerable time associated with the Standard Motor Truck Co., Detroit, as advertising manager, has joined the Acason Motor Truck Co. of that city in a similar capacity. He succeeds Donald F. Whittaker, who had served in the dual capacity of advertising manager and assistant sales manager, who has been made assistant to Vice President and Director of Sales Harry A. Conlon, and will now devote himself exclusively to sales and sales promotion.

J. G. Cashin, Advertising Manager, Acason Motor Truck Co.

Charles E. Fay of the C. E. Fay-Allen Co., Boston, Ford distributor, has been elected president of the board of directors of the Watertown, Mass., Co-Operative Bank. Mr. Fay is also on the board of directors of the Back Bay National and Back Bay Co-Operative banks.

W. H. Nash, formerly in the sales department of the Timken-Detroit Axle Co., at Detroit, has accepted a position as sales manager of the Beaver Manufacturing Co., Milwaukee, Wis., manufacturer of a four-cylinder tractor engine and a six-cylinder passenger car engine.

P. V. Sullivan has been promoted to the position of sales manager for the Mitchell-Lucas Co., distributor of Mitchell automobiles.

George E. Twitmyer has been appointed general sales manager of the Stevens-Duryea lines at Chicopee Falls, Mass. Mr. Twitmyer has been at the executive offices of the Peerless Motor Car Co., Cleveland, O., where he was favorably known from his many years association with that company.

Everett S. Cameron has returned to the automobile manufacturing industry as president of the Cameron Motors Corporation, West Haven, Conn., and will again place the Cameron car on the market, the production of which was interrupted by the outbreak of war.

R. W. Knox, formerly advertising manager of the Columbia Graphophone Co., and previous to that in the advertising departments of the Loose-Wiles Biscuit and American Chicle companies, has been appointed by Harry S. Houpt, president of the Hudson Motor Car Co., Detroit, to promote an intensified plan of publicity and sales for the coming year in behalf of the Hudson and Essex cars.

Alexander W. Barber, formerly connected with the credit department of the Irving National Bank of New York, has been appointed a field secretary of the Motor and Accessory Manufacturers' association, by M. L. Hemingway, general manager of the association. By training and experience Mr. Barber is unusually well qualified for his new work, as when with the bank he handled many of the important accounts with the automotive industry and prior to his connection with the bank he was a member of the inspection department of the New York Life Insurance Co.

Pickens is Selden's Advertising Manager

The Selden Truck Corporation, Rochester, N. Y., has established an advertising department within its organization which has been placed in charge of J. E. Pickens, who was for nearly five years assistant advertising manager for the Federal Motor Truck Co., Detroit. Previously the advertising for the Selden company was handled by the agency having the Selden account, but the nation wide distribution of Selden trucks necessitated a change in the policy. In addition to directing the advertising, Mr. Pickens will also edit "Transportation," a publication that will be produced by the Selden company for the purpose of promoting power highway haulage.

J. E. Pickens, Advertising Manager, Selden Truck Corporation.

Arthur A. Roelofs has been chosen as special representative in the Middle West for the Precision and Thread Grinder Manufacturing Co., Philadelphia.

Ralph C. Roguon, President, Automotive Service Association, New York, N. Y.

L. M. Field, Pacific Coast Representative, Selden Truck Corporation.

H. W. Drew, Assistant Manager, Technical Service Department, Packard Motor Car Co.

Briggs is B & W Co.'s General Manager

The B. & W. Manufacturing Co., Chicago, manufacturer of radiators for the automotive industry, has made great strides since it was incorporated in January. The first radiators were shipped in June and since then orders amounting to over $750,000 have been written.

S. D. Briggs, General Manager of B. & W. Manufacturing Co.

The factory in Chicago is now turning out an average of more than 300 radiators per day. General Manager S. D. Briggs states that every indication is for increased production in 1920. All manufacturers now being served by the company have indicated their intention of increasing their orders after Jan. 1.

The company is planning to increase its production to 600 radiators per day beginning Jan. 1, and, from all indications, will on that date have sufficient orders booked to carry it throughout the year.

B. J. Grigsby, vice president of the Anderson Electric Specialty Co., is now in London and Paris in connection with the distribution of the company's products in those countries. Mr. Grigsby is well acquainted with the possibilities of these markets from his former connection, for 10 years with the automobile and electrical manufacturing concern of Benjamin Electric, Ltd.

U. S. Johnson, long and familiarly known to the trade from his connection with the Motor Hardware & Equipment Co., San Diego, Cal., has severed his connection as sales manager with that company and will join his brother, C. E. E. Johnson, to establish a manufacturers' agency under the name of U. S. & C. E. E. Johnson, and will specialize in the Pacific coast jobbing trade.

C. S. Hyman, recently returned from overseas and formerly with the Campbell-Ewald Co., has been appointed advertising manager for the Standard Motor Truck Co., Detroit.

William McDonnell, formerly connected with the American Ice Co., and Alexander Saburn, recently with the Franklin car agency, Atlantic City. N. J., have taken over the agency for the Holmes air cooled car for that territory. The new concern will maintain a Holmes service station in addition to taking on the sale of the cars.

Emlen S. Hare, who recently resigned as vice president of the Packard Motor Car Co., has become president of the Mercer Motors Co., which has acquired the stock of the Mercer Automobile Co., Trenton, N. J. Henry Lansdall and G. L. Guyman also go from the Packard company to the Mercer company with Mr. Hare, the former as vice president in charge of sales and advertising.

F. H. Kueck, who recently completed a drive from New York to Los Angeles, Cal., in a Nash six, reports that his average for the distance, 4154 miles, was 14.4 miles to a gallon of gasoline.

Harry Lozier, formerly head of the Lozier Motor Co., Detroit, and the Hal Motor Car Co., Cleveland, is now in charge of the distribution of Chandler cars at Albany, N. Y.

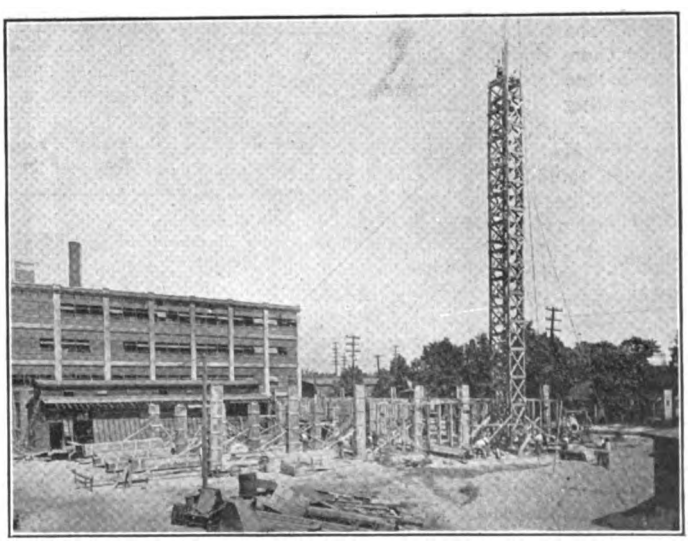
Lester George Provo, assistant to the sales manager of the Packard Motor Car Co., Boston, was married recently to Mrs. Minnie Haas Kattell, daughter of George Haas of Clayton, N. Y., at the Hotel Brunswick in Boston. Mr. Provo was a member of the United States Medical Corps during the war.

PISTON RING CO. EXPANDING ITS MUSKEGON PLANT.

The Piston Ring Co., Muskegon, Mich., which claims to be the largest manufacturer of piston rings in the world, is erecting an addition to its plant, now being constructed by the National Construction Co. of Detroit and Muskegon, which will, when equipped, bring the production up to more than 125,000 rings a day. The demand for its products has necessitated this expansion, the second made in a few years. The company expects that the new plant will be operating before the end of the year.

The company produces piston rings for automotive engine, pump and compressor manufacturers, furnishing angle jointed, lap joined or specially designed rings to meet any requirement, and the production is now considerably in excess of 1,000,000 a month.

The rings are made from a tough, close grained gray iron that is subjected to laboratory analysis before and after casting, and plant is equipped with much special machinery.



Constructing the New Plant of the Piston Ring Co., Muskegon, Mich., to Meet the Demands of Greatly Increased Business.

Williams Joins Sanford as Sales Manager

Announcement is made by the Sanford Motor Truck Co., Syracuse, N. Y., builder of Sanford trucks, of the appointment of C. E. Williams as sales manager. Mr. Williams was for a considerable period associated with the Selden Truck Corporation and the Selden Truck Sales Co. as assistant to Hal T. Boulden, the director of sales and advertising. He is well known in the industry and to the trade and by training and experience is well qualified for the supervision of the sales organization of the Sanford company.

C. E. Williams, General Sales Manager, Sanford Motor Truck Co.

H. Guy Grimmel, formerly with the Baltimore office of the Holbrook Auto Corporation, distributor of Allen cars, has gone to Washington, D. C., as manager of the branch of the Holbrook Corporation in that city.

TRUCK TIRE SERVICE AS A BUSINESS

Station with Practical Equipment and Good Management Developed to Be the Largest in New England in Less Than Three Years

Drivers and Owners at the "Conservation Day" Gathering at Feltham's Truck Tire Service Station, an Event Planned to Advise Them of Practical Tire Economies.

TIRE service keenly concerns every owner of power trucks. The time of a truck has distinct value and any period that is not productive results in a loss that cannot be compensated. The owner may, provided that the number of machines shall justify, provide for tire changes and repairing, but this will necessitate initial investment for shop equipment and tires, the use of capital and the employment of men, and unless the fleet is of such proportions that the employees shall be constantly working a tire maintenance department will be an extravagance and not an economy.

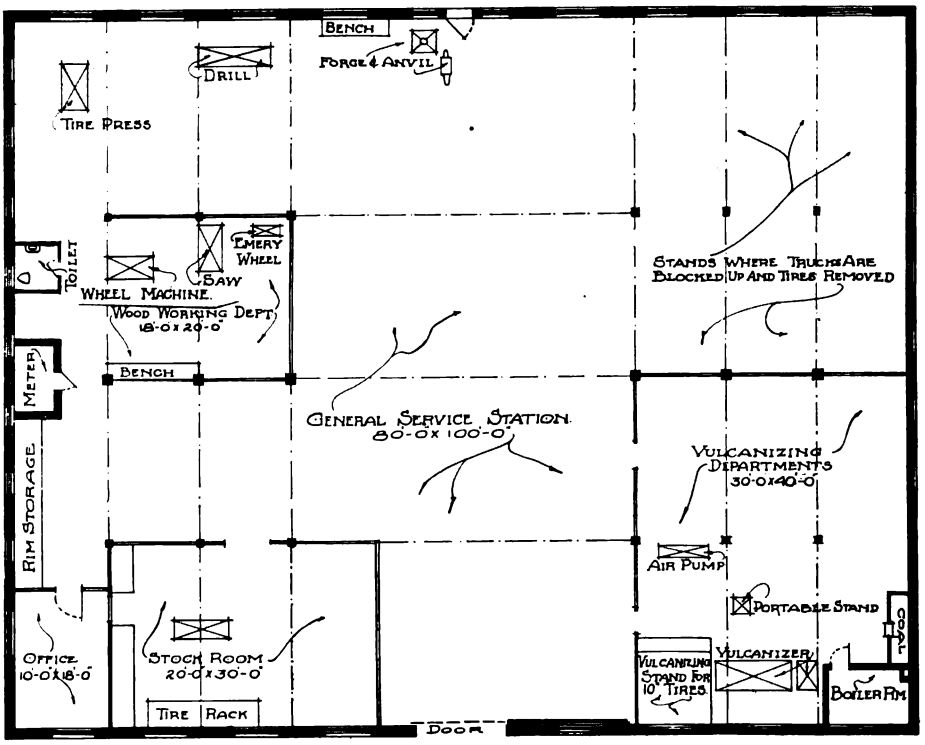
The tire service station must, as does the mechanical service station, specialize this work. There are thousands of tire repairers, many of them operating in a small way and handling passenger car tires solely. Some of the repair men have expert knowledge, having had factory experience and frequently thorough training. The number of truck tire service stations is comparatively few, however, due first to the fact that with very limited equipment a shop for car pneumatic tire repairs can be established; second, that cars vastly outnumber trucks and the possibilities for business are believed to be greater; third, that the repairing that can be done with solid tires is not of a character that earns considerable revenue, and fourth, the equipment necessary for a truck tire service station is costly and considerable initial investment is necessary.

There is every reason to believe, however, that from now on the tire station that is equipped to afford tire service for trucks will have a very satisfactory and remunerative business, and the possibilities are exceptionally attractive. The number of trucks in use is increasing very fast and though there is no probability they will be as numerous as passenger cars, the character of service is entirely different and ought to be very profitable.

An Exclusive Truck Tire Service.

This story has to do with the establishment and development of a tire station that was until recently given over exclusively to truck service. It has in 2½ years become the largest station of the kind in New England in point of facilities and equipment, and has become very profitable. Because of the increasing use of pneumatic tires for trucks of small size it now affords service shoes of this type for passenger cars as well, and does all kinds of repairing and restoration.

But its business is first of all with truck tires. There is no doubt of the growth of patronage and it is enduring because of the satisfaction that it insured to its patrons. The station was established by a truck tire salesman, who was attached to the Providence, R. I., branch of the Goodyear Tire & Rubber Co. for five years and in 1913 he won a gold medal offered by the company as a 100 per cent. efficiency man. He re-



Floor Plan of Feltham's Truck Tire Service Station, Showing the Arrangement of the Different Stock and Work Departments.

Digitized by Google

signed Oct. 31, 1916, and the following morning established his present business, beginning with desk room in the sales rooms of the Federal Motor Truck Co. of Rhode Island, and April 1, 1917, he leased the station he now operates at 76 Branch avenue, Providence.

The building is brick, a single story, 80 by 100 feet, mill construction, and was originally built for mill storage. It has a yard of 16,000 square feet that is available for expansion or outside storage. The building is high studded and well lighted, with an entrance at the center of the front, which is advantageous for the layout of the several departments of the station. Reference to the accompanying plan of the floor of the building as it is utilized is interesting.

The location is well removed from the business center of Providence and Mr. Feltham was advised that the location would militate against business development, and especially against transient patronage, but the building is not too large for his requirements. One object was to have sufficient floor area so that the trucks could be worked on sheltered instead of in the open air. and convenient to the several departments to minimize labor and time, and there is little doubt that the size of the building has been an economy in more than one way, especially in cold weather.

Arrangement of the Departments.

Entering the structure at the left is the tire stock room, which is separated by half partitions with a sliding wire grating door, which is 20 by 30 feet, and beyond this in the corner is the office, 10 by 18 feet. Next beyond the office is the rim storage racks and bench, the meter room, the lavatory, and in the further corner at the left is the tire press. Arranged along the rear wall, extending about half the length of the floor, is the drill press, bench, forge and anvil. In the center of this section of the floor is the wood working department, which is 18 by 20 feet and is equipped with a wheel machine, band saw and grinder.

At the right of the entrance is the vulcanizing room, 30 by 40 feet, and beyond this are the stands for trucks that are in the station for work, and further on is the storage space for tires and rims removed from trucks and which will be sold for "scrap." The center of the floor is open and clear of posts and this is utilized moving trucks in and out and occasionally for work if the truck stand is filled.

This space is 37 by 70 feet and a part of this and the area now used for old tire storage could be devoted to additional equipment if this is needed with the development of the business.

In the stock room is a show case in which is displayed tire accessories. On two sides of the room are racks in which are kept all sizes of truck and passenger car tires. In truck tires, solid bands, the range is from 32 by 3½ inches to 41 by 12 inches; in cushion truck tires from 30 by four inches to 36 by five inches; in cord truck pneumatic tires from 36 by six inches to 42 by nine inches; in passenger car pneumatic tires, both cord and fabric, from 30 by three inches to 37 by five inches, and in industrial truck solid band tires from 10 by three to 20 by five inches. All the tires are Goodyear products and the stock will range in value from $25,000 to $30,000.

So far as is possible all sizes of tires and pneumatic tubes are stocked, so that practically any requirement can be met.

The station is also stocked with all sizes of S. A. E. bands, so-called, these being the steel rims that are pressed on the felloes of all wheels on which demountable pneumatic tires are mounted, quick detachable and demountable rims for passenger car wheels, wheel flanges for cushion tires and rims for truck pneumatic tires.

The shop equipment of the station is exceedingly complete and was determined with a thorough knowledge of the requirements for the work. None of the machines is duplicated, but the system is such that the work is progressively

(Continued on Page 56.)

System for Handling Charge Accounts

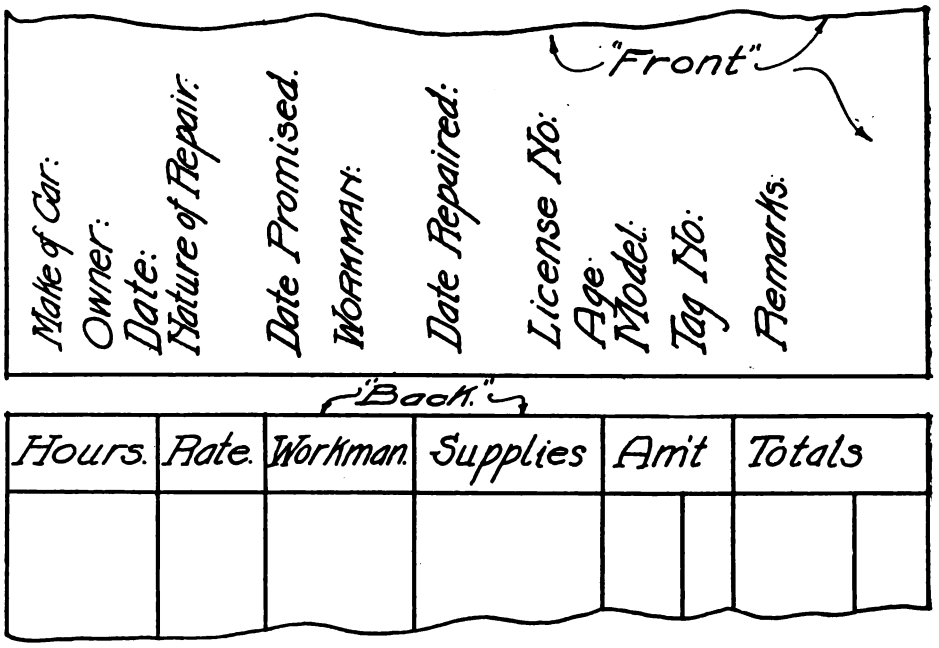
By Walter Engard.

THAT credit is a mighty force in modern business requires but little proof in view of its extensive use by retail merchants, automobile dealers, wholesalers and manufacturers the world over. That, as a matter of fact, it is an indispensable element in our present day commerce cannot be denied. Fully 90 per cent. of the business of this country is carried on by credit. Its application to the retail business is almost universal. And, while the credit business has some disadvantages, the real advantages of the credit business outweigh the disadvantages two to one in favor of credit.

Retail credit has come into disrepute because of the fact that it has not been adequately controlled. Business men have been too easy in the extending of credit. They have extended credit without the necessary facts upon which they could intelligently base the advisability of credit; in other words, they have extended credit in many cases where they would not for one moment think of extending a minor loan. They have been too lax in their methods of keeping books and entirely too lax in their collecting methods.

Credit, when handled through the proper system, is a mighty business builder. Credit, as a usual thing, appeals to the better class of trade than the cash method. Credit binds the customer closer to the house extending him credit, and also brings the customer back with a greater degree of regularity.

Credit enables the merchant to extend his business dealings to a greater extent than he could through the strictly cash basis, resulting in a much larger volume of sales, therefore more profit, even though he may suffer a few losses through bad accounts.



For illustration, let us say that through a strictly cash system the merchant does an annual business of $75,000 upon which he realizes a net profit of five per cent., or a total of $3750. Now, if that same merchant by doing business on a credit basis can increase his business from $75,000 to a volume of $150,000 yearly, and by using a proper system of extending credit and a systematic method of collecting his accounts--his loss should never be as high as one per cent., and this percentage would be high under a proper system—he would still have a gain of $2250 in net profits, or the difference between five per cent. net profit on $75,000 and four per cent. on $150,000

In view of these facts the retail automobile merchant may do well to encourage credit business. This may be a bold system, yet nevertheless true.

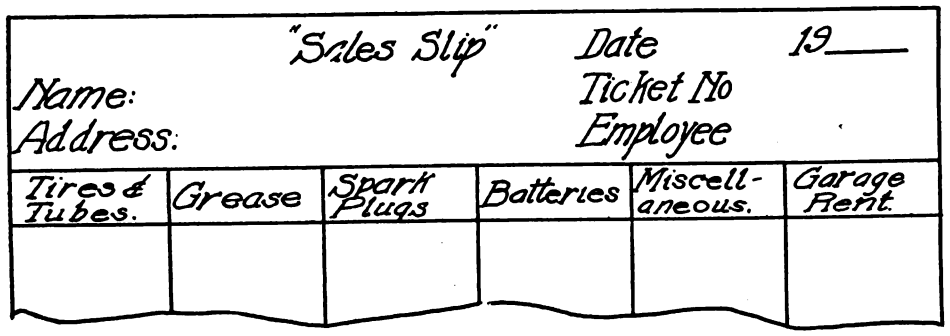
Value of a Credit System.

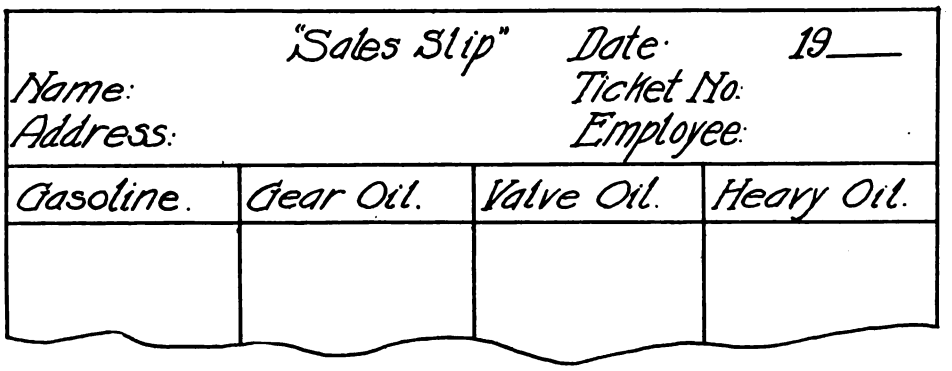
But the purpose of this article is not to discuss the advantages or the disadvantages of the credit business, but rather to place before the auto dealer and the garage man methods whereby he can conduct his business upon a more profitable basis and speed up collections. As all have to do business on a credit basis the information presented should be of decided value.

There is but one right way to do a thing, and there is but one right way to install a proper credit system and that is to start right at the bottom and build up. Therefore, the very first thing for the dealer to do is to see that every article of stock is provided with a price ticket, upon which can be entered the name of the article, the manufacturer, the cost, the selling price, to whom sold and by whom sold. These tickets should be in the form of shipping tags and should be placed on every article of size, such as machines, tires, jacks, tools, etc. For smaller articles, such as spark plugs, piston rings, etc., a small sticker may be used.

In the repair and garage department a shipping tag ruled and printed in such a manner as to accommodate the entering of the name of the car, the name of the owner, the name of the workman, the date the car was brought in and the day repaired. The reverse side of this tag should be so ruled as to allow the entering of the labor, material, etc., used in making the repair. (Note illustrations of both shipping tags.)

Sales slips should be provided upon which the employee making a sale or repair may enter the date, the name and address, and the article or articles, etc.,





Digitized by Google

Foreman.

which are to be charged to the customer. Three separate sales slips should be provided, one for the purpose of recording all sales of supplies, one for sales of gasoline and oils, and one for recording repair work and garage rent. (Two of these tickets are herewith illustrated.)

Sales Slips as Reference.

When an employee sells supplies or gasoline and oils or makes a repair on a car, he should fill out the proper sales slip and turn it into the office, together with the price tickets detached from the article sold if tagged. The bookkeeper will enter the charges on his ledger from the sales slips and then the sales slips and the price tickets should be filed for reference should occasion arise for their examination.

For the purpose of keeping these sales slips and price tickets on file for immediate reference, an index file system should be provided for each one. Both files should be four by six inches, as both the sales slips and the price tickets are this size. The index drawer for filing the price tickets should be equipped with guide cards running "A to Z" and should have a capacity of at least 1250 cards.

Additional drawers may be added as the business demands. As the price tickets come into the office the bookkeeper will file them in this index drawer behind the correct guide card. For instance, if the salesman sells an automobile to Oliver Summers he will detach the price ticket from the car and enter upon it the name of Mr. Summers and his own name, and, together with the sales slip, he will send both to the office and the bookkeeper will file the price ticket behind the guide card "S" in the index drawer.

Now should it become necessary to refer to the price ticket for the purpose of determining some fact, all that is necessary is to open the index drawers and behind the guide card "S" will be found the original price ticket as it was taken off of the car the day it was sold.

How to File Sale Slips.

The index drawer for filing the sales slips should be equipped with plain guide cards with one cut. The one cut style has a tab extending a little above the body of the card upon which may be entered the name of the customer behind which the sales slips of that customer are filed.

As soon as the bookkeeper has transferred the charge from the sales slip to the ledger sheet he will file the original sales slip behind the guide card in this index drawer bearing this customer's name. Whenever a new account is opened a guide card bearing the new customer's name may be added. The cards should be filed alphabetically, and more drawers may be added as the business demands.

With this system all sales can be traced back to the employees making them in case of any dispute. A customer may come in, after receiving his monthly statement, and state that there must be some error—that he did not buy an article specified in his statement on that date—that there must be some mistake in transferring the charge. All the book keeper needs to do is to refer to the sales slip index drawer and locate the original sales slip and, if necessary, he may tell from it the man making the sale and prove the correctness of the charge through him.

The advantages of having the price tickets and sales slips on file for reference are many and a great many disputes will be settled without difficulty and ill feelings.

The Ledger Accounts.

The next thing will be to provide a suitable ledger in which to keep the accounts. There are a great many systems of keeping accounts sold commercially, any if which is good, but for the auto dealer and the garage man I would recommend a loose leaf ledger system.

The ledger should be an extension post type allowing the insertion or removal of accounts without the necessity of a new ledger. Ledger sheets should be 11 by 11 inches, and so ruled as to accommodate the entering of the date of each charge, along with a description of the sale and the amount of the charge; also columns for entering the credits and balances.

Every ledger account should be kept in duplicate by providing a plain ledger sheet of the same size as the ruled sheet to be placed directly following the main ledger sheet of each account, so that by placing a sheet of carbon paper between the two sheets a duplicate of each account may be made.

By doing this the original ledger sheet may be used as monthly statements, thereby saving a great deal of time in getting out bills, and this will also insure an itemized statement for each customer. The duplicate will be retained as a permanent record in the ledger until the account is settled.

The Utility of Controlling Sheets.

There should also be a controlling sheet for each account. These controlling sheets should be placed in the front of the ledger and an index of them kept, facilitating the finding of the various accounts. The pages for this controlling sheet should be of the same size as the ledger page, but of a little heavier material, as they last for a considerable length of time, and if not of heavier weight will soon become worn.

These sheets should be ruled in the same manner as the ledger sheets with the exception that they will not bear the name of the business, but will be ruled

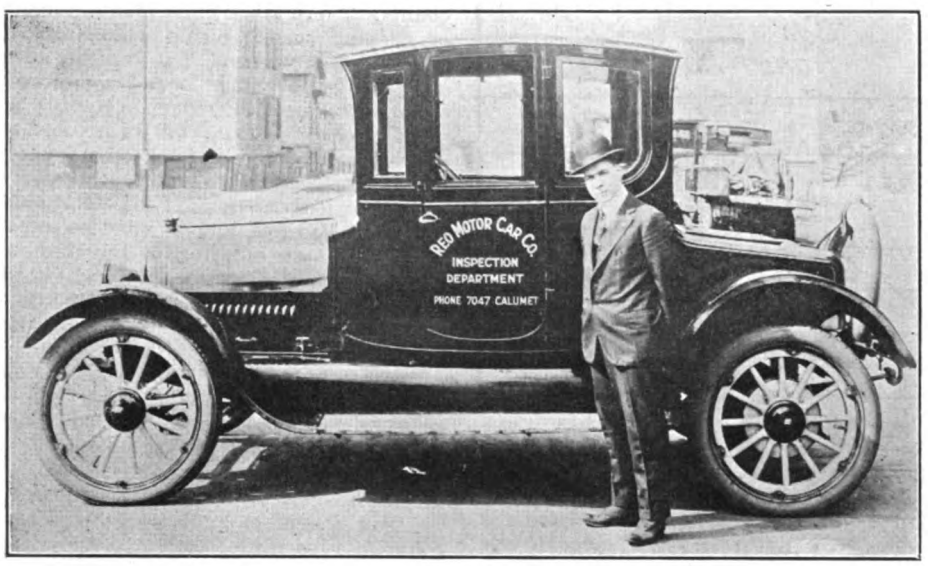
REO BRANCH GIVES EFFICIENT SERVICE



Walter Hoffman, the Capable Chicago Reo Service Man, and His Inspection Car.

"'IF IN Need of Help, Hail Hoffman,' is a slogan that is more than merely alliterative," says Major Harry Urwin, manager of the Chicago Reo branch. "We have found it has a tremendous merchandising value.

"If it is true that the satisfied customer is the best salesman, then I am justified in saying that this service slogan and what it represents, is one of our most productive factors.

"I don't mind telling the trade some inside facts about our methods, even though it be at the risk of others copying a plan that is so far exclusively our own. In fact I hope others will copy it because a dissatisfied customer injures all of us, regardless of what make of car he drives.

"Soon after taking charge of the Chicago branch I instituted the system of sending a competent mechanical man from the inspection department to voluntarily examine Reo cars wherever he finds them and advise owners if they are not running at top notch efficiency.

"This man's name happens to be Walter Hoffman, who has been with the Reo company 14 years, is thoroughly saturated with the Reo policy—Reo is his religion in fact—and he knows every nut, bolt and screw in every model the Reo company ever made.

"Moreover, he has a most pleasing personality.

"Hoffman has a Reo coupe which is comfortable, so that he can and does drive in all kinds of weather. In fact, bad weather is his best harvest time.

"He keeps everlastingly at it, calling on Reo owners in Chicago, which he has divided into zones so as to make it systematic and be sure that he will not overlook anyone.

"When he calls on a customer he presents his card and explains the object of his visit.

"For example: 'Good morning, Mr. Smith. My name is Hoffman, from the Reo inspection department. You have a Reo car and so far as the records at the service station show, you have not called on us for any help, aid or sympathy for quite a while, so in the ordinary course of my work I want to find out if your car is running all right and if you need any suggestions in regard to it. In fact, I should like to run it around the block and if you have five minutes to spare, perhaps you will go with me.'

"Usually Mr. Smith goes along and generally Hoffman will be able to make a few little adjustments—possibly to the carburetor, the cleaning of a spark plug or the tightening of a battery wire. It may be that it is a little more serious than any of those things. Perhaps one of the valves is sticking a bit or is not seating quite properly.

"Anything that Hoffman can do right then and there is done and everything else the owner may suggest—tightening spring clips or correcting other results of procrastination or neglect on the part of Mr. Smith himself.

"At the end of the day these inspections and adjustments are duly recorded on an inspection blank, which is turned into the service manager. Next morning the service manager writes to Mr. Smith and confirms what Hoffman has told him, incidentally quoting the report as to adjustments made and suggestions as to further work which should be done on Mr. Smith's car, ending the letter with the statement that of course there are no charges for Mr. Hoffman's services, inasmuch as that is part of our general service plan for keeping Reos out of the hospital.

"Sometimes Mr. Smith will, if he is not too busy, write us a nice letter of thanks for the courtesy extended by Mr. Hoffman—but even if he doesn't, we know how Mr. Smith feels about it and that another Reo booster is busy.

"Every owner in Chicago has received a card from us bearing a picture of Hoffman and the car in which he drives all the time. The card bears the suggestion, 'If you need help or advice, hail Hoffman.'

"As a result of this we frequently have calls by 'phone for Hoffman and in most cases we are able to give them the benefit of quick action.

"Hoffman starts out first thing in the morning and telephones the service station at 10 o'clock, 1 o'clock and 4 o'clock. This enables us to keep in touch with him while he is doing his routine work, and to tell him of any emergency cases.

"Another stunt, and one which has produced tremendous results, is his once-a-week trip to Grant park—the big space between Michigan avenue and the lake—where several hundred cars are parked all the time. The owners of these cars are nearly all in offices within a stone's throw of the parking place.

"Hoffman ferrets out the names of the various Reo owners from their license plates, calls them on the 'phone and notifies them that between 11 o'clock and 2:30 he will be at this spot so that, without loss of time, the owner can if he desires run over and have a little chat with Hoffman about his car.

"These are busy times for the Reo service man and the way owners avail themselves of the opportunity is the best evidence of their appreciation of the plan.

"Every Reo owner has come to enjoy an added degree of comfort from his driving of his car when he knows that in case he needs help, all he needs to do is to 'Hail Hoffman' and that the smiling service man will soon be on the spot."

PAID $16,000 FOR PARKING SPACE.

Tired of being haled into court by traffic policemen, for parking his car in public spaces beyond the legal length of time, Philip Rosenbach, art connoisseur of Philadelphia, has just paid $16,000 for a stable property near his place of business. Mr. Rosenbach was forced to park his car in the street while at his place of business, as day storage is at a premium and access to public garages is difficult. He will convert the property just purchased into a private garage and will be free from the annoying attentions of the vigilant traffic squad in the future.

GILL SALES STAFF AUGMENTED.

The sales staff of the Gill Manufacturing Co., Chicago, has recently been augmented by the addition of F. F. Fulton, formerly sales manager for the Inland Machine Works, St. Louis. Mr. Fulton will devote his time with the Gill organization to working as a special representative doing constructive sales work in conjunction with the various distributors of the well known Gill piston rings.

OVERLANDS MADE GOOD RECORD.

In the recent army transport tour from Washington to San Francisco, three of the new Overland Fours, acting as scout cars, covered 5055, 4743 and 4387 miles respectively, and no repairs with the exception of tire changes were necessary. One car made two changes, another three and the third six.

ACCESSORIES, EQUIPMENT AND TOOLS FOR THE GARAGE AND REPAIR SHOP

Rie Nie Liquid Radiator Cement stops the leaks and forms a seal to withstand the jar of rough roads. When left in the radiator it automatically seals any new leaks which may develop, the manufacturer states.

Rie Nie liquid cement, it is claimed, will prolong the life of the radiator by keeping it free from rust and scale accumulations, and works effectively in alcohol or any other form of anti-freezing

solution. Used by steam fitters and plumbers in repairing hot water plants and steam boilers; also by automobile repairers for repairing cracked water jackets in engine cylinders.

Manufactured by the Durkee-Atwood Co., Minneapolis, Cleveland and Detroit. Prices on application.

"Cincinnati" Portable Electrical Grinders are particularly adapted for use in automobile and truck service stations and garages. These grinders are wound for direct and alternating current of any voltage, and the speeds are adapted for the particular current and the size wheel carried.

All motor windings are of the highest grade material and fully enclosed and protected. Dust hoods are fitted on the spindle to protect the bearings and windings from emery, dust and dirt. All spindles are ground.

The bearings of tool post grinders are of special bronze cone shaped and adjustable to wear by means of an adjusting screw in the motor caps. The end play is taken up by adjusting the round nut on rear end of spindle. No part of the motor housing is used as a bearing. Bench and floor grinders are fitted with annular ball bearings on both ends of the armature spindle.

The motor cap at one end of the grinder is fitted with an adjustable container, which holds the outer race of the ball bearing and both are locked in the motor cap by means of a threaded nut. The inner race of the ball bearings is locked to the armature shaft by means of a special designed dust cap doing away with all friction. Grease cups are provided on each end of the motor for bearing lubrication.

All motors are air cooled by means of a

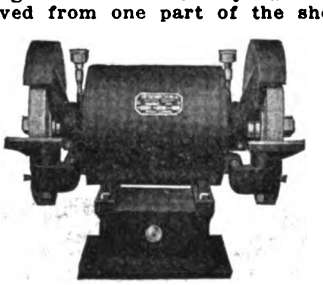
fan on the armature shaft, which forces a continuous circulation of air through the holes in the end caps. The brush holders are enclosed and fully protected. They are easily accessible and brushes can be readily renewed when necessary.

The bench and floor grinders are suitable for grinding of all kinds; also for buffing and polishing. They are equipped with two detachable tool rests and wheel guards; also with patented starting switch which is of the quick make and break type, and is entirely enclosed in the base of the motor.

Tool post grinders are made with horizontal free hand feed, also without feed. They are especially adapted for grinding lathe centers, cutters, reamers, dies, tools, etc., and for surface, parallel and internal grinding jobs of all kinds. They can be clamped in a vise for ordinary bench work.

All grinders are sent out complete ready for work and with all attachments included.

"Cincinnati" electrical grinders have a great advantage over the ordinary belt driven grinders in that they can readily be moved from one part of the shop to



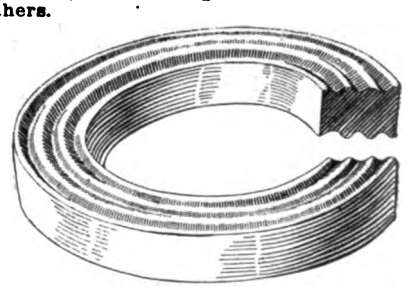
another. Grinders are made for all classes of work in sizes ranging from ¼ horsepower to three horsepower. Direct current and alternating current.

Manufactured by the Cincinnati Electrical Tool Co., 1501-3-5 Freeman Avenue, Cincinnati, O. Prices and literature on application.

The Red Devil Corrugated Lock Washer is designed for automotive work requiring a locked fastening that is absolutely secure. The washers have contact on six points, three on the washer and three on the nut and are easily loosened when it is desirable to remove them.

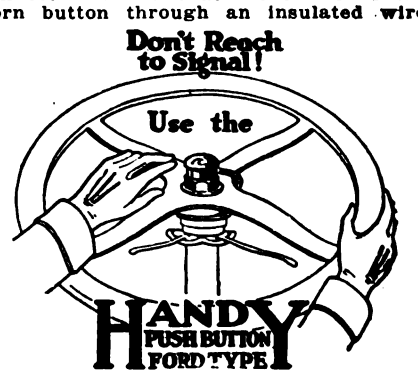
The washers are made of special manganese oil tempered steel, having a gun metal finish that is weather proof and rust proof.

Corrugated washers are constructed in such a manner that they are guaranteed to hold tight under the most extreme vibration. Washers are packed for shipment in 100, 250, 500 or 1000 in a box; also in smaller assortments packed conveniently in a bag for motorists and others.



Manufactured by the Smith & Hemingway Co., Inc., 130 Colt Street, Irvington, N. J. Price, No. 130 assortment, 15 cents; No. 140 assortment, 20 cents; No. 190 assortment, 25 cents.

Handy Push Button for Ford Cars is a horn push button that fits the top of the steering post of the Ford car, taking the place of the hexagon nut usually placed there to keep the wheel tight on the steering post. The base of the button is hexagonally shaped so that it may be screwed down tight, holding the wheel in place. A set screw is provided at one side that makes the fastening permanent. The wire connection is made at the center of the horn button through an insulated wire



leading from the button to the horn, while the button is grounded through the nut fastening the button to the steering post.

It is claimed that this button is a decided improvement over another button that this concern has been manufacturing in the past, which proved very popular with the trade. It is not necessary to remove the hand from the wheel while operating the horn button, as the button is within easy reach of the wheel rim.

The button is made from the best of material and is easily attached in a few moment's time without the use of tools.

Manufactured by the Handy Products Co., Cleveland, O. Price, 60 cents complete ready to attach.

Digitized by Google

A-1 Storage Battery Charging Clip consists of a special patented one-piece, acid-resisting bronze clip that is attached to battery terminals when charging storage batteries in service stations.

The clip is claimed to be made from the highest grade of acid-resisting bronze, lead coated, adding additional protection from the acid of the battery. Its one-piece construction is stated to eliminate the danger of springs slipping out of place and short-circuiting the battery or opening the charging circuit. The pointed teeth of the clip insure positive contact

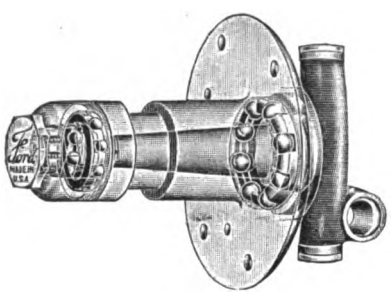
with the terminal of the battery. Jaws open 1½ inches, allowing plenty of space to fit all terminal bolts.

Positive screw connection is provided on one of the legs of the clip for connection to the charging source, while the long screw of the wire connection acts as a stop, limiting the amount of pressure applied to the hinge of the clip, insuring lasting tension. The clip has a rated capacity of 50 amperes.

Manufactured by Charles F. Hartung, Higgins building, Los Angeles, Cal. Prices, less than 10, each 25 cents; lots of 10 to 100, each 23 cents; lots of 100 or more, each, 21 cents.

Goodrich National Ball Bearings for the Ford and Chevrolet 490 Cars consist of the proper number of balls, properly spaced in a holder that may be slipped on to the bearing cone of the Ford or Chevrolet front axle, taking the place of regular loose balls. The material from which the cage holding the balls and the balls are made is of the highest grade obtainable and while low in cost they give results both in steering and driving that make them a necessity.

The manufacturer states that Goodrich National Ball Bearings will reduce the friction of the front axle fully 33 per cent., as the balls being separated do not have a tendency to ride one another, and

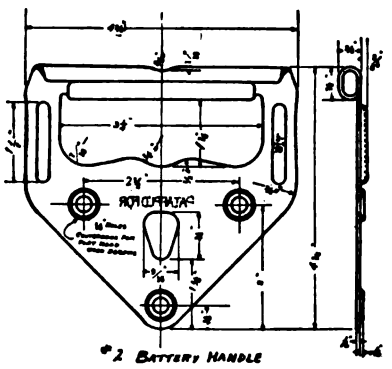


that they are free from crushing strains. The results obtained mean a big saving in repair bills, as it claims that the bearings do not wear out as quickly, balls do not break as readily and wobbly, hard steering front wheels are remedied.

Manufactured by the Goodrich-Lenhart Manufacturing Co., Hamburg, Pa. Price, $1.50 for complete set of four, including balls ready to install.

Mueller Battery Handles No. 2 are a new product that has recently been placed on the market for battery service station trade. These handles are lead coated, have a cut-out section in the center and a place for an identification tag at the top of the grip.

The handles are made of steel by a special process, giving them long life. There is ample room for the repairer's knuckles when handling a battery equipped with them. Screw holes are upset at the edges, giving them added strength, and any acid that is accidentally spilled has a chance to flow away from the screw holes so that they are not injured by acid. The grip is



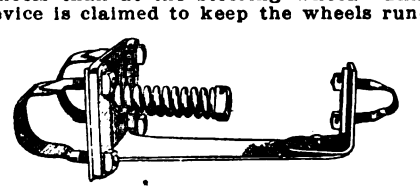
No. 2 Battery Handle

of a heavy mounting, making a very serviceable handle for replacement purposes.

Manufactured by the Mueller Electric Co., 423 High Avenue, Cleveland, O. Prices on request.

The Simplicity Adjustable Steering Device for Ford Cars consists of a double clamp that attaches to the center of the front axle and a second clamp that attaches to the steering tie rod, also a bracket joining the clamps having a spring tension attached to it that offers the necessary resistance to the side pull of the wheels exerted upon the tie rod.

The purpose of the device is to relieve the driver, in steering, of the wobbling effect of the Ford steering system, which effect is felt to a greater extent at the wheels than at the steering wheel. This device is claimed to keep the wheels run-



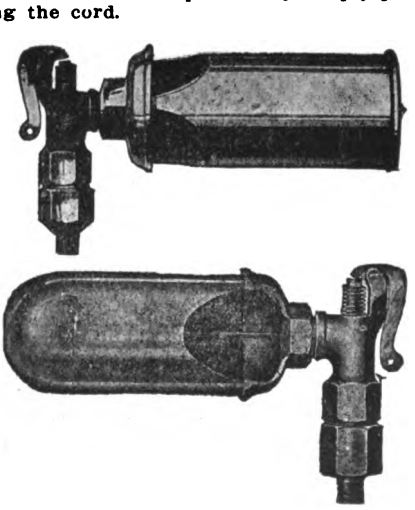
ning in a straight line when driving ahead and when swinging corners or turning to allow the steering wheel to be turned with the same freedom as when the device is not attached.

The device is easily attached in less than one hour and is guaranteed to prevent the chafing of the tires and the grinding out of the bearings, due to uneven running of the front wheels.

Manufactured by the Simplicity Wheel Co., Grand Rapids, Mich. Price, $3.

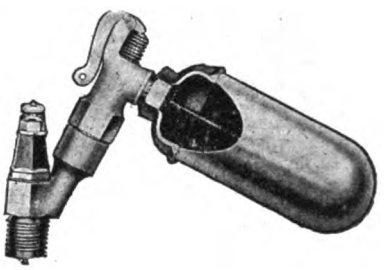
The Buell Explosion Whistle is as its name implies an explosion whistle that operates from the explosion of the gas in the combustion chambers of an automobile or truck engine when the engine is in operation.

The whistle is screwed into a petcock opening, is connected by a cord with the steering wheel of the vehicle and is blown at the will of the operator by simply pulling the cord.



The whistles are made from the best of material in three styles, as well as a type for cars not equipped with pet cocks, where the whistle is placed in the spark plug opening, a special spark plug attachment being required, as follows:

Ford, ½ inch plug; Maxwell and Briscoe, ⅞ inch plug; Buick, Oakland and Chevrolet, ⅞ inch extension plug. Standard Splitdorf spark plugs are used in connection with Buell whistles. As the temperature of the gas passing through the whistle is nearly 3000 degrees Fahrenheit, only the best of materials and design will with-



stand it. Consequently malleable iron and steel are found necessary in constructing the Buell whistles, giving proper radiation to the parts subjected to this terrific heat. No attempt has been made to see how cheap the whistles can be made, but how well, with the result that the manufacturer is able to give the purchaser a positive 10-year guarantee service.

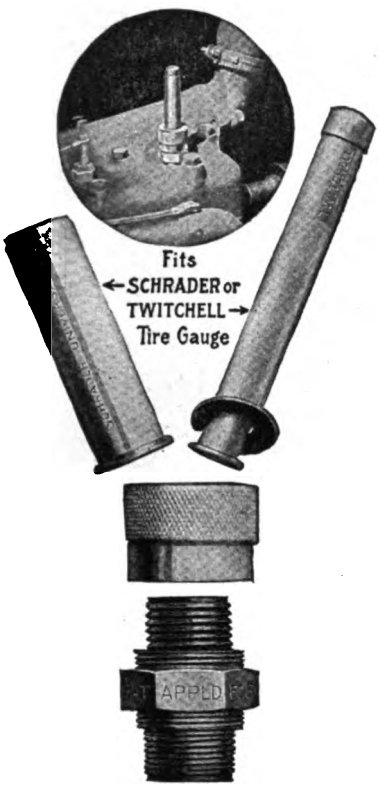
Manufactured by the Buell Manufacturing Co., Cottage Grove Avenue, at 30th Street, Chicago, Ill. Prices, chime, $6; single tone, $4.25; single tone with Ford plug, $5.50.

Practicool Drinking Fountain No. 2 has a capacity of 72 pounds of ice, which will last about three days under normal conditions. Besides being equipped with a Glauber bubbler, it is also equipped with the cooler-ator, which is a galvanized, cast iron water chamber, holding three times as much water as a 40-foot coil of ⅝-inch lead pipe, and will, therefore, effect a 20 per cent. reduction. It is sufficient to reduce 40 gallons of 70-degree water at 50

degrees. The fountain is durably constructed, being made of heavy iron with a galvanized iron ice chamber. Granulated cork is used for insulation. Connected with waste and supply pipes it requires no attention, the manufacturer claims.

Manufactured by the Glauber Brass Manufacturing Co., Cleveland, O. Price, $75. Three other types are also manufactured.

Digitized by Google



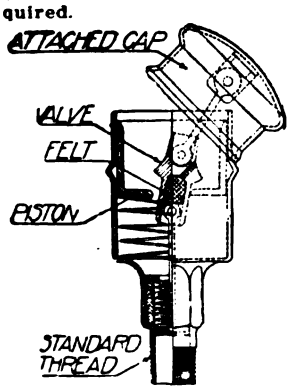
The Duplex Compression Tester is for detecting weak cylinders, and is made to fit spark plug openings of either ⅛ inch or ⅞ inch. It is used with either a Schrader or Twitchell tire gauge fitting and a special nipple, and has a knurled nut fitting the top of the nipple that holds the tire gauge in place. To use the tester, remove the spark plugs and insert the nipple into the opening. The tire gauge is set on the top end of the nipple and the knurled nut passed down over it. A washer or gasket is inserted between the nut and the flanged edge of the tire gauge, and when tightened with the nut forms an air tight joint.

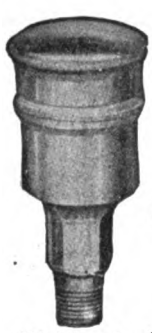
With the tester in place the engine is turned by hand and the tire gauge will show the compression of the cylinder in pounds. Testing the other cylinders in like manner will show the cylinders that are weak.

The manufacturer claims that the tester will determine if the valves need grinding, if the piston rings are fitting tightly, or if the gaskets leak compression; in other words, will be able to detect troubles that otherwise would not be found unless the engine was torn down.

Manufactured by the Casey Hudson Co., 357-61 E. Ohio Street, Chicago. Price, $1.

The Felix Oil Cup, the maker states, embodies a new principle in oil cup construction, as heretofore cups have been used solely for the use of grease and have been used on the compression principle, whereby the Felix oil cup is made to use oil only and to supply this oil in the quantities needed to the bearings when required.





The cup in shape resembles the regular compression cup, differing from it only in the interior construction. The interior is fitted with a movable piston, fitting the sides loosely and moved by spring action. A coiled spring, resting on the bottom of the cup, causes the piston to rise and fall as necessary. The cover of the cup is fitted with a hinged joint at its inside center and to this is hinged a short arm, connected by a second hinged joint to a valve.

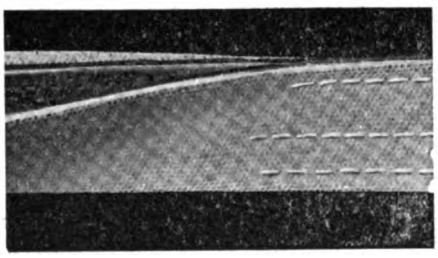
The lower end of the valve is connected to a spring in the lower section of the cup by a rod having a washer integral with it and fitting beneath the spring. After filling the cup with oil, to operate, lift the cover; by so doing the valve is lifted, allowing a portion of the oil to pass through the center of the piston and flow down into the bearing. This is to allow the oil to flush the bearing. At ordinary times the valve is self-operating and will supply the oil in moderate quantities as needed.

It is claimed that this device is an improvement over the usual compression grease cups and that oil, being a bettor lubricant, will lubricate the bearing. to better advantage.

Manufactured by the Felix Mfg. Co., 4437 N. Clark Street, Chicago. Prices on application.

Blue Ribbon Cork Filled Transmission Band Linings differ from the regular transmission band linings for Ford cars in that they are lined with cork and the cotton fabric is specially treated with a compound that makes the band wear to a point where it cannot be further adjusted, the maker states.

It is a built-up lining consisting of fabric with a strip of cork inserted between the layers of fabric. The strip of cork, on account of impervious qualities resisting oil and moisture, does not lose its elasticity and therefore provides a permanent and literally pneumatic cushion to Blue Ribbon linings, making a soft and



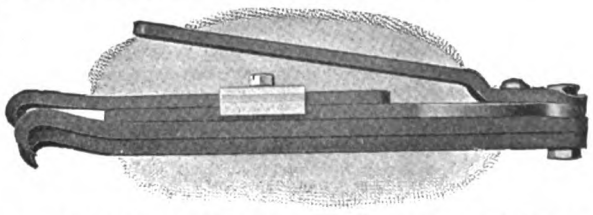
progressive engagement possible, it is claimed.

To further increase the resistance toward grabbing, the fabric is treated with a compound under heat and pressure which not only imparts softness to it, but also reduces its tendency to glaze.

Manufactured by the Right Motor Specialties Co., 1326 Michigan Avenue, Chicago. Price, per set of three with solid brass rivets, $2.50 in the states, $3 in Canada.

The Lawco Rim Tool is used for the removal of shoes from demountable rims and is composed of four levers, fastened at a common center. Three of the levers are formed with a hook end for fitting over the rim edge, one of them being adjustable for different size rims.

It is claimed that this tool is adapted to practically all of the demountable type rims on the market. If an owner has a rim that this tool will not readily open, the manufactured will gladly send directions for setting the tool for this particular rim. When folded the Lawco rim tool may be packed in the tool box.



Manuf..ctured by the F. H. Lawson Co., Cincinnati, O. Price on application.

Atsco Portable Service Tank is an emergency tank to be used by the garage and service station for inflating tires of passenger cars and light trucks that have new tires fitted at a distance from the service station or garage.

It consists of a tank 36 inches in length and 10 inches in diameter, constructed of heavy sheet copper with all joints brazed. It is equipped with a carrying handle, shut off valve, length of heavy air hose and an automatic air valve for connecting to the valve of the tube to be inflated; also provided with a valve at the side for refilling with air from the shop source of air supply.

The outfit is shipped from the factory ready for use and filling with air is all that is necessary to prepare it for use. The working pressure is 250 pounds and the tank is tested to 500 pounds pressure at the factory. The tank is of a convenient size and is easily handled by one man. It is placed in the rear of the emergency car ready for use.

When operating the tank, simply open the valve on the tank, connect the automatic valve to the tire by pressing down and the tube is inflated quickly. Other tanks manufactured by this company are genuine copper-brazed, electric or acetylene welded or riveted. All sizes of tanks are made and for many purposes, such as for air pressure storage, underground storage of liquids, etc.

Manufactured by the Air-Tight Steel Tank Co., Pittsburgh, Pa. Price of the emergency air tank complete, $24.50 f. o. b. Pittsburgh.

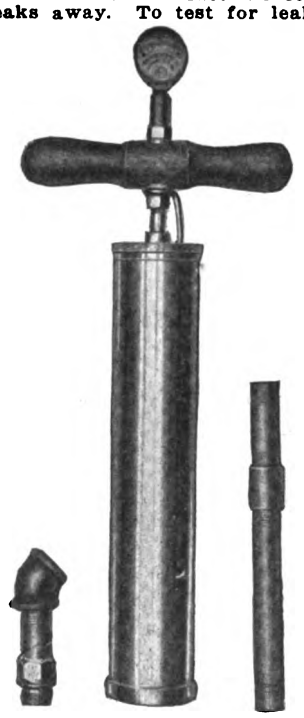
The "Whistler Thumb Lock" comprises the "Thumb Lock" air hose connection and the "Whistler" automatic safety tire pressure regulator. It is applied to the valve by pressing down the small lever in the head of the chuck with the thumb. The small calibrated collar is set with the fingers to the pressure desired. The engine is started and when the pressure in the tire for which the calibrated collar is set is reached air will exhaust, giving forth a whistling sound. No more air can be put into the tire.

Manufactured by the Automatic Safety Tire Valve Corporation, 1765 Broadway, New York. Price, $2.

Hempy-Cooper Motor Tester is a device for testing the compression of a gasoline engine and also shows by its pump where and what leaks occur in the engine cylinders causing the engine to loose power.

The tester is screwed into the spark plug opening of a cylinder, the piston is brought to its top position on the compression stroke and by means of the indicator at the top of the pump handle, there is shown the compression of the combustion chamber and also how fast the compression leaks away. To test for leaks, the



pump handle is forced down, causing air to be forced into the cylinder. A hissing sound indicates that a leak is present and may be found either in the valves or around the piston rings.

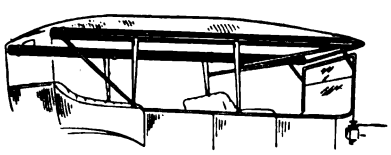
The tester is of particular value to service stations and garages, as by its use considerable time is saved in determining troubles due to loss of compression and locating these troubles. The tester consists of a cylinder with suitable connections and fittings for connecting to any spark plug opening. It is fitted with a plunger similar to that used in a tire inflation pump, but the rod differs from the ordinary air pump by having the rod constructed of a hollow tube, which passes up through the handle to the indicator.

It is claimed that other faults can be found by the Hempy-Cooper tester, such as loose bearings, loose piston rings, piston slap, and for each there is a positive indication. Testing and adjusting may be done as the work progresses.

Distributed by the Fairbanks Co. Administrative offices, New York; sales offices in many of the principal cities. Prices and literature on request.

The No-Fault Pocket for Ford Side Curtains are made of double texture leatheroid, lock stitched. The No-Fault pockets extend the full length of the top on each side and easily hold the three curtains that are used on each side of the Ford car.

The pocket is divided so that the rear curtain may be dropped independent of either of the others and is loosened by the passenger or the operator on the seat by simply unbuttoning four small clasps on

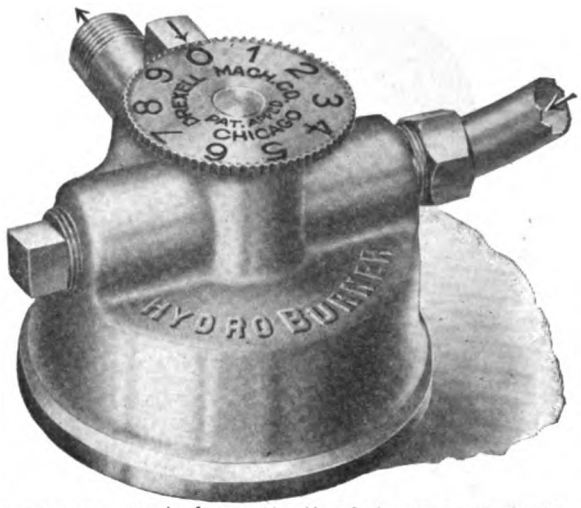


each pocket and dropping the curtain. The curtains are always fastened at the top so that all that is necessary is to fasten them at the bottom, or if the operator wishes all curtains may be dropped. It is easily installed by anyone handy with a hammer in a few moments.

Manufactured by the No-Fault Specialty Co., Box 17, Stoneham, Mass. Price, for touring cars, $4.50; for roadsters, $3.50.

The Hydroburner is a new instrument which takes the air and hydrogen vapors from the top of the radiator and draws them into the manifold above the carburetor in measured quantities according to the demands of the engine. The case contains an automatic valve and a diaphragm acting as dash pot in a water chamber and is so disposed that the valve, which is normally closed, is timed automatically and does not open until 15 seconds after the engine is started. This, the maker states, eliminates the trouble experienced in starting engines when devices of this kind are used. The water chamber is kept constantly charged by condensed vapor from the radiator.

In the top of the dial is a wheel which is numbered one to nine and can be set by the driver at some number where the engine is found to perform the best results. This feature, the maker states, limits the opening of the valve, prevents too much hydrogen and air being admitted to the cylinders and does away with dash



control, no attention being necessary after it is once set.

The instrument is attached to the manifold with one-eighth inch standard pipe thread and can be connected in the same opening where the vacuum tank enters by using a ⅛ inch tee.

A 5/16 inch copper tube is attached to the instrument and extends through the radiator to the under side of the filling cap. A check valve is placed over the end, opening inwardly, against a light spring. This valve is designed to prevent water from getting into the pipe when the radiator is being filled. A special rubber gasket is furnished for making the joint where the tube passes through into the radiator and no soldering operation is required in attaching. The case is made of aluminum and weighs four ounces. The device has a capacity for all sizes of motors used in automobiles, trucks and tractors.

Manufactured by the Drexell Machine Co., 115 E. S. Water Street, Chicago. Price, $5.50.

Easyon Tire Chains consist of a set of eight single chains, four for each wheel, that are attached to the spokes of the

wheel by special leather covered fasteners fitting over the tire and rim.

Easyon chains are cross chains of a patented design and the manufacturer claims they will not injure the paint and varnish

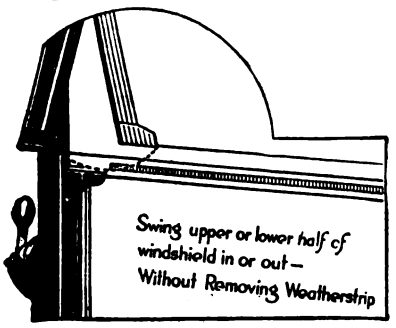
of the spoke or rim or the rubber of the tread. It is further claimed that Easyon chains will not bump while passing over pavings and that they exert a very strong pull in mud and snow.

Manufactured by Woodworth Manufacturing Corporation, Niagara Falls, N. Y. Prices, 3 and 3½ inches, $4 per set; 4 and 4½ inches, $5 per set; 5 and 5½ inches, $6 a set.

Digitized by Google

Tri-Co-2-Way Windshield Weatherstrip allows opening the windshield two ways, either in or out. The weatherstrip is constructed of rolled metal, specially made, nickel plated and polished, fitted with a flexible rubber, forming an air tight and water tight seal across the channel of the windshield.

The use of this weatherstrip makes possible the opening of the lower glass inward for ventilating purposes without removing the weatherstrip. The weatherstrip is made in such shape that it clings to the glass regardless of the thickness



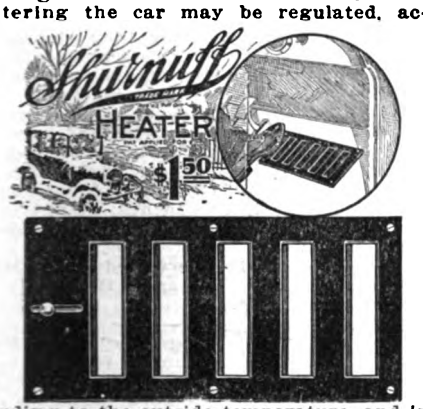
of the glass, the manufacturer claims.

Made in three sizes, known as 36½, 38½ and 40½ inches, but may be cut to fit any glass. It is attached to a Ford windshield by fitting the lower glass, rubber on the outside, allowing the rubber to fold downwardly between the upper and lower glass, forming a perfect seal.

Manufactured by the Tri-Continental Corporation, Buffalo, N. Y. Prices on application.

The Shurnuff Heater for all cars may be installed on the front foot board or in the tonneau. Heat from the exhaust pipe and engine is used when installed in the front of the car and heat from the muffler when installed in the rear compartment.

The heater is provided with a damper arrangement so that the amount of heat entering the car may be regulated, according to the outside temperature, and in summer may be entirely shut off.

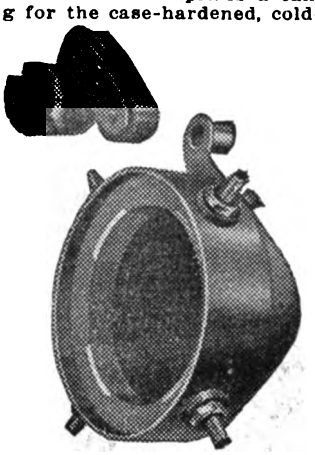


The Shurnuff heater is 9¾ inches long and 5½ inches wide and is neatly finished in nickel. The heater is easily installed by sawing an opening in the floor boards and fastening the heater by six screws. Each heater is packed in a box with screws and installing directions.

Manufactured by the Shurnuff Manufacturing Co., 3147 Locust Street, St. Louis, Mo. Price, $1.50.

The Tri-Co Timer for Ford Cars is constructed entirely of cold rolled pressed steel, making a timer that is practically indestructible. The fiber ring is of the best known hard Egyptian fiber, inserted in the case under pressure and dressed to a smooth surface. All contact points are insulated through the shell and are fitted with hard fiber washers and hexagon nuts. Terminal points are fitted with standard 10/32-inch machine screw thread to which the regular Ford terminals may be quickly adjusted.

An improved dust proof automatic spring top oiler insures a means of thoroughly lubricating the working parts, at the same time preventing the entrance of dust and dirt into the timer case. The brush construction comprises a cantilever housing for the case-hardened, cold-rolled



steel roller. Spring tension is maintained by a compression spring of fine steel wire firmly held in a recess of 1/8 inch, eliminating the possibility of breakage or injury through vibration. The spring tension brings an even pressure to bear at all times on the roller, insuring steady contact. The Tri-Co Timer is fully guaranteed by the manufacturer.

Manufactured by the Tri-Continental Corporation, Buffalo, N. Y. Prices on application.

Tilton Endless Woven Fan Belts are made of fabric by a patented process that finishes the edge in such a manner that it will not fray in use. Tilton belts have proved after a season of use that they will not stretch, this feature having been cared for in the making.

Comparing a Tilton belt that has been in use for a time with a new belt, proves that the length of the used belt is the same as the new belt, the manufacturer claims.

ENDLESS TILTON WOVEN FAN BELTS

Tilton belts are made by a special process by which the manufacturer is able to make an endless belt that meets all requirements of a high-grade fan belt and is free from thick spots that would cause it to jump when passing over pulleys. These belts are fabricated on a machine which makes the belt in one continuous piece.

The Tilton endless woven belt retains its pliable and resilient features even

though the stretching features of the fabric have been removed.

Tilton belts are claimed to be oil, heat and stretch proof and of the highest quality obtainable.

Sold by Edward A. Cassidy Co., Inc., 280 Madison Avenue, New York. Prices from 50 cents to 60 cents each according to the car. Sizes for all cars on application.

"Gredag" Lubricant for Transmissions and Differentials and general cup use is made from a formula developed by Dr. E. G. Acheson. Gredag is a blending of the highest quality grease with exactly the right proportion of 99.9 per cent. pure gritless graphite. This combination produces a very fine lubricant.

Gredag is made from the best fats and oils obtainable. Long cooking and continuous stirring in steam jacketed kettles assure complete saponification and an absence of free fats. This is given as the reason why Gredag will not break down

under long continuous use and why it will not gum or corrode bearings.

During the cooking process a special graphite is added, after being mixed with oil to insure permanent diffusion. This special graphite is made in electrical furnaces at 7500 degrees Fahrenheit, which volatilize all other elements, leaving only the pure, unctuous, smooth graphite. When Gredag is used the tiny particles of

GREDAG
A WONDERFUL LUBRICANT

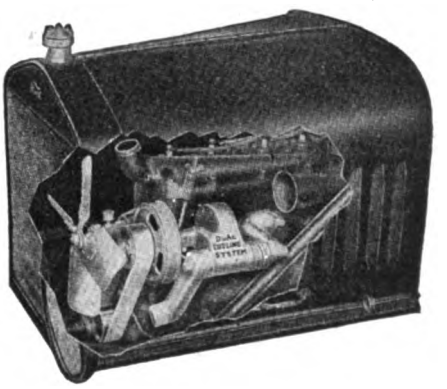
graphite are carried by the grease to the bearings and find lodgment in the minute inequalities of the surface of the metal, producing the nearest to a frictionless bearing obtainable in mechanics, it is claimed.

Manufactured by the Acheson Graphite Co., Lubricant Department, Niagara Falls, N. Y. Prices on application.

The DuAl Cooling System for Ford Cars, Tractors, Trucks and Power Attachments consists of a special pulley leather covered, for the crank shaft, circulating pump equipped with two pulleys, and a special high-speed fan. The driving belts are 1½ inches wide, constructed of cord material similar to that used in the construction of cord tires.

The circulating pump is attached to the side of the engine, by regular Ford bolts, and is easily applied in about 30 minutes time without the use of special tools.

The DuAl centrifugal circulating pump, special fan and drive, has several patented features. The pump body, swinging on



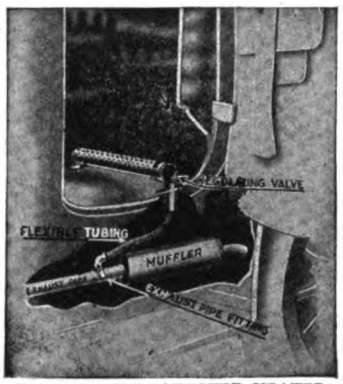
the water line, permits positive belt adjustments. Adjustment for the fan is provided by a winged nut and spring attachment at the fan.

The belts are easily removed in case of repairs to the engine and the pump may be swung out of the repairer's way, while work is being done on the engine.

Manufactured by the DuAl Manufacturing Co., 1424 Nicollet Avenue, Minneapolis, Minn. Price, $25, including all necessary fittings and instructions. Ten days' trial, money refund proposition. Agents and dealers wanted.

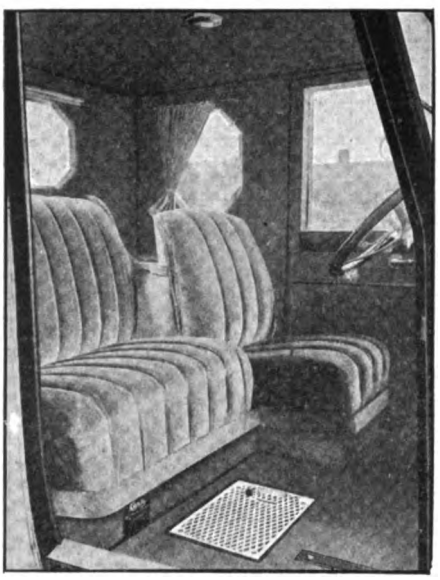
Digitized by Google

The Utility Protected Foot Rail Heater for the passenger car is operated by the



How UTILITY PROTECTED HEATER Is Attached to the Exhaust

heat from the exhaust. The heater is attached to the floor of the car, either in the front or rear compartment, by boring two small holes in the floor for the heating pipes to pass through. Screws in the brackets fasten the heater to the floor. The heater is connected by a short length of flexible tubing to the exhaust pipe ahead of the muffler, and the heater is controlled by a small damper that allows the admission of more or less heat as desired. The heater is covered with a perforated nickel plated protector.



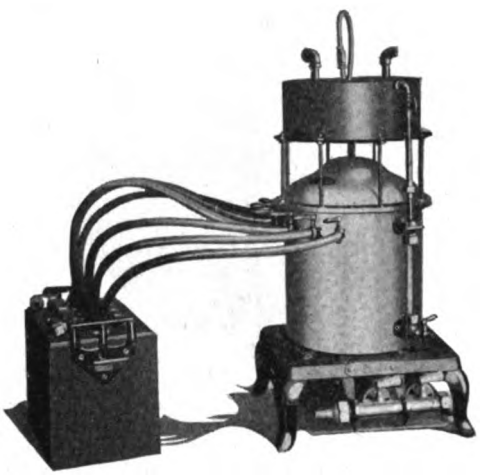
The manufacturer states that the heater will not burn the feet resting upon the protector, that the heat may be turned off or on without burning the fingers, and that the operation of the heater does not affect the running of the engine. The heater is made in four models: For all cars, for front seat, for Fords and other small cars and for eight-cylinder cars.

Manufactured by the Hill Pump Valve Co., Archer Ave., Canal and 23rd Streets, Chicago. Prices range from $9 for the Ford size to $25 for eight-cylinder cars. When ordering state outside diameter of the exhaust pipe ahead of the muffler, or make, year and model of car.

The "Ibsco" No. 3 Combination Battery Steamer and Still is a useful device for the battery service station and battery repair department of the garage. The boiler is of 14-gauge spun aluminum. There are no seams to leak and the boiler might get red hot without danger of leaks or injury it is claimed.

A water gauge shows the height of the water in the boiler. Six brass cocks, to which the hose is attached, provide a means of using the steam generated for steaming open storage batteries. The cocks are so made that the hose is attached without the use of fasteners. The steamer will open one 12-volt battery or two six-volt batteries at a time in five minutes.

The still is located above the boiler, has an outlet through a length of pipe and a valve and may be connected by copper tubing having a coil immersed in a pan of



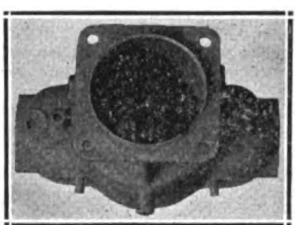
water or other container. The capacity of the still of one gallon of distilled water per hour is at a cost of about one cent per gallon, the maker states.

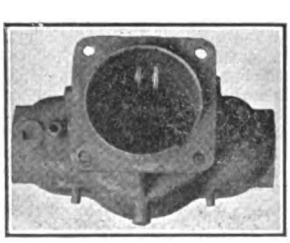
The steamer and still are operated by a gas burner, inserted in the base, which, it is said, is quick in steaming. The steamer is easily accessible for cleaning by unscrewing the bolts that fasten the boiler dome to the boiler, unscrewing the union above the water gauge and lifting off the top, or, if same is held by the water pipes, slide the boiler right off the burner, clean and reassemble.

Manufactured by the Illinois Battery Steamer Co., Peoria, Ill. Prices, No. 1, $50; No. 2, $32.50; No. 3, $50; No. 1 combination, $65.

The New Process for Repairing Scored Cylinders, known as the "Wizard Process," is a method whereby chemicals are employed in the repairing of scored cylinders, air and sand holes, cuts, etc., of automobile engine cylinders.

The Wizard process fills the scores or cavities in the cylinders caused by loose wrist pins with an alloy, carefully compounded and smoothed down to the face of the cylinder, the same piston and rings being used after the repair is made. The





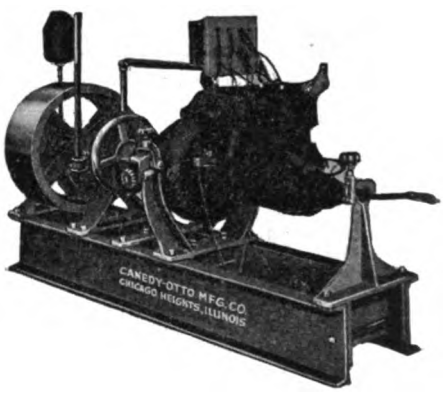
alloy used has unusual heat resisting qualities, and while it is applied in a hard state it forces its way into the pores of the iron, and, it is stated, never works out.

This process does away with the necessity of regrinding, reboring or warping. In the "Wizard Process" heat is not used, so that warping of the walls of the cylinders is impossible. The company states that it has repaired cylinders by this process that have been in constant use for years and guarantees the process to the trade.

Manufactured by the Wizard Scored Cylinder Repair Co., 53 Peoples Bank Building, Wilkes-Barre, Pa. Prices and literature on request.

The Canedy-Otto Burning-in and Testing Machine for Ford Engines is for the service station and garage repair shop making a specialty of Ford engine repair work. It has all the necessary equipment, such as coil support, gasoline tank and water connections, so that after the burning-in process has been completed on the bearings the engine may be tested on the stand to further limber up the bearings and prove that it is running properly.

As a burning-in machine for engine bearings, the machine requires from 6 to 10 horsepower, and it occupies little space. The features that the manufacturer emphasizes are that the machines represent ac-

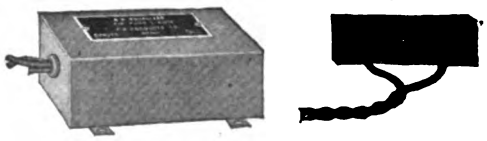


curacy, durability and good workmanship, and that they are built to perform every required operation with good results, at a saving of from four to five hours on bearings alone.

In burning-in bearings they should be burned the way that the crankshaft rotates in the assembled engine and this is possible in the Canedy-Otto machine. The net weight of the machine is 775 pounds; total height, 32 inches; width of base, 18 inches; diameter of flywheel, 23 inches; length over all, 76 inches; total width, 28 inches; weight of flywheel, 350 pounds; face of flywheel, nine inches; height from bottom of base to center of main shaft, 20¾ inches.

Manufactured by the Canedy-Otto Manufacturing Co., Chicago Heights, Ill. Prices on application.

"4 A Straight Equalizer" for Ford Lights, without the dimming feature, comprises a small box-like device that takes the current from the Ford magneto and transforms it in the electro-magnetic principle so that the light will burn with the same brilliancy regardless of the speed of the car. For a slight additional cost a dimming device may be attached that works in conjunction with the equalizer,



giving a dimming effect to the head lights when passing other cars. The light is of a powerful intensity at low engine speeds.

A storage battery is not necessary, as the device works solely on the main current supply from the magneto. It does not interfere with the ignition and enables the operator to sound the horn without dimming the light when all lights are burning. The regular Ford lamps (9-volt, 2 candlepower) are used.

Manufactured by the 4 A Products Co., Denver, Col. Price of the equalizer, $5; equalizer and dimmer, $6.

Digitized by Google

The B & L Electric Gas Primer for Gasoline Engines is a device to facilitate starting during cold weather and to do away with the troubles encountered when trying to start the engine on cold gasoline. Advantage is taken of the fact, in constructing B & L electric primer that gasoline brought to a working temperature by heat supplied by an electric current will start the engine much more readily than will gasoline that has not been heated.

The B & L electric primer consists of a dash pull button and switch located on the dash within easy reach of the operator and connected to a plunger pump located on the top of the primer and connected to the gasoline feed line, the switch being connected by an insulated copper wire to an insulater terminal on the primer and by an insulated wire to the positive terminal of the storage battery.

The primer consists of a cylinder, with a coil suitable for heating, installed inside and connected to the terminal and one side, and a ground connection at the other. The coil is composed of suitable resistance wire to heat in from five to 15 seconds after the switch is closed.

The primer is attached to the intake manifold by a nipple and is provided with

a small tube that has a small opening to allow the warm gasoline to flow into the manifold in a small jet or stream.

To operate, the switch is closed, allowing the coil to heat; the primer pull button is pulled forward quickly and allowed to drop back into the dash. In this manner a supply of gasoline and air from the fuel line is forced into the primer tank, is warmed by the coil and flows from the tank into the intake manifold. The engine is turned by the starting motor while the priming operation is taking place, so that the gas may be the more readily drawn into the combustion chamber.

The manufacturer claims that this device may be attached to practically all systems using a storage battery for starting, lighting and ignition, or starting and lighting alone. For Ford cars a special primer is manufactured. This device is applicable to cars of either gravity, vacuum or force feed, by locating the primer in the positions recommended by the manufacturer. The voltage of the coil must correspond to that of the battery used on the car, and, in ordering, the buyer should specify voltage used and whether wiring is grounded or two wire system.

Manufactured by the Auto Distributing Co., Plainfield, N. J. Price, $15. Fifteen days trial allowed under the guarantee. If not satisfactory money will be refunded.

Guarantee Visible Gasoline Pump for filling stations and garages, consists of a curb stand equipped with suitable pumping device and a five-gallon glass bottle mounted at the top, protected by wire screening. Above this glass bottle is a globe with an electric light that may be lighted at night, showing plainly the lettering on the globe, "Filtered Gasoline."

The pump is operated by a small electric motor in the base. The gasoline is drawn from a tank buried in the ground and forced to the elevated bottle in the quantities desired and in plain sight of

the purchaser. From the bottle the gasoline flows by gravity to the tank of the car.

The manufacturer claims that with a visible tank the trade is more satisfied and that sales of gasoline greatly increase. It is claimed that the Guarantee Visible Pump will handle all grades of gasoline through the same pump without any changes in the pump being necessary; that it is not affected by temperature and that no gasoline is held above ground only as used. Inspected and approved by the National Board of Fire Underwriters.

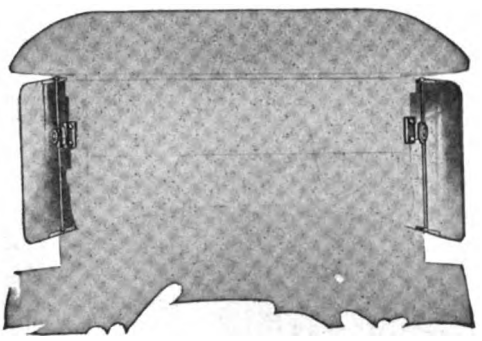
Manufactured by the Guarantee Liquid Measure Co., Pittsburgh, Pa. Prices and literature on application.

"Stik-Tite-Lily-White" is a pure, white, all elastic tube patch. The manufacturer claims that the material is made of a preparation of cured and uncured stock which cannot be separated by heat or otherwise after once united. It is sold under guarantee.

Manufactured by the Cincinnati Auto Specialty Co., 312-14 Main Street, Cincinnati, O. Prices, 50 cents to $4, according to size. Made in four sizes for the motorist and shop use.

The Perfection Side Windshield is a new device that is attached to the windshield at the sides and its purpose is to deflect the wind pressure of the windshield away from the passengers. The deflector is attached by a single bracket to the side upright of the windshield and is allowed to swing in or out as occasion requires.

The glass of the deflector is extra heavy and is supported by means of a rod, passing through the glass five inches down from the top and at the bottom by a clip over the edge of the glass and fastened to the rod. In this manner the full weight of the glass is carried by the bottom clip and the rod fastened to it. Nickel fittings are used throughout and these are rust proof and match the nickel finish of the



car. All parts of the deflector are guaranteed by the manufacturer against defective workmanship and material.

Manufactured by the Perfection Windshield Co., 409 N. Capitol Avenue, Indianapolis, Ind. Price, finished in black enamel, nickel trimming, $22.50; full nickel finish, $27.50.

The Joly Spark Plug has the shell and porcelain integral, with the electrode passing through the center of the porcelain to the sparking points of the shell. Two sparking points, diametrically opposite each other, are cast in one piece with the shell and are positioned equidistant from the center electrode.

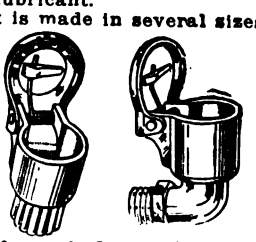
The manufacturer claims that the Joly spark plug cannot develop carbon, leak compression, short circuit, cause pre-ignition or fail to synchronize between explosions. He states that this plug in a different form was used for airplane engine ignition during the war and proved endurance for 70 to 80 hours of continuous service in that class of work.

Manufactured by the Lyons Ignition Co., 215-219 Fourth Avenue, New York; factory, Paterson, N. J. Price, automobile type, $1.50 each; airplane type, $3 each.

The Rex Oil Cup features a self-closing top and a self-lubricating cup that is filled with either felt or cotton. Lubricant is supplied to the felt or cotton filling and flows to the bearing by pressure of a spring.

Rex oil cups may be fitted to any slow moving bearing, and the manufacturer claims that the bearing will be assured of plenty of lubricant.

The Rex is made in several sizes and in



four models, each designed for some particular point of lubrication. For example, model A, which is not threaded, is to be used in drilled holes, and is driven home with one stroke of a hammer. It is also made in different lengths and sizes to meet all requirements. Model B is threaded and is for general use. Model C differs from model B in that the stem is located at right angles. Model D has the stem located at a 45-degree angle and is made any length to suit conditions.

Manufactured by the Autoware Corporation, Detroit. Prices range from 30c up.

"Outerall" the Economy Garment for the motorist, repairer and children consists of a one-piece suit that is slipped on over the regular clothes, keeping them free from oil, dirt and dust.

The Outerall is a particularly neat, comfortable garment, heavily reinforced throughout, and is made especially for several lines of trade. The style for repairers, machinists and motorists, is fitted with extra pockets of ample capacity and may be purchased either open at the neck or with collar, as desired.

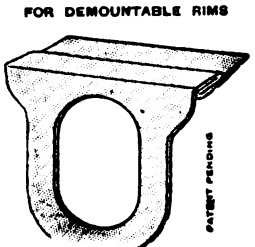
Also made for children of all ages from two to 14 years as play garments. These garments are loose fitting and do not bind the limbs of growing children.

Outeralls are made in both khaki color and overall blue with white stripes for children and in khaki or olive army shade for the mechanic and motorist.

Manufactured by the Michigan Motor Garment Co., Greenville, Mich., with sales agencies in many of the largest cities. Prices on application.

Tri-Co Rim Tightener for demountable rims that have become loose and squeak on the rim contacts. The rim tighteners are shims finished in army zinc so that they will not corrode or rust and are to be fitted underneath the demountable clamp to take up whatever play is between the rim of the wheel and the demountable rim.

TRI-CO
RIM TIGHTENER
FOR DEMOUNTABLE RIMS



It is stated that the rim tighteners will take up all play between the rims and prevent the rims from squeaking.

Manufactured by the Tri-Continental Corporation, Buffalo, N. Y. Price per set of 20, $1.

The Outlook Windshield Cleaner with the rubber roller and a type for every car embodies several tried and proven principles. The windshield cleaner is attached in a few moments by simply attaching to the top frame of the windshield. The roller is placed on the inside and the rubber scraper on the outside. To operate, the operator grasps the rod carrying the roller and simply sweeps the scraper across a space of the windshield. The roller serving the double purpose of keeping the cleaner tight upon the windshield and giving a free movement to the cleaner.

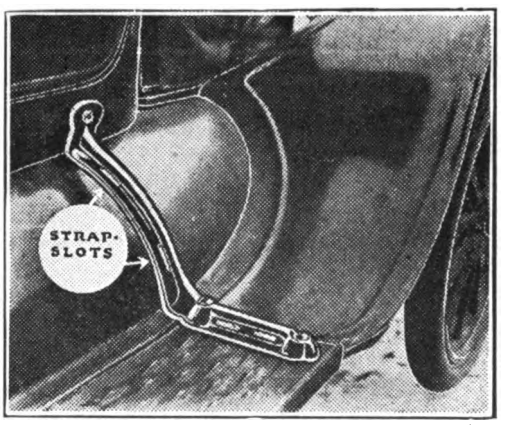
Windshield cleaners are made for cars

having the windshield fitted tight at the top; these are attached either by boring a hole in the glass of the shield or through the frame at the top. Cleaners of this type are also adapted for closed cars.

Manufactured by the Outlook Co., Cleveland, O. Prices and literature on request.

Prince's Bracefords for the Ford Car is a patented device that is attached to the body and the running board of the Ford car, greatly strengthening the running board. Slots are cut in the sheet stamping, from which Bracefords are made, allowing straps to be inserted so that luggage may be carried.

The device is attached to the body by



drilling a hole and inserting a bolt, while the running board end is fastened by two bolts through the running board. The Bracefords fit the apron of the car snugly so that there is small chance for running board or apron noises.

Manufactured by the Prince Manufacturing Co., 109-11 South Salem Avenue, Sumter, S. C. Price per set of four, $4.25.

The Sutter Flap is designed to control the temperature of the cooling medium of an automobile radiator and is made of leatherette material lined with a wool like substance to protect the painted surface of the radiator from being damaged.

The cover is fitted over the top and sides of the radiator, while the flap covers the front and is raised and lowered by a cord fastened at the top of the flap, passing through a tube inserted in the radiator top in one of the air passages, across the top of the engine to a hole bored in the dash, passing through this opening and being controlled by the driver from the seat.

Spring tension is provided in the flap for rolling the curtain and cord when the flap is dropped, keeping the flap in a rolled position when not in use.

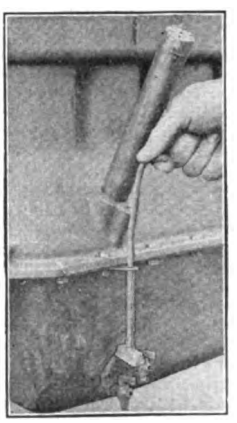
It is stated that the flap may be raised and lowered when the car is in motion as readily as when the car is standing still.

Sizes are as follows: Small, 13 inches wide by 13 inches high; Dodge, 16 inches

wide by 13 inches high; medium, 16 inches wide by 17½ inches high; large, 18 inches wide by 17½ inches high.

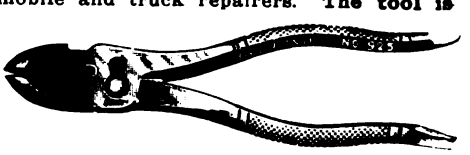
Manufactured by the Sutter-Mayhew Co., 174 Canfield Avenue, Detroit, Mich. Prices on application.

Holton Oil Tester for 490 Chevrolet Cars consists of a short rod having an offset handle, a plate that is attached to the base of the engine and a spring that supplies the necessary tension to keep the rod from becoming noisy. The lower end of the rod has a fitting attached that fits the wing of the wing handle of the oil petcock. To operate the tester the handle is depressed till the fitting at the lower end fits over the wing of the petcock. Turning the handle opens the cock, allowing the oil to flow out. This device is particularly desirable as the method of testing allows the operator to reach the high and low level petcocks without soiling the hands or clothing.



Manufactured by the Holton Hood Clip Co., 65 Shelby Street, Detroit, Mich. Prices on request.

"Red Devil" Combination Slip Joint Plier is a tool of great value in making repairs, due to its adjustable jaws, which are suitable for holding objects of an irregular shape, and is especially useful to automobile and truck repairers. The tool is



made of forged steel, having dentyne, knurled handles of the proper shape and nickel plated. The tool also combines with it as a plier, a screw driver and wire cutter. Sizes 6½, 8 and 10 inch.

Manufactured by the Smith & Hemenway Co., Inc., 130 Colt Street, Irvington, N. J. Prices on application.

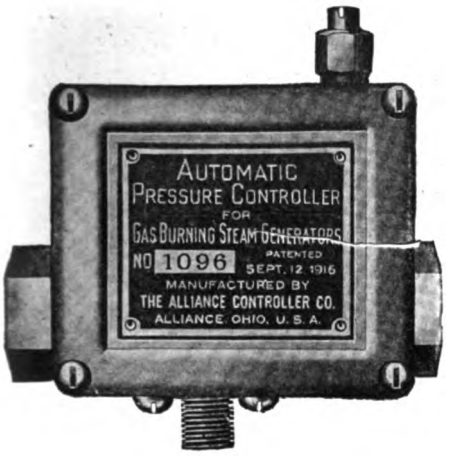
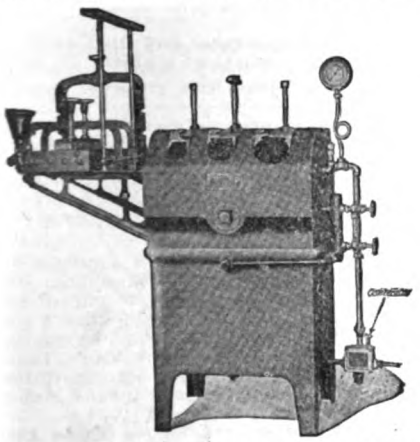
The Alliance Controller for the vulcanizer is said to give absolute control of the steam pressure at the vulcanizer. The device is attached to the gas feed and also to the steam pipe leading from the boiler. When the steam pressure reaches a certain point the gas is automatically cut down, till the falling of the steam pressure allows the gas to be turned on again, allowing the steam pressure to be brought up to the proper point.



The principle is that by using this device the gas fuel for the vulcanizer is kept down to a low consumption point, thus reducing the cost for fuel and at the same time keeping the steam at a steady, even pressure, a point that is much desired in vulcanizing.

Besides the saving in the fuel and the steady steam pressure, the operator is relieved of the duty of turning the gas off and on by hand, allowing him the extra time so gained for doing other work that will be more profitable.

The Alliance Controller is guaranteed to give absolute satisfaction and to accomplish the purpose for which it was intended when installed and adjusted according to instructions which accompany each controller.

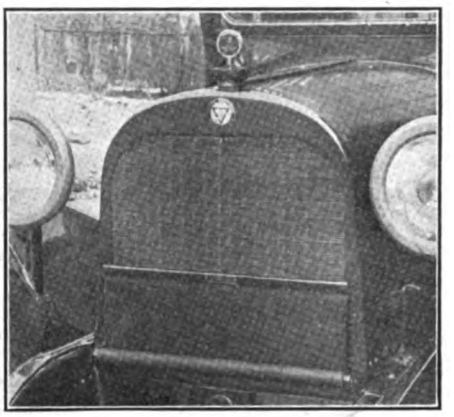


The gas is controlled by valves both at the inlet and the outlet of the controller, so that the control is positive.

Manufactured by the Alliance Controller Co., Alliance, O. Price, $7.50.

The Mayhew Curtain is an adjustable radiator shield of the roller-curtain type, controlled from the driver's seat by a cord running through the dash, over the top of the engine, passing through a tube inserted in the top of the radiator core in an air passage and connecting with the cross bar of the flap at its top.

The flap is fastened to the sides of the radiator by means of supports similar to those used for suspending a roller window curtain, while the roller operates similar to a curtain roller. The flap is raised and lowered and caught at any desired point, as with a window curtain, and may be



raised or lowered when the car is in motion.

The Mayhew curtain is made of the best of materials, but not of as heavy material as the Sutter flap. Its use is primarily for warming up the engine quickly at the start, regaining the heat in the cooling system that is lost when the car is standing.

Manufactured by the Sutter-Mayhew Co., 174 Canfield Avenue, Detroit, Mich. Prices and literature on request.

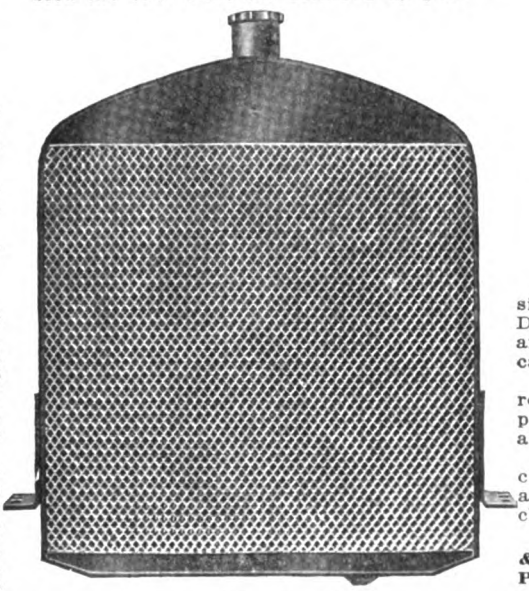
"Comfy-Drivers" consists of two electric hand warming pads for the steering wheel. The pads are laced to the rim of the wheel, one at each side, and connected to the lighting system of the car by two silk covered wires.

Current when the switch is on is obtained from the storage battery when the

car is standing and the generator when the engine is operating at a speed of 12 miles per hour or better. The warming pads are connected in multiple for all ordinary 6-7-volt systems.

Manufactured by the Main Electric Co., Cleveland, O. Price, $5 per pair.

Standard Radiator for Ford Cars is a replacement radiator that combines a larger cooling surface of the honeycomb type with a core that fits the regular Ford shell. It is made throughout of brass material. The tubes are continuous from top to bottom and are made integral with the tank's top and bottom. After the radiator is assembled the tube ends are soldered by pouring melted solder over the face of the core.

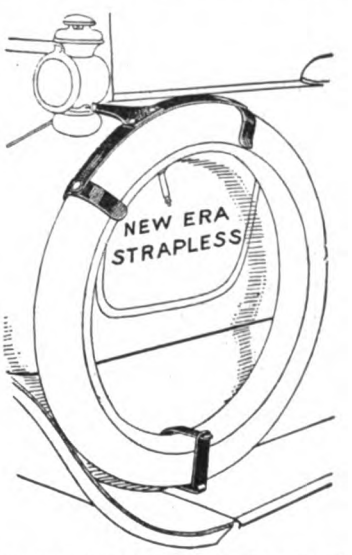


The Standard radiator is sold direct to dealers and large users on a C. O. D. plan and may be returned at the end of five days if not satisfactory.

Manufactured by the Standard Radiator Co., Inc., Springville, N. Y. Prices, radiator complete less shell, one in a crate, $15.50; in lots of five, $15; in lots of 50, $14.50; price of shell, $1.50.

New Era "Instant" Tire Carrier for All Cars consists of a tire carrier for one or two tires attached at the rear of the car body by brackets and a patented locking device that is locked and unlocked in a few minutes time. Fastening chains and unwieldy locks are eliminated, the carrier adding materially to the general appearance of the car.

The Instant Tire Carrier is made in several sizes and for use on all cars, special



sizes being manufactured for the **Ford**, Dodge and Chevrolet cars. These **sizes** are built similar to the carriers for **larger** cars.

Wrenches or tools are not required in removing a tire from the carrier, as the patented lock at the bottom is thief proof and holds the tires securely in position.

The brackets for the carrier are interchangeable from the side to the rear and any forgeman can make the necessary changes in a few minutes time.

Manufactured by the New Era Spring & Specialty Co., Grand Rapids, Mich. Prices on request.

Transmission Bushing Reaming Machine for Ford Gearsets is a device which reams the transmission drums and triple gear, securing perfect alignment by means of the long bearing in the rear of the machine which guides the reamer and prevents any inaccuracy in the work. It is stated that it is possible with this device to overhaul completely the transmission and triple gears in 30 minutes, securing a perfect fit of all bushings in that length of time.

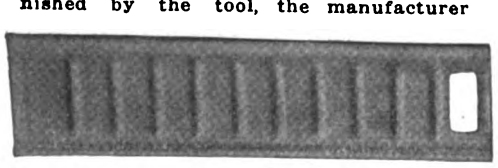
All reamers are especially designed with spiral flutes and do practically all of the cutting on the point of the reamer, the flutes serving to give a final finish by scraping slightly.

Manufactured and sold by the Fairbanks Co. offices in New York and branch in many of the larger cities. Price, complete with reamers for transmission drums and triple gear, $72.

The Auto Lad Three-in-One Trouble Tool is for use when a car or truck is stuck in the mud or the vehicle loses traction. It is small and is carried in the tool box. In case of necessity it is inserted either at the front or rear of the rear wheel, the power is applied and the wheel

regains traction on the corrugated surface of the Auto Lad device.

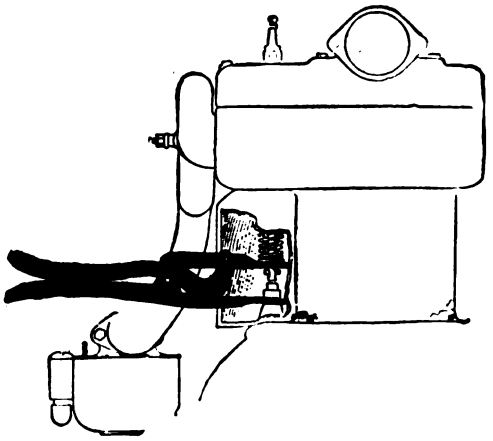
The tool is guaranteed. It may be used as a shovel when so needed. The tool is inserted under the tire for several inches, held by the hand or fastened by a rope. Power is applied and the traction furnished by the tool, the manufacturer



claims, will get the car or truck out of the mud.

Manufactured by the Aisteel Manufacturing Co., 15 Carlyle Street, Battle Creek, Mich. Prices on request.

American Valve Lifter for Ford Engines is a unique device for compressing the spring of the valve and allowing the removal of the pin or key that locks the spring to the valve stem. It is made of malleable iron, occupies but little space in the tool box and when in use automatic-



ally locks, allowing the use of both hands while removing the pin and the valve. It consists of two forked ends, the handles for compressing the valve spring and the automatic locking device. The forked ends slip around the ends of the push rod and the valve, allowing a good grip in compressing the spring.

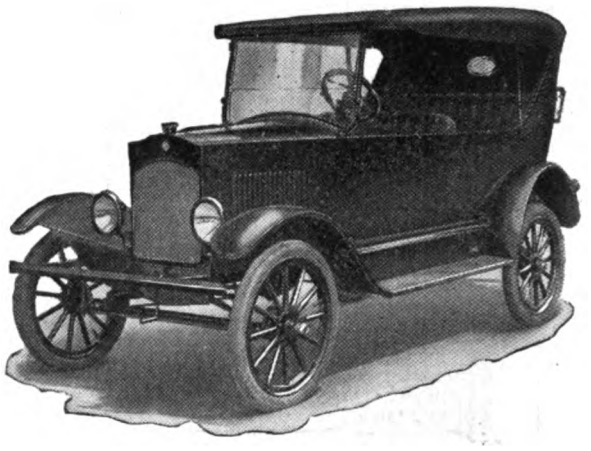
Manufactured and sold by the Fairbanks Co., New York. Price, 60 cents.

The Hudson Crank Case Repair Arm for Ford Cars consists of a cast bracket which, in case of a broken engine support on the Ford engine, may be fitted into place and bolted to the frame of the car and the crankcase of the engine in a few

HUDSON CRANK CASE REPAIR ARM

minutes, making a repair that is at once practical and durable. Brackets are interchangeable and will fit either side. Two bolts fasten the bracket to the engine, while one bolt fastens the bracket to the frame. It can be attached by anyone handy with tools in a few moments.

Manufactured by the Hudson Motor Specialties Co., Real Estate Trust Building, Philadelphia. Price, $1.50.

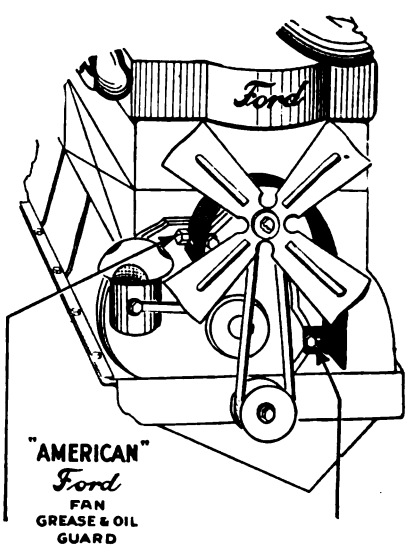


The Autowa Five-Passenger Straight Line Bodies for Ford Chassis are furnished with a one-man top, slanting two-piece windshield, front and rear bumpers, carrier for two tires, special design full crown fenders, side, front and rear dust shields; linoleum covered, metal bound running boards; hood to match the body in color and a special radiator, which is said to have 50 per cent. more cooling capacity than standard.

The Autowa bodies are designed primarily for the motorist who wishes a body of distinctive design which embodies refinements of the larger and more costly bodies. The Autowa is a hand-made body, constructed of well seasoned wood, all joints mortised, glued and screwed and reinforced by irons at every straining point. Autowa bodies are marketed through dealers, but in case there is no dealer near they will be sold direct.

Manufactured by the Ottawa Body Co., Ottawa, Ill. Price complete, $285 f. o. b. Ottawa.

American Fan Grease and Oil Guard for Ford Engine consists of a shield of heavy

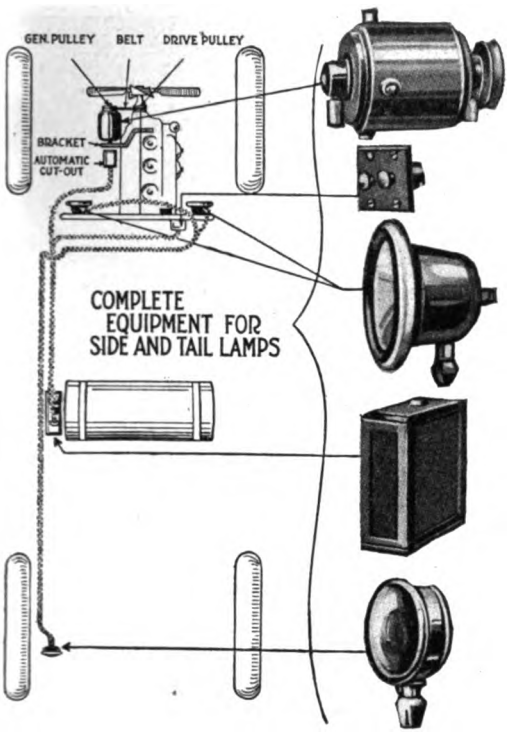


metal that is fastened to the fan support and the base of the engine, and is passed over the top of the fan pulley. The guard is wide enough so that oil or grease is not splashed out at the sides. By its use the interior parts of the hood and the exterior of the engine are kept free from the splash of oil and grease.

Manufactured by the American Valve Tool & Manufacturing Co., 354 West 50th Street, New York. Price at jobbers or direct, 50 cents.

Digitized by Google

Electric Lighting Systems for All Models of Ford Cars consist of a lighting battery, generator for keeping battery recharged, two electric side lamps, electric tail lamp, all wiring, switches and full instructions for installing.



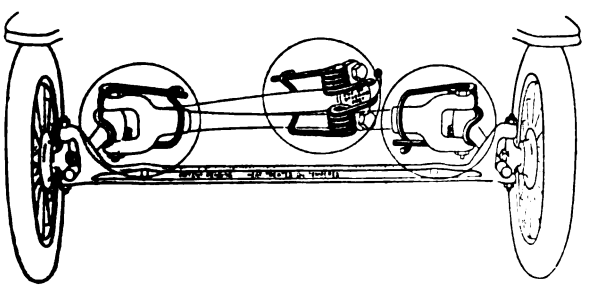
The manufacturer claims that this system may be installed in two to three hours without removing the radiator from the car. It does away with the kerosene side and tail lights entirely.

The generator is belt driven from the crankshaft pulley, the same belt being used to drive the fan. This system provides the Ford owner with a constant and easily operated electric lighting system for his car.

Manufactured by the Puritan Machine Co., Detroit, Mich. Price, $17.50. Some attractive territory still open.

The Handy Steering Arm, Shock Absorber and Anti-Rattler for Ford Cars is a spring device that is attached at the lower end of the steering post between the sector arm and rod and attached to the steering tie rod at each end where the tie rod is fastened to the spindle arm of the axle. The springs are formed of spring steel wire in the form of two springs with a loop in the center, having the ends fastened together by a hook. In placing them, the loop is first slipped over some holding support, such as a spindle arm, the springs positioning themselves at the end of the tie rod, while the ends are fastened around the tie rod. Three springs compose the outfit and the manufacturer claims that this device will stop the rattle of the steering gear, absorb the road shocks at the steering wheel and save the bushings of the front wheel spindles.

Manufactured by the Handy Manufacturing Co., Grand Rapids, Mich. Price on application. Guaranteed and money refunded if not satisfactory after three days trial.



The Groetken Complete Visible Measuring Gasoline Dispenser is equipped with the new Jumbo pump of five-gallon capacity which, it is claimed, can fill and deliver through the visible measuring dome 250 gallons of gasoline an hour.

The Groetken device is a curb outfit, standing seven feet over all, and is built to withstand hard usage. The large Jumbo pump is built to fill the dome rapidly.

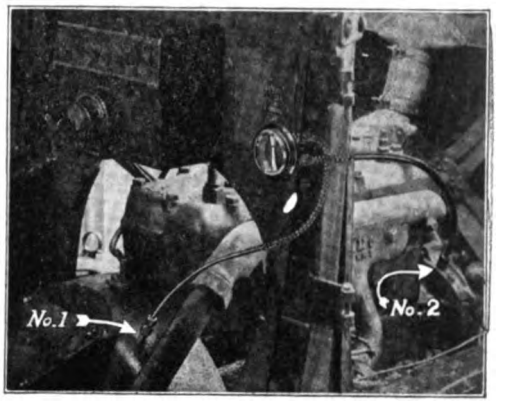
Underground tanks are furnished in two types. One is made of heavy boiler plate, hot riveted and welded, and is furnished in six sizes. The other is constructed of 14-gauge galvanized steel and comes in three sizes.

Manufactured by the Groetken Pump Co., Aurora, Ill. Prices and literature on application.

M-B Dash Oil Sight Feed System for Ford Cars makes use of the principle employed in the Ford, but carries it a step further.

With the device is included a template that is fastened to the top of the transmission cover by means of the two fastening screws, the index of the template giving the exact point at which a hole is to be drilled through the balance wheel case, tapping the flow of oil thrown off by centrifugal force from the balance wheel. Advantage is taken of the centrifugal force and the oil is led by a copper pipe to a sight feed in the dash. From the sight feed it flows by gravity to the timing gear case through a second tube connected by a nipple to the case and fitted in a hole drilled and threaded in the case.

A special fitting is supplied for attaching the tube to the balance wheel housing and this is supplied by the manufacturer, together with the template, dash gauge, piping, instructions, etc. The manufacturer claims that this device will supply the necessary oil for the timing gears and the connecting rods and other interior parts of the engine, even if the regular Ford oiling system becomes clogged. When the oiler fails to operate it is an indication that the supply in the reservoir is low and needs replenishing, and 1½ quarts of oil will be necessary to fill the reservoir to the upper pet cock or gauge level.



The device is easily attached in an hour, it is claimed, and when properly adjusted will show the condition of the oil being used and the amount flowing to the timing gears.

Manufactured by the More-Burdick Manufacturing Co., 5 S. Wabash Avenue, Chicago. Price, $8.50.

Permu Safety Lock for Automobiles and Trucks is a new locking device of the combination type and is fastened to the steering post of the car by a clamp and two screws. The locking arm has two positions, one, when not in use, which allows it to drop down out of the way of the wheel, and the other, when in use, with the fork of the arm fitting around a spoke of the steering wheel. The combination lock is located at one side of the locking arm and is easily accessible for the owner when unlocking.

The manufacturer states that the lock is thief proof, that it cannot be removed by cutting, as the metal used in its construction is hardened steel; that the combination of each lock is entirely different from any other, and that it may be unlocked by the owner in less time than if he had to reach for a key. The lock is not of the tumbler type and a thief accustomed to tumbler locks would find it difficult to open. A record of each combination is kept by the manufacturer and the original number is sent with each lock in an envelope separate from the lock.

Manufactured by the Whittington Manufacturing Co., Montrose, Pa. Prices: Ford cars, $12.50; for all other cars, $17.50.

Rebuilding a Wheel for Pneumatic Tire Installation on a Roach & Kane Multiple Operation Machine: A, Cutting the Spokes and Making the Tenons; B, Boring the Felloe Blocks; C, Dressing the Face of the Rim; D, Dressing the Edges of the Rim.

(Continued from Page 41.)

done and no delays are experienced after the start has been made.

Mr. Feltham's experience has been largely with truck tires. Prior to connection with the Goodyear company he was in charge of the stock room of one of the largest passenger car service stations in Rhode Island, and when he went to the Goodyear branch he found that there was a disposition of the salesmen to devote themselves to passenger car tires because truck tires did not seemingly give the same degree of satisfaction to the buyers.

At that time practically all the truck tires were constructed with fabric bases, and these were pressed on to wheels that were fitted with steel felloe bands. The tires could not be held securely on these bands unless "frozen" by rusting, and many of them loosened quickly after installation and replacement was necessary. Frequently the tires were shed and trucks were delayed until replacement was made.

First Hand Knowledge of Service.

Mr. Feltham believed that with the increase of trucks and the perfection of tires the really big business for tire salesmen would be with truck owners and he undertook to develop the custom of users of trucks. There was but one tire press in Rhode Island, and that was small and manually operated. He found the owners wanted to have tire work done when the trucks were idle and to meet this requirement he sold tires during the business days of the week and worked evenings, Saturday afternoons and Sundays installing the tires he had sold. There were emergency requirements to be sure, but he and other tire salesmen learned very much to their inconvenience that a great deal of their business depended upon their willingness to place their spare time at disposal of their customers. The experience gained by this enforced labor later proved to be very valuable, although the work was regarded as a hardship at the time.

When the change in construction of truck tires, from fabric to steel bases, was made, the first power press was set up at the Goodyear branch, and the owners could be assured of better tires and a much improved service. The number of trucks in use was then such that the work necessary on them could not be done at week ends and there was need of better systematizing it so far as meeting the needs of the owners was concerned.

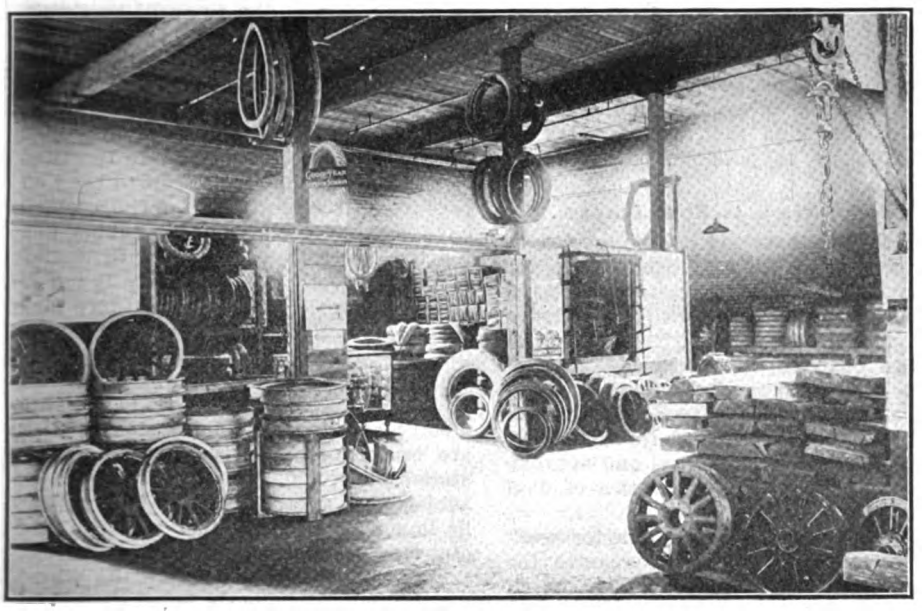
Mr. Feltham's activities in time became almost exclusively with the truck department and it was knowledge of the needs and the existing facilities for truck owners with reference to tire service that impelled him to engage in business.

Station Equipped for General Work.

The equipment of the station was determined to cover the entire range of work that might be obtained. The tire press is a McCall, having capacity of 300 tons pressure, which is more than sufficient to remove or install the largest tires, 42 by seven inches dual being the maximum that has been worked on with this press. The initial cost was greater than that of a smaller press, but there has been no occasion for duplication of press work, which would often happen with a machine of lesser capacity. Instead of using water in the pumpage system of the press the best hydraulic oil was obtained, and besides insuring against deterioration by rust, and against freezing, the thorough lubrication minimized the consumption of electric power, three important factors in press operation and maintenance.

The station service was planned to include wood wheel maintenance, and a shop was equipped with a No. 6 Kane & Roach wheel machine, a band saw and a combination grinder and buffer. The wheel machine was necessary from the fact that wheels subjected to climatic changes shrink and swell and under load and tractive and braking stresses are frequently loose and may, when examined upon removal from a vehicle, require more or less restoration. Or the wheels may be so deteriorated that replacement is necessary. Or the owner may wish to change from solid to pneumatic tires, in which event the diameter of the wheel is reduced by shortening the spokes and

Digitized by Google



Tire Stock Room and the Steel Rim and Band Department and a Corner of the Lumber Store of the Station, from the Center of the Main Floor.

fitting a new rim, and an S. A. E. band or felloe rim installed.

Economy of Combination Machines.

This wheel work must be finished and equal to the original construction, and possibly must restore defects that have developed in service from inferior quality of material or faulty workmanship. The material used in the wheel work must be highest grade and thoroughly dried. The combination machine is decidedly the best for a shop of this kind, where the operations are not continuous, for changes for any one work can be made with practically no loss of time, the cost is low as compared with that of a number of single work machines and comparatively little space is required, yet the shop has what is equal to the facilities of a factory. Necessarily the workers must be highly skilled.

This machine will do any work for a wheel up to 42 inches and it will take a rim 13 inches wide and seven inches thick, which is the largest size that has yet been found practical for trucks. The machine will saw spokes and cut them to length, cut spoke tenons, bore felloe block, dress fellow faces and rims, all of these to scale and pointer settings that insure accuracy. In addition to this the shop has a band saw and a combination buffer and grinder. The other general tools include a drill press, which is serviceable in innumerable works, and a forge and anvil, where fittings of any kind can be made or adapted where there is need of change, and general forge welding of metals done in the event of breakage or other need.

Vulcanizing Shop Equipment.

The vulcanizing shop is exceedingly complete, its equipment including both steam and electric vulcanizing machines. The steam units are Akron-Williams, and these are two in number, the first having capacity for pneumatic tires from three to five inches cross section, and the second a model R having capacity for pneumatic tires from six to nine inches inclusive cross section. The largest pneumatic tires built for trucks are 48 by 12 inches, but these are so rarely used that no provision has as yet been made for sizes larger than those specified.

The electric vulcanizing machine, which has just been installed, can be utilized for any type of pneumatic tire, no matter what the wheel or cross section diameter. Electric vulcanizing is a process very recently developed, which is claimed to afford better results than with steam. It is especially recommended for retreading tires. Statement is made that where the fabric or cord of a tire is not damaged it can be retreaded, no matter what the condition of wear, and that the life after repairing will compare very favorably with that of the original tires.

Quality of Electric Vulcanizing.

With reference to this process, it differs with steam vulcanizing in that a tread that is fully "cured" is vulcanized to the tire casing, and that this does not subject the remainder of the tire section or the tire, which was originally fully cured when made, to another period of extreme heat. Claim is made that when a rubber compound is once cured, as in the manufacture of a tire, a second heating to a curing or vulcanizing temperature will affect its wearing qualities. The second heating to an excessive temperature, such as causes the rubber to become plastic or semi-fluid, is obviated, for the application of the electric heat is between the tread and the tire carcass, and on but a small area of the tire. Not only this, the temperature can be very finely regulated.

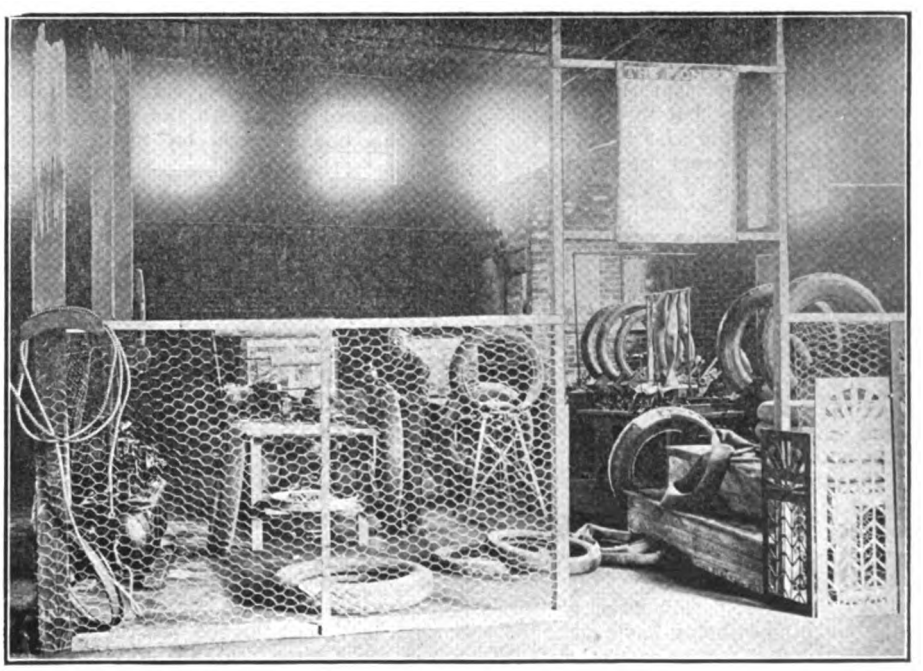
With reference to the use of electric vulcanizing, this process has the approval of the largest manufacturers of tires, and there is reason to believe that it will be found superior for truck tires, which are subjected to heavier loads and consequently the endurance must be maintained at the highest point possible when repairs are made.

Business Established by Hard Work.

The business was not established without hard work and it was in a sense a repetition of the experience with the Goodyear branch in that the business hours of the day were devoted to selling and the tires sold were installed evenings, Saturday afternoons and Sundays, Mr. Feltham doing all of the work he could.

The owners of trucks were first impressed that the object was to afford service that would first of all insure them getting high grade tires, that these tires would be installed to best meet their requirements, and there would be no lost time of the trucks unless through conditions that could not be anticipated.

Salesmanship, according to Mr. Feltham's standard, is not selling truck owners what they think will best serve him, but what the salesman knows will be the most economical when every factor is considered. The buyers are advised of



Part of the Vulcanizing Department, Which is 40 by 80 Feet, and Equipped for Steam and Electric Repairing Tires Up to Nine Inches Cross Section.

Digitized by Google

what types and size in the judgment of the salesman are the best suited for the work done with the trucks.

Truck Tires Seldom Large Enough.

Practically every truck manufacturer equips his machines with tires that are recommended for the weights of the chassis, body and load within certain limitatons, and generally, because large tires cost money, no provision is made for excessive loading. That is, there is no large factor of safety in tires. If the tires are stressed beyond the point of endurance by overloading they are quickly destroyed, and a single overload, hauled but a short distance, may be the cause of rapid wear. If the tires are larger than what would be recommended for a given type of vehicle and weight, the probability of destruction is reduced, as the tires are increased in size.

Fast driving has practically the same effect as overloading, especially if the drive is for a long distance with few or no stops. The condition of the road driven over is a third factor of importance. The care of the driver is another element. If the driver starts with harsh engagement of the clutch, if he accelerates his truck quickly and if he applies the brake sharply the wear of the tires will be excessive as compared with easy clutching, careful acceleration and gradual braking.

The tire that will endure overloading and the other conditions that have been specified must necessarily be larger and will cost more money than those of the truck will of the average factory equipment. Trucks will be sold with any size tire required by a buyer, but with rare exceptions what is known as standard equipment is accepted without regard to conditions because of the first cost, and often this assumed saving is extremely costly, for the difference in price might mean a very largely increased tire mileage and without the losses of the time of the truck for making changes.

Owners Only Consider First Cost.

The truck is sold by the manufacturer as a rule without making provision for exceptional conditions that could result in rapid wear of tires, but the tire salesman ought to know the uses made of the machine and have exact knowledge of the needs and be able to advise the owner. Truck owners will usually endeavor to obtain the last mile possible from tires and will use what good judgment would dictate discarding with the belief they are economizing. When a tire is worn so thin that, as compressed under a load it has no cushioning effect, all shocks are communicated to the mechanism of the machine and rapid mechanical wear follows. There are some conditions, as when driven on smooth asphalt, when the tires can be worn until the flanges of the rims or bases contact with the surface, without damage to the machine, but such roadway is not common.

The average truck owner will wear tires until they are in ribbons or so thin that the machine is being badly pounded and will demand of a service station that new tires be installed without loss of service time, expecting that his patronage is worthy of the entire facilities being devoted to his work whenever it is offered. This demand is practically the same and for that reason there is necessity of having an organization in a station of this kind that will do work as expeditiously as possible, but do good work.

Careful Work Is First Purpose.

In the Feltham station no endeavor has been made to establish records for removing and putting on tires, but the purpose is to do the work as rapidly as is practical. Whenever possible notice of tire changes are asked for, so that there shall be plan made for handling it with the least delay. As a rule from 20 to 25 minutes is required for taking off and putting on a front tire, and approximately an hour for a rear tire of dual type.

When a truck is brought in for work the driver is instructed to remove the wheel that is first to be worked on, if more than one tire is necessary, and bearings are not removed by the shop workers unless the driver or the owner is present. The wheel removed is put on to the press and the work of removal continued as the press is operated, so that there shall be no cessation of press operations as long as these are necessary. After the tire has been taken off the wheel is examined and the condition noted.

Condition of Wheel Is Important.

If the tire is solid and the wheel is not in need of repair the new tire is put on, but not infrequently a wheel will be found in such condition that it may be dangerous to use. The owner is notified and if he sanctions the work a new wheel is taken from stock, the hub and bearings of the old wheel fitted, and the tire put on. This gives the owner practically a new wheel and the cost is low because the work is done in connection with the tire installation. Were this done separately the expense would be considerably more and the loss of service time would add materially to the charge for the tire and tire installation. There are instances, of course, where more or less fitting is necessary, but if the hub is a standard type, with the shop facilities the change can be made very quickly.

In the event that larger tires are to be put on the wheels must be adapted for them and various works are necessary, such as putting on new wheel felloes, new S. A. E. bands, felloe extensions and other means of fitting the wheel and tire. If the change is to be made from solid tires to pneumatics the diameter must be reduced and the spokes cut off and a new felloe made. This work is done by machine and the time is minimized.

Some Obstacles to Fitting Tires.

All sorts of conditions are met in fitting the tires, for occasionally the wheels will need trueing, the felloes may not be to standard dimensions, or the felloe is to be beveled so that the tire base will not have a solid seat the entire width. In such instances the tire installation requires more time and not infrequently there may be necessity of building the felloe diameter with shims or layers of burlap so that the tire will be firmly retained on the wheel.

Some trucks are equipped with steel or malleable iron wheels, which are hollow, and the handling of these must be with equal care to insure the fit of the tires. Instances have happened where the tires have been exceedingly difficult to take off because of irregularity of the rims, which have been dinted through the rubber and the tire bases from contact with an immovable object. Great pressure is necessary to force the tires off, and there may be need of cutting the bases, and before the new tires can be installed the rims must be restored. In some instances this is done by making patterns and forming metal plates to fit the depressions, which are brazed on. The rims cannot be restored by trueing, and they cannot be subjected to great heat. The plates must be immovable and for that reason a bad dint may necessitate a great deal of work that was not apparent before the wheel was off, but is obviously imperative. The great stresses to which tires and wheels are subjected can be realized when a wheel rim may be dinted through from 1½ to three inches of rubber compound and a ⅜ inch steel tire base.

Results of Mechanical Neglect.

Practically every tire installation has some condition where careful judgment is necessary. Not infrequently the wheel spindles or axles are bent, tire rods and spindle pivots worn, wheel bearings loose, wheels out of true, and similar conditions that will cause excessive wear on the tires, and misalignment of wheels is not uncommon. Restoration is necessary if the tires are to be kept so as to give good mileage.

With rare exception every tire will show usage that is advised against by tire experts, and cutting of solid tires by driving in car tracks is often noted. The condition of tires is so important and so much economy is obtainable through careful driving and adjustment, that a system of inspection of the wheels of trucks on which are tires sold by the Feltham station has been inaugurated. An inspector visits the garages where the trucks are kept and takes all the time that is necessary to learn the condition of the tires each month, examining them with an electric torch, for this work is generally done at night.

Each Tire Sold Is Inspected.

An individual report is made for each truck and for each tire, and the record shows the name and address of the owner, make of truck, number, the date and the mileage, and covers good condition, overloading, speeding, car tracks, rough roads, tread cuts, non-skid device and wheel alignment and the influence of these factors upon each tire. In addition to condition the inspector makes recommendation that will in his judgment prevent excessive wear or deterioration.

A copy of the report is sent to the owner. The inspector does not establish responsibility, but directs the owner's attention to conditions as they are found, so that they may be changed and tires conservated. This information is extremely valuable in dealing with buyers, because it is practical to determine all

Digitized by Google

claims for adjustment equitably and with exact knowledge. Owners are impressed with the fact that the one object is to advise them so they will obtain the greatest value, and sales have been refused in instances where the salesmen were convinced that the owners could not obtain practical results unless the tires recommended were used.

The station has several salesmen whose work is principally with truck owners and records of their visits and the information obtained by them are made daily so that precise information with reference to any customer or prospect is always available. These salesmen have cars and with them are able to cover a large area outside of Providence and the towns and cities surrounding it.

Practical Methods of Teaching Drivers.

With the object of educating the drivers and owners to practical tire economies several gatherings have been held at the station Sundays, invitations being extended to them personally and by letter, at which talks have been made by tire experts and work demonstrated, and moving pictures shown to illustrate conditions that every generally obtain and which can be obviated wholly or in part. These "Conservation Days" are held at intervals, and the drivers and owners are encouraged to relate experiences. They are impressed that drivers as a whole are not to be condemned nor criticised, but are to be taught what will be to their advantage to learn. These formalities are followed by lunch and the resources of the station are shown.

Owners of trucks up to 3½ tons are demonstrated possibilities with pneumatic tires, the station having the exclusive agency for the Presto attachment, with which the largest pneumatic tire can be changed on the road by one man as readily as the smallest. This equipment can be adapted to any wheel if the tire rim has one flange and a removable ring, or two removable rings. The rim is split diagonally into two sections and on each of these is welded at one end a notched jaw that fits a short welded-on jaws and studs inside the rim. The rim stud on the other end of the section, the is readily separable by prying out the locking ring, removing one side ring and forcing the jaws off the studs. One short lever is the only tool required.

The rim, when assembled, can be carried with an inflated tire, and with an engine pump a damaged shoe may be changed or the tube replaced, without much labor. If a hand pump only is available a change can be made, but inflation will necessitate work in ratio to the size of the tube. Lifting the tire does not require much effort. The rim can be taken off or put on by a small boy. The Presto attachment must be adapted to the rim at the factory and this requires reasonable time, but once adapted the rim will serve for years. Before the Presto attachment was invented roadside changes of large tires was impracticable without special tools and a good deal of labor was entailed. With it one man can do any work quickly and with less delay than would be necessary with a passenger car tire.

DEVELOPMENTS IN CLUTCHES AND UNIVERSAL JOINTS.

The Merchant & Evans Co., manufacturer of the well known and widely used Hele-Shaw clutches, M. & E. grease cups, etc., whose principal works, warehouses and offices are in Philadelphia, has designed and produced several new automotive devices for which unusual efficiency is claimed.

One of these is the M. & E. oil-tight universal joint, which the company states meets a very obvious demand for such a device. Its great simplicity and strength and the fact that it embodies all of the best points worked out by automotive engineers for war service, renders it ideal for the service for which it is designed. The working parts consist of two hardened and accurately ground bushings, which are driven into two tough steel drop forgings, a block being inserted between the yokes of these forgings for centering and supporting the pins. Very large bearing surfaces have been provided so that the pressure per square inch shall be as small as possible. They are made in four sizes to fit all conditions of work. These joints have been run on tests 22,000,000 turns at speeds of 40 to 200 revolutions a minute, under varying summer and winter conditions, without change or loss of oil or injury to packing.

The Merchant & Evans Co. reports another important development in its new M. & E. dry disc clutches, which are made in two sizes, known as models 10 and 12. These clutches are of the unit power plant type and will go into any open flywheel, and are constructed to fit standard types of S. A. E. bell housings. The light main spring pressure is multiplied by three levers and produces strong spring pressure on the discs. The friction surfaces are large, which adds to the life of the clutch. The adjustment is very simple and is made by a unique arrangement of steps on the cover plate.

Detroit Felt Recent Coal Shortage

The automotive industries at Detroit felt the effect of the coal miners' strike to a greater or less extent, and it is reported that 50,000 to 60,000 men were thrown out of work temporarily by the enforced closing of plants on account of the shortage of fuel. Nearly all the automobile plants of Detroit obtain their power from the Detroit-Edison Co., and it was obliged to curtail the supply to the motor car factories, as they were classified as non-essential industries.

The Employers' Association of Detroit announced its unrestricted cooperation with the power company in the attempt to conserve fuel, until the need for restriction should be over. Among the important concerns affected were the following: Hudson Motor Co., closed until further notice, 6000 men out; Cadillac Co. announced half time schedule; all Detroit plants of the Studebaker Corporation, closed, employing 5000 men; Continental Motors Corporation to lay off 800 men; Federal Motor Truck Co. and Timken-Detroit Axle Co., closed releasing between 5000 and 6000; Dodge Brothers, closed, 18,000 men; Lincoln Motor Co., one department, 800 men; Northway Motor and Manufacturing Co. was ready to shut down; Fisher Body Corporation closed, 14,000 men.

The Maxwell Motor Co. closed a week for annual inventory, but reopened as it had a supply of coal on hand to last for several weeks. The Packard Motor Car officials stated that they would not be immediately affected as they had several days supply and anticipated that the fuel situation would be relieved before this stock was exhausted. The Wilson Body Co. stated that it would be able to keep going, as it gets its power from outside sources and was augmenting its store of coal with wood.

The Hupp Motor Co. made an effort to operate on its own power and avoided laying off 1600 men. Officials of the Ford Motor Co. claimed that they had sufficient fuel to operate their own plant for the immediate future. At Pontiac, Mich., the Oakland Motor and General Motors Truck companies posted notices of indefinite suspension of operations. General Motors officials at Flint, Mich., said that the coal shortage was not yet threatening any shut downs of its factories as the power plant supplies were sufficient to last a minimum of eight weeks. Approximately 25,000 men are employed.

In Detroit, in general, business hours were reduced, train service cut and street cars went unheated.

WILL HANDLE CURTIS TIRES.

The Glouster Supply Co., 1308 Racine street, Cincinnati, O., has taken agency for the distribution of Curtis hand-built tires for Cincinnati and the surrounding territory.

The Curtis tire is built by the Curtis Tire and Rubber Co., Muskegon, Mich. Although up to the present time most of the Curtis tires have gone to large fleet owners, the increased manufacturing facilities have enabled the company to build rapidly for large distribution.

AUTO BODIES AND SUPPLIES.

The Rubay Co., automobile bodies and supplies, has been incorporated with $800,000 capitalization in Delaware by T. L. Corteau, P. S. Drew and M. M. Clancy, Wilmington.

TO DISTRIBUTE TIRES.

The American Tire Distributing Co., New York, has been chartered in Delaware with $200,000 capitalization by George Jason Waters, Wilton C. Salmons and Meyer Morris, New York.

RECORD OF BUILDING OPERATIONS FOR DECEMBER

Contracts Made and Plans Contemplated for Alterations or Erection of Garages, Repair Shops, Service Stations and New Plants.

CONTEMPLATED PLANS AND SPECIFICATIONS.

Birmingham, Ala.; Cruse-Crawford Manufacturing Co.; one-story garage; $150,000.

Birmingham, Ala.; Ike Alder; one-story garage; $40,000.

Haleyville, Ala.; B. J. Cowart; two-story brick garage; $121,000.

Monroeville, Ala.; Mrs. J. L. Wiggins; one-story garage, 60x70.

Montgomery, Ala.; Exide Battery Co.; one-story garage; $14,000.

Scottsboro, Ala.; Jacobs & Soffey; one-story garage; $3000.

Florence, Ariz.; Sam Carlos Garage; one-story garage; $14,000.

Phoenix, Ariz.; P. L. Tregaskes; one-story garage, 50x137; $86,000.

Phoenix, Ariz.; J. W. Stone; one-story garage; $9000.

Bentonville, Ark.; E. B. Gillian and J. A. Vaughan; one-story garage; $10,000.

Fayetteville, Ark.; J. C. Fugitt; one-story garage; $25,000.

Little Rock, Ark.; L. Collomore; one-story garage; $12,000.

Little Rock, Ark.; Benton Hardware Co.; one-story garage, 50x150; $10,000.

Little Rock, Ark.; Standard Garage; one-story garage; $10,000.

Lonoke, Ark.; S. S. Glover; one-story brick and stone trim garage, 100x120; tar and gravel roof, concrete roof; $22,000.

Fresno, Cal.; Devaux Motor Co.; one-story garage, 50x100.

Los Angeles, Cal.; Standard Oil Co.; one-story garage; $63,000.

Los Angeles, Cal.; Muller Brothers; one-story garage; $12,000.

Los Angeles, Cal.; Maxwell-Hoffman Co.; one-story garage, 100x150.

Los Angeles, Cal.; J. F. Hansford; one-story garage, 90x140; $20,000.

Los Angeles, Cal.; Mrs. O. H. Hallam; one-story garage, 75x150; $17,000.

Los Angeles, Cal.; Charles L. Davis Garage; one-story garage; $19,000.

Los Angeles, Cal.; Whiting Co.; one-story garage; $14,000.

Los Angeles, Cal.; Mrs. Cameron E. Thom; one-story garage, 55x150.

Los Angeles, Cal.; F. S. Albertson; one-story garage; $37,650.

Modesto, Cal.; T. J. Wisecarver; one-story garage; $35,000.

Oakland, Cal.; H. E. Osuf; one-story garage; $9000.

Oakland, Cal.; Avilla & Loper; one-story garage; $10,000.

Riverside, Cal.; Keystone Garage; one-story garage; $25,000.

Sacramento, Cal.; A. Elkus and E. Kay; one-story garage; $7000.

Sacramento, Cal.; A. H. Moeller; one-story garage, 80x160.

San Francisco, Cal.; Edward Cerruti; one-story garage; $22,925.

San Francisco, Cal.; Rousseau & Rousseau; one-story garage; $100,000.

Tulare, Cal.; W. D. Ford; one-story garage; $10,000.

Ukia, Cal.; Ukia Garage Co.; one-story garage; $10,000.

Denver, Col.; Frank L. Bishop; one-story garage; $1500.

Denver, Col.; Beatrice E. Turre; one-story garage; $6000.

Denver, Col.; Cadillac Motor Co.; one-story salesroom; $100,000.

Grand Junction, Col.; John A. Spratt; one-story garage; $40,000.

Greeley, Col.; E. H. Auto Supply Co.; one-story salesroom; $10,000.

Holly, Col.; Edward Jones; one-story garage; $20,000.

Holly, Col.; Holly Auto Co.; one-story garage; $20,000.

Lamar, Col.; Lamar City Garage Co.; one-story garage, shop and salesroom; $10,000.

Loveland, Col.; Square Deal Garage; one-story garage; $2000.

Pueblo, Col.; Pueblo Motor Co.; one-story salesroom; $30,000.

Pueblo, Col.; Frank C. Triebes; one-story garage, 82x120; $28,000.

New Britain, Conn.; Municipal Garage; one-story garage; $15,000.

New London, Conn.; Avery Garage; one-story garage, 90x90; $40,000.

Hartford, Conn.; A. C. Hine Co.; one-story garage; $98,000.

Wilmington, Del.; Philip Sklut; three one-story garages; $1100.

Wilmington, Del.; White & Co., 216 N. Broad street, Philadelphia; one-story brick garage, salesroom and service station, 90x150; at 31st and Market streets; $75,000.

Wilmington, Del.; George Seeds; eight one-story garages; $1200.

Jacksonville, Fla.; N. L. Snelson; one-story garage; $10,000.

Jacksonville, Fla.; O. P. Woodcock; one-story service station, 52x105; tile floors, plate glass front; $12,000.

Jacksonvile, Fla.; Jordan Motor Co.; one-story brick salesroom and service station, 50x105.

Jacksonville, Fla.; William A. E. Staver; one-story salesroom, 30x45.

Jacksonville, Fla.; Max O. Schuman; one-story garage; $1800.

Miami, Fla.; South Florida Sales Co.; one-story salesroom; $50,000.

Miami, Fla.; Jenkins & Frey; one-story garage, 45x140.

Miami, Fla.; C. J. Martin; two-story concrete block garage; $10,000.

Pensacola, Fla.; Ford Automobile Agency; one-story garage; $20,000.

Quincy, Fla.; C. R. Shaw; one-story garage, 60x100; $15,000.

St. Petersburg, Fla.; Beard & French; two-story concrete block garage; $3600.

St. Petersburg, Fla.; C. R. Albright; one-story garage and service station; $7100.

Stuart, Fla.; Babcock Garage; one-story garage; $10,000.

Vero, Fla.; Cleman Garage; one-story garage, 50x100.

Americus, Ga.; Will G. Turpin; one-story garage; $25,000.

Atlanta, Ga.; George M. Hope; one-story garage; $50,000.

Atlanta, Ga.; J. Flenan; one-story garage; $25,000.

Atlanta, Ga.; W. H. Brannon; three-story fireproof garage; 175,000 square feet floor space; turntables and other equipment; $500,000.

Columbus, Ga.; Mortin Realty Co.; one-story garage, 74x147; $12,000.

Columbus, Ga.; B. B. Battle; one-story garage, 74x147; $12,000.

Columbus, Ga.; Marshall Morton; one-story garage, 74x147; $12,000.

Crawford, Ga.; Gray Boland; one-story garage; $5000.

Dublin, Ga.; E. S. Street; one-story garage and salesroom, 24x81; $65,000.

Eastman, Ga.; Leroy Pharr and L. H. Reynolds; one-story garage; $10,000.

Ellaville, Ga.; Schby County Motor Co.; one-story brick and concrete garage, 60x100; metal roof, concrete floor; $10,000.

Griffin, Ga.; Automobile Co.; one-story salesroom; $10,000.

Macon, Ga.; Frank Gunn; one-story garage; $22,000.

Pembroke, Ga.; Pembroke Motor Co.; one-story salesroom; $10,000.

Boise, Ida.; Shank Auto Co.; one-story garage, 100x120.

Lewiston, Ida.; Small, Kennedy & Hoyst; one-story garage; $10,000.

Champaign, Ill.; T. N. Smith; one-story garage, 100x110.

Chicago, Ill.; B. A. Gramm, Wayne and Scott streets; two-story garage, salesroom and service station, 70x190, at 2439 Wabash avenue; $150,000.

Chicago, Ill.; Charles Lange & Brother, 2726 Armitage avenue; three-story garage and salesroom, 72x125; $125,000.

Chicago, Ill.; People's Stock Yards State Bank, 1542 W. 47th street; one-story brick garage, 50x85, at Gross avenue and 47th street; $7000.

Chicago, Ill.; A. A. Staverle, 133 W. Washington street; one-story public garage, 98x125, at 4700-6 Kimball avenue; $20,000.

Chicago, Ill.; D. E. Gardber, 1318 Winnemac avenue; one-story private garage, 18x43, rear 1318 Winnenac avenue; $15,000.

Chicago, Ill.; J. E. Ohrenstein, 105 S. Dearborn street; one-story garage, 25x100; $800.

Chicago, Ill.; J. C. Johnson, 1667 N. Famcisco avenue; one-story brick garage, 30x48, at 1519-11 W. Monroe street; $5000.

Chicago, Ill.; E. A. Bondin, 12 W. Garfield boulevard; one-story public garage, 50x235, at 5057-59 Broadway; $30,000.

Chicago, Ill.; Fred Madson, 2018 Lincoln avenue; two-story garage, salesroom and shop, 110x170; at 201 Lincoln avenue; $30,000.

Chicago, Ill.; Gramm-Bernstein Motor Truck Co.; one-story salesroom and service station; $225,000.

Decatur, Ill.; G. W. Weyl; one-story garage; $15,000.

Galesburg, Ill.; John Dakberg; one-story garage; $8700.

Galesburg, Ill.; A. B. Cox; one-story garage; $15,000.

Joliet, Ill.; P. J. Killeen and D. D. Gene; one-story garage, 52x180.

La Grange, Ill.; West Suburban Motor Co.; one-story garage; $75,000.

Lincoln, Ill.; S. D. Jarvis; one-story garage; $35,000.

Litchfield, Ill.; C. Spence; one-story garage, 66x66.

Newton, Ill.; John H. Shup; one-story garage, 60x140.

Newton, Ill.; O. A. Davis; one-story garage, 60x140; $10,000.

Pontiac, Ill.; Carothers & Abbott Auto Co.; one-story garage, 102x117.

Stonington, Ill.; Fred Leach; one-story garage, 50x134.

Springfield, Ill.; Buick Auto Co.; two-story brick and reinforced concrete garage, 50x150; $80,000.

Springfield, Ill.; Ford Service Garage; three-story garage, sales and display rooms, repair shop, service and storage stations, 60x220; $150,000.

Tuscola, Ill.; Thomas Smith; one-story garage, 100x110.

Tuscola, Ill.; Thomas L. Wright; one-story garage, 100x110.

Algiers, Ind.; Robert Motor Co.; one-story brick and concrete commercial garage, 80x100, 221 Saguin street; $30,000.

Bluffton, Ind.; Grove Garage Co.; two-story brick and concrete garage, 35x140.

Fort Wayne, Ind.; W. M. Gazer; one-story garage; $7100.

Gary, Ind.; Dorman & Sykes; one-story garage; $95,000.

Indianapolis, Ind.; A. W. Bowen; one-story garage; $10,000.

Jeffersonville, Ind.; Clifford Bensinger, 346 Spring street; two-story brick and reinforced concrete garage and salesroom, 110x140, at Wall and Maple streets.

Loogootee, Ind.; William Mosier; one-story garage and service station; $5000.

Monticello, Ind.; H. & B. Auto Sales Co.; one-story brick garage, salesroom and service station, 53x165; $50,000.

Montmorenci, Ind.; William Burkle; one-story garage, 60x190; $10,000.

Monon, Ind.; H. & B. Auto Sales Co.; one-story brick and stone trim garage, salesroom and service station, 83x100; $40,000.

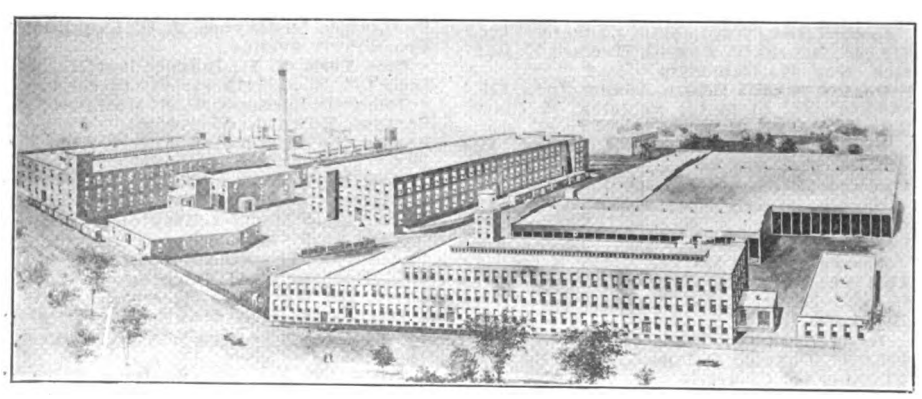
Buffalo Tire Company Is Prosperous

The Madison Tire & Rubber Co., Inc., with factory at Buffalo, N. Y., executive office at 30 East 42nd street and general sales and advertising office at 254 West 57th street, New York City, is one of the newer concerns to engage in the tire industry, having been incorporated in May, 1919, and having commenced the actual production of tires the following August. Its plant at Buffalo is so located as to have the facilities of two railroads with sidings in its own yards. Power is supplied by the hydro-electric service from Niagara Falls, which is not dependent on or interrupted by coal shortage. The plant is stated to be valued at over $1,300,000. The company has issued $2,000,000 in preferred stock and there are, outstanding, 86,600 shares of common stock. Officials of the company state the total present assets to be about $4,000,000. The product consists of the Madison brand of automobile tires and inner tubes, manufactured by the handmade process. The line includes both cord and fabric tires with ribbed and non-skid tread, clincher and straight-side pneumatics, and red and gray inner tubes. The manufacturing facilities are sufficient to jump the production on demand to 1200 tires and 2000 inner tubes a day. All the product is fully guaranteed. The president and founder of the Madison Co. is Rudolph A. Low, who has been in the rubber business since 1880. He is a member of the Merchants' Association of New York, the Russian-American Chamber of Commerce, the United States Chamber of Commerce, the National Association of Manufacturers, the Associated Manufacturers and Merchants, the Automobile Club of America, and many of the better known social organizations. Mr. Low has associated with him the following capable officers and executive heads, all of wide experience in the industry: Max Lowenthal as treasurer; Theodore W. Bassett, vice president; Clarence H. Low, secretary; A. E. Tallmer, assistant treasurer; Dr. Louis J. Plumb, A. M., B. S. (Princeton 1904), chief chemist; Frank H. Brewster, vice president and general superintendent; Williams Myers, superintendent of production; Jean Nehmelman, head of sales department; H. Tyler Kay, in charge of advertising and sales promotion, the publicity being handled, under Mr. Kay's direction, by the Sacks Co., of which C. O. Sacks is president. The general sales policy for the present is to give the exclusive sales rights to one retail tire dealer in each city or defined territory.

The Pennsylvania Rubber Co., Jeannette, Pa., has declared a quarterly dividend of 1¾ per cent. on preferred stock and 1½ per cent. on common, payable Dec. 30 to stockholders of record Dec. 15. This company, which makes the well known Vacuum Cup tires, has been one of the first of the larger manufacturing concerns of the country to take up and advance the "Homes for Workmen" movement. To the south of Jeannette, where the company's big factories are located, it purchased approximately 200 acres of land and called in a corps of expert town planners and architects to develop a model town wherein its workmen might, on easy payments, acquire their own homes. The original plan called for 12 houses, but these were taken with such eagerness that a contract was immediately let for 50 more, with an ultimate goal of 1600 homes. These are up-to-the-minute six and seven-roomed houses, finished in stucco, brick and frame, and containing every modern convenience. The town plan arrangement is being applied to the entire plot, and will include graded and improved streets, a public square, recreation park and community center.

The B. F. Goodrich Rubber Co., Akron, O., is to broaden the scope of its National Touring Bureau, to include the dissemination and distribution of all highway transport data, and has changed its name to the Goodrich Travel and Transport Bureau, and will adhere strictly to the policy of the promotion of highway transportation service and to cooperate with all forms of transportation by land, water and air, in obtaining a more extended and efficient use of their respective facilities. Through its country wide organization of branches, depots and dealers, the bureau has distributed more than 150,000,000 pieces of touring information to the motoring public, this including nearly 5,000,000 road maps, during 1919. Raymond Beck, who acted as field engineer of the United States transport committee during the war, has been chief of the bureau since its inception in 1911, and among the highway transportation experts on the advisory board are Robert C. Hargreaves, formerly secretary of the Highway Transport Committee, and S. V. Norton, Goodrich truck tire sales manager.



Extensive Plant of Madison Tire & Rubber Co. at Buffalo, N. Y.

Rudolph A. Low, President, Madison Tire & Rubber Co.

The Kelley Tire and Rubber Co. has completed plans for the expenditure of approximately $650,000 in West Haven, Conn. The company has bought five acres of land as a site for a new plant. Edward J. Kelley of New Haven is president of the company. He was formerly a railroad official. Charles H. Bortell, Jr., is vice president and treasurer. The company, which is being financed entirely in Connecticut, is capitalized at $1,000,000. It is planned to make 500 cord tires and 1000 tubes daily at the start.

The Stanwood Rubber Co. announces that it has acquired all the capital stock of the Hardman Rubber Corporation of New Brunswick. The Hardman plant, which is being continued under its trade name, was established more than 20 years ago, but is operated under the direction and supervision of the Stanwood company. Lorne A. Scott, former president of the Hardman Rubber Corporation, has been succeeded by William Mackay, president of the Mutual Tire & Rubber Co., who assumes the duties of heading both companies.

The Portage Rubber Co., Akron, O., is to pay on Jan. 1 a quarterly dividend of 1¾ per cent. on preferred stock outstanding and of record Dec. 20, 1919.

The Marion Tire & Rubber Co., Marion, O., has turned over its plant to a corporation which recently purchased it, headed by Ray C. Ellsworth of Akron, O. The capital will be increased from $300,000 to $750,000 and it is also planned to enlarge the plant.

A feature of the exhibit of the Lowe Motor Supply Co., Broadway and 55th street, New York City, in space D-174, at the Grand Central Palace, during the week of Jan. 3-10, will be a display of garage equipment, especially of portable electric tools, such as drills, valve grinders, etc. There will be a four cylinder engine block mounted at its booth, where a demonstration will be given of grinding in valves by using a Stenman electric valve grinder.

FISK CORD TIRES

To the Dealer Who Is Investigating

Where investigation precedes buying, in nine cases out of ten, we gain a new Fisk Dealer. Comparisons alone will sell Fisk Tires—so will records of Fisk mileage. The tires are bigger, better looking, better made. There is one for **every** need—no gaps, no fill-ins—the line and the policy are strong and clean cut.

Our dealer-proposition is attractive—a square deal, prices right and a strong, well advertised line.

For years the **ideal** of the Fisk Rubber Company has been to be "the best concern in the world to work for and the squarest concern in existence to do business with."

Sold direct to dealers and manufacturers

There is a Fisk Branch within 24 hours of all dealers.

American Methods Are Emulated

England is beginning to learn that American methods in the automotive industries deserve emulation as regards both production and service. Many car users have purchased American models not alone because they were more easily procurable, but quite as much because they could be better taken care of when repairs were needed. One illustration will suffice to show the owner's attitude: A British professional man purchased an English car before the war, broke an axle, took it to a service station within five miles of the factory and the car is there yet. He purchased another car, in 1917, of English make, broke a piston, took it to a service station within 45 miles of the factory and that is also there yet. Finally he purchased an American car. Some time later he broke an axle, as in the first car, and in five days his car was running again. These experiences, reported as being common, it is natural that the American car is gaining prestige.

There is another element in the situation, however, that gives the English manufacturer good reason to be anxious about competition by the American car, and that is that the latter today rivals in quality and finish the English product as it did not before the war; hence any hold in the British market secured by the American car is less apt to be lost when the British makers are back in production.

It is not the immediate market in the British Isles alone that is of most concern, but rather in the other dominions of the British empire the American car will have the advantage on account of price and no disadvantage in distance from the factory, even when business again approaches normal. Therefore, to compete abroad with American makers there is a sericus disposition on the part of British manufacturers to adopt mass production methods. This alone will avail little unless they also, as admonished by English writers, match the present vastly superior American methods of dealing with customers.

In the city of Harbin, which is in Manchuria, a ride in a taxicab costs anywhere from 300 to 500 roubles, the rouble being the equivalent of 51½ cents in United States money.

GENERAL MOTORS POLISH AGENT.

Henri Czapticki, representative of the General Motors Export Co. in Poland, who has been in this country for some time, has returned to Europe. Mr. Czapticki announced that he is to establish service stations for the use of the Polish army, now fighting the Bolsheviki, which has taken over 1500 motor cars and the same number of trucks, which were sold by the American government. Mr. Czapticki later intends to extend this service to civilians. He was accompanied by Kasimir Weijchert, purchasing agent of the Polish government.

MOTOR VEHICLES IN MEXICO.

The motor vehicles owned in Mexico City and suburbs which make up the federal district, are classified as follows:

Pleasure cars (private), 2337; pleasure cars (for public use), 1916; jitneys, 1104; motor trucks, 136; total number of cars in Mexico City, 5493; estimated total cars in Mexican republic, 18,000.

It is estimated by dealers in the city of Mexico that only two per cent. of the population of that city are able to purchase cars.

The roads are reported to be in a bad condition and it is said that little is being done to improve them.

FOREIGN TRADE OPPORTUNITIES

Reserved addresses may be obtained from the Bureau of Foreign and Domestic Commerce and its district and cooperative offices upon written request by the opportunity number.

31,402—A firm in South Africa desires to get in touch with manufacturers with a view to securing an agency for the sale of motor cars, electrical or petrol, of a medium and cheap price; also of elevators for passengers and freight.

31,428—An agency is desired by a sales agent in Syria for the sale of motor vehicles, cars and lorries, lumber for building and furniture; textiles, cotton and woolen clothing, knit goods, sole, upper and saddlery leather, imitation leather, steel products, nails, locks and hardware, agricultural machinery and implements, drugs and chemicals, pianos, piano players and phonographs. Quotations should be given c. i. f. Syrian port. Payment, cash against documents at port of delivery. References.

31,451—A broker in Italy desires to secure an agency for the sale of automobiles, tires and accessories and rubber goods. Correspondence may be in English. Reference.

31,488—The representative of a company in Australia is at the present time in the United States for the purpose of buying furniture materials, such as upholstering supplies, motor car trimmings, general and builders' hardware, cabinet makers' supplies, and desires to secure agencies from manufacturers for the sale of American goods in Australia. Reference.

31,498—A firm in Portugal desires to secure an agency for the sale of motorcycles. Correspondence should be in French or Spanish. Catalogues and price lists are desired.

31,503—An American exporting house which has established branches in all the principal cities of the Levant, and maintains show rooms, warehouses and service stations, desires to represent American firms for the sale of agricultural machinery, electrical apparatus, automobiles, etc., and all spare parts and accessories thereto. References.

31,507—A contractor in Greece desires to secure the agency for a new model for a cheap automobile. He will guarantee to sell a certain number per annum. Quotations should be given f. o. b. New York. Correspondence may be in English, French preferred. References.

31,531—A firm in Morocco desires to secure an agency from manufacturers for the sale of passenger and commercial automobiles. Catalogues, descriptions, price lists, time of deliveries and terms of payment are desired. Correspondence may be in English. References.

31,520—A purchasing agent in the United States for a British importing house desires to secure an agency and purchase for sale in Czechoslovakia, automobiles, tires for automobiles and bicycles, canned milk, canned fish, typewriters, glass making chemicals, calicoes, prints and shirtings, dyes and cotton; for sale in Holland, Spain and Italy, automobiles, tires and accessories, and for sale in New Zealand he desires to purchase electrical automobiles, toys, fiber and other cheap rugs and furniture coverings. Quotations should be given f. o. b. New York. References.

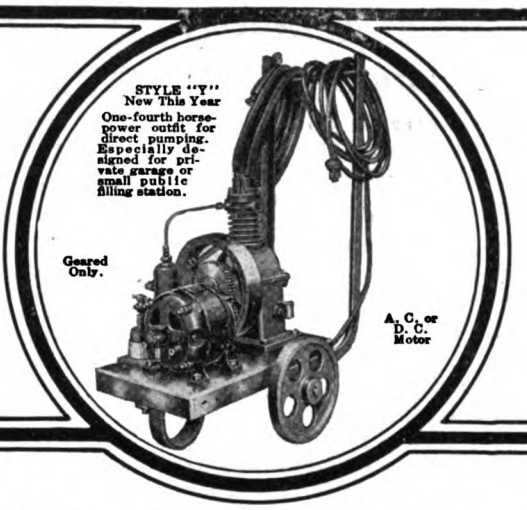
FREE
CURTIS AIR
FREE FROM OIL

The Curtis Sign is 10x14 inches —baked enamel on steel. Furnished FREE with every Curtis Garage Air Compressor—can not be had in any other way.

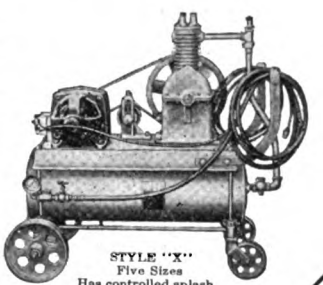


Curtis Free Air Service Brings You New Patrons and Increased Profits

It is generally recognized that compressed air to fill tires frequently carries oil and that this oil has a deteriorating effect on inner tubes. For this reason motorists are discriminating in their use of "free air service"—and are on the lookout for the Curtis sign because they know that Curtis Air is free from oil. It may be that the installation of the CURTIS outfit will be the beginning of a new era of profit-making for you.

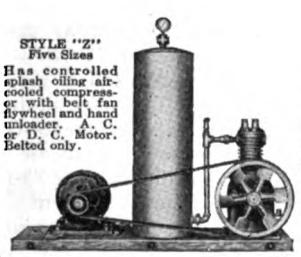
Curtis Air—Free From Oil

Curtis Air Compressors, through a patented construction, prevent oil from getting into the air line—therefore the air delivered is clean, pure and free from oil. The many other exclusive points of superiority, together with the simplicity, sturdiness and dependability of Curtis Compressors make them the popular choice everywhere. With the two new outfits illustrated—Style "Y" and Style "Z"—the Curtis line is now complete, offering a suitable compressor to meet every requirement. Ask your jobber or write us for illustrated literature describing the different sizes and types of outfits.

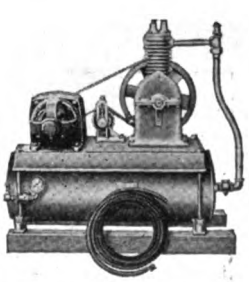


STYLE "X"
Five Sizes
Has controlled splash oiling air-cooled compressor, with belt fan flywheel or with cut flywheel gear. A. C. or D. C. motor. Belted or geared.

CURTIS PNEUMATIC MACHINERY CO.
1621 Kienlen Avenue St. Louis, Missouri
Branch Office: 531-A Hudson Terminal, New York City



STYLE "Z"
Five Sizes
Has controlled splash oiling air-cooled compressor with belt fan flywheel and hand unloader. A. C. or D. C. Motor. Belted only.



STYLE "Y"
New This Year
Five Sizes
Has controlled splash oiling air-cooled compressor, with belt fan flywheel or with cut flywheel gear. A. C. or D. C. motor. Belted or geared.

Curtis Pneumatic Machinery Co.
1621 Kienlen Ave.
St. Louis, Mo.

Gentlemen:
Please send me full details on Curtis Air Compressors — your proposition and prices.

Automotive Activities in Canada

The Dominion Forge & Stamping Co., Ltd., Walkerville, Ont., will concentrate production on drop forgings, as its frame and stamping plants have been sold to the Ford Motor Co., Ltd., Ford, Ont. The Stamping company is installing new machinery and equipment, which will enable it to double its production of drop forgings.

Automobile statistics for the year 1919 covering the western part of Canada will show a marked increase in the registration of cars over 1918, and it is estimated that one person in 14 already owns a motor car in the province of Manitoba alone. At the end of 1918, 121,708 motor cars were in use in western Canada. Saskatchewan had 46,880; Manitoba, about 30,000; Alberta, 29,500; British Columbia, 15,820.

The Nash Motors Co., Kenosha, Wis., intends to establish a branch plant in Canada for the manufacture of motor parts and assembling of cars for the Canadian and British markets. Whitby, Ont., is being considered as the prospective site, where a tract of some 60 acres of land is available.

The Olds Motor Works, Ltd., of Canada, a new General Motors unit established at Oshawa, near Toronto, expects to have its new plant in operation early in the year. All models of Oldsmobile cars and trucks will be produced and the output will be restricted to the Canadian field. The factory building, 80 by 100 feet, consists of three stories and a basement, and has 100,000 feet of floor space. The sum of $450,000 has been appropriated for the construction and equipment of this new unit and the first year's production schedule calls for 5000 cars of all models.

The Montreal automobile and motor truck show will be held the week of Jan. 17-24, in the Grand Palais, Sherbrooke and St. Denis streets. The opening day is one week after the close of the New York show and the closing day coincides with the opening of the Chicago display. The exhibition is to be held under the supervision of the Montreal Automobile Trade Association.

The growth of motoring in Toronto may be estimated from the fact that in a single month permits were taken out in that city for the building of 270 garages, valued at $125,000. One concern, Joseph Price & Sons, has just completed 20 small garages on Main street, and has been granted a permit for the erection of 72 more in another section.

The dominion and provincial governments are all keenly interested in the movement for the construction of a great transcontinental highway from Halifax to Vancouver, on the plan of the Lincoln highway in the States, and an association is to be organized along the lines of the Lincoln Highway Association, pledged to carry out the construction of the Canadian project.

An increase in the capitalization of the Goodyear Tire & Rubber Co. of Canada from $3,000,000 to $30,000,000, has been decided on by the directors. The new stock, if the plan be approved by stockholders, will be divided into half common and half seven per cent. cumulative preferred.

FIAT WINS HILL CLIMB.

The Consuma hill climb, held over the Appenines, in the neighborhood of Florence, Italy, brought out 25 contestants, which made the test in four different classes, and resulted in a victory for a 1914 Grand Prix Fiat. The hill is 9.3 miles in length and is of a difficult, winding nature. The winning car covered the distance in 13 minutes, 38 4/5 seconds, or at the rate of 41 miles an hour. The other winners in their classes were: 5000 c. c. class, Nazzaro, 15 minutes, 43 4/5 seconds; 3000 c. c. class, Bugatti, 16 minutes 54 4/5 seconds; 1500 c. c. class, Verpa, 22 minutes 14 2/5 seconds.

With the exception of a Bugatti and a Benz all the cars were of Italian construction.

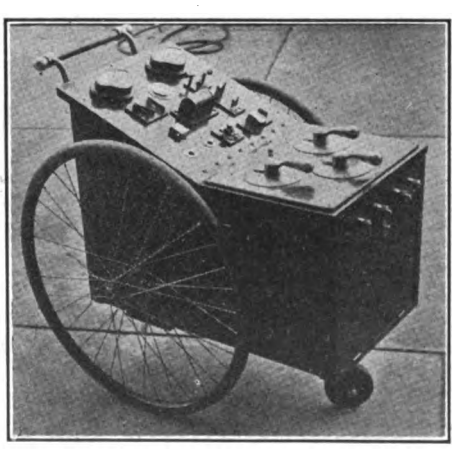
THE NIEHOFF TEST-KART.

One of the latest achievements in the way of a complete testing outfit for locating all electrical trouble in the ignition, starter, generator, battery, wiring relays, meters, etc., is embodied in the Niehoff Test-Kart, which has just been placed on the market by Paul G. Niehoff & Co., Inc., Chicago.

As will be noted, the Test-Kart is portable, the wagon on which the device is mounted being equipped with leads, ready for attaching to any part of the electrical system of the automobile for convenience in locating shorts and grounds. It is not only a time and money saver to garages and electrical service stations, but is also a convenience to the public, as it will enable the repair man to determine the trouble with the car while the motorist waits, consequently the latter can be intelligently informed as to what repair or adjustments will be necessary, and an estimate of the probable cost given.

The storage battery of the device fits into the wagon and all the meters are of Weston make. The list price is $350.

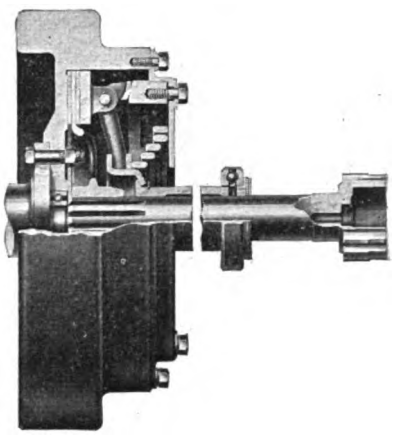
Brooklyn, N. Y.—The Morris Auto Co., Ford dealer, has filed plans for extensive additions to its quarters at 2003 Bedford avenue. The manager is George May.



The Niehoff Test-Kart.

NEW DRY DISC CLUTCH.

The Hoosier Auto Parts Co., Muncie, Ind., has just brought out a new single-plate, dry disc clutch, the Hoosier, which it is making in two general types, unit



Hoosier Dry Disc Clutch.

power and amidship, each in three sizes, including eight, 10 and 12 inch.

The Hoosier clutch embodies a number of special features, including easy and simple adjustment of the friction discs for wear; quick and positive disengagement, eliminating dragging in releasing, and small number of parts used. The design is intended to give great leverage through three clamping levers and makes possible the employment of a lighter spring than is usual in this type of clutch, it is claimed, resulting in easier operation of the foot pedal, and at the same time transmitting the full torque of the motor.

A rather novel feature is presented in the design of the disengaging sleeve, together with its spherical seat within the clamping lever collar, providing, it is said, equal pressure on all three levers at all times, and at the same time automatically taking care of any small misalignment between the transmission and the motor, without permitting any possible binding on the disengaging sleeve, thus giving what is claimed to be a truly "full-floating" sleeve.

The angular seat for the levers is stated to positively center the pressure plate to which the levers are attached, thus preventing chattering when the clutch is being engaged. Slippage after engagement is claimed to be eliminated by the graduated pressure obtained by the peculiar design of the levers.

The Hoosier Auto Parts Co. was established in 1915 to engage in the making of various motor car parts, but it has, for some little time, been devoting its entire efforts to clutch refinement. The officers are: President, George A. Ball; vice president, Karl A. Oesterle; secretary and general manager, Fred J. Lesh; chief engineer and general superintendent, C. G. Wood.

The Gearless Motor Corporation, Pittsburgh, Pa., has acquired land in that city for the erection of a modern assembly building to manufacture steam cars under the MacDonald patents. The plant is expected to begin production early in February.

CRONK SIMPLEX SLIDING GEAR TRANSMISSION for FORDS

A Three-Speed Forward, One Reverse Selective Type Sliding Gear Transmission

This is a new development—a radical refinement of a most practical character—and so it is well worth investigating.

Here we do away with the planetary, with its bands that wear out—that "drag back" on engine power and retard coasting freedom.

We relieve the Ford owner from the mean necessity of using either the low or high gear when conditions call for a better combination of power and speed.

The Cronk Transmission for Fords is a real transmission. It will stand up. Hills and rough roads that heat and wear a planetary transmission on "low" or strain the engine on high, are taken much more easily and efficiently on "second"—and at from 10 to 20 miles per hour at that.

You show a Ford owner this wonderful three-speed transmission. Let him handle the simple "cane shift" in low, intermediate, high and reverse. Show him why he won't have to longer hold down the clutch pedal with his foot for weary miles. Tell him that he doesn't have to court accident by taking bad hills at a high speed. Show him more speed at less expense of fuel.

The Cronk Simplex Transmission for Fords gives the engine its fullest expression of power, flexibility, speed and economy. It gives the driver the same control used on higher powered cars in general.

Design allows for installation of electric starter on old cars in same manner at 1920 cars.

This transmission is a rugged job—oversized nickel steel gears. Can be installed and forgotten so far as future trouble is concerned.

Saves rear axles by eliminating jerks they receive in dropping from low to high. Installation easy—no cutting or machining—just an assembly job.

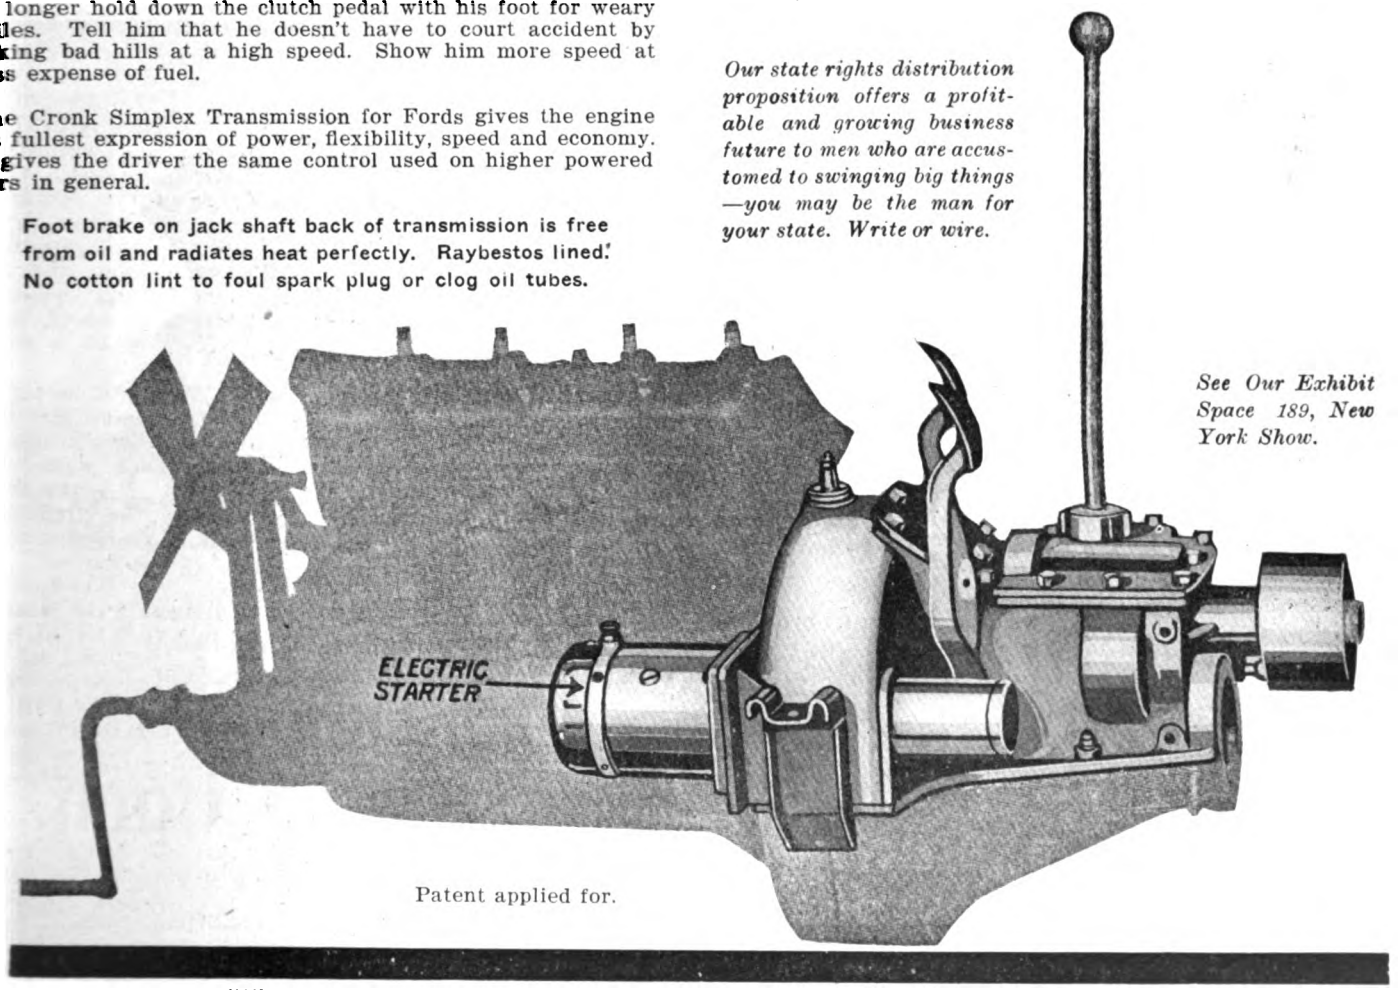
DEALERS—When you get the full story on this transmission the selling possibilities in your territory will become large. Our arrangements with you are made direct and your additional profit on original Ford parts removed is also a big item. Write or wire.

Write for our exclusive State rights distribution proposition. We are looking for men of vision and action.

E. D. & A. F. CRONK, Inc.
Utica, New York

Our state rights distribution proposition offers a profitable and growing business future to men who are accustomed to swinging big things—you may be the man for your state. Write or wire.

See Our Exhibit Space 189, New York Show.



Foot brake on jack shaft back of transmission is free from oil and radiates heat perfectly. Raybestos lined. No cotton lint to foul spark plug or clog oil tubes.

Patent applied for.

YOU CAN JUDGE—HERE ARE THE FACTS

The Over-Land Guide will absolutely hold any Ford car or truck in its place on the road. It will eliminate all wobble, scooting and creeping. It will keep the wheels in alignment. Save the tires from undue wear and protect the entire front system and steering mechanism from shocks, stresses and breakage. It will save parts and repairs and add to the service life of any Ford car or truck—above all else it will eliminate accidents, serious damages and oftimes destruction of the car or truck and the lives of the occupants through breakage or loss of control of the steering mechanism.

It is life, car and truck insurance of the highest order. That is why every Ford car and truck should be equipped with the Over-Land Guide.

The Over-Land Guide will save many times its cost in one year in repairs alone and last longer than the Ford car or truck.

The OVER-LAND GUIDE bolts to the center of the front axle and the center of the spindle connecting rod (or tie rod), securely relieving the vibration and strain in the spindle connecting rod (or tie rod) and the entire front system, and the steering mechanism up to the steering wheel. Can be attached in five minutes by anyone.

The Over-Land Guide removes all strain from the steering mechanism, as well as from the arms and shoulders of the driver.

With the Over-Land Guide the driver can control the steering of the car with the tips of his fingers. When going over the roughest roads, through sand, mud holes, ruts and over car tracks.

With the Over-Land Guide, even should the steering mechanism become broken or fail to work, the car or truck will continue on its straight course until stopped.

The Over-Land Guide affords full protection from blow outs, a common danger when one of the front tires become flat and acts as a pivot, which throws the car to one side, frequently the cause of ditching, collision, destruction of the entire car and the people in it.

With the Over-Land Guide Ford cars or trucks can be driven faster with safety due to the fact that the front wheels will not wobble and scoot, as they are held in alignment, which permits the rear wheels to follow properly.

The Over-Land Guide protects, saves and serves. It is high grade, scientifically designed and made car equipment, that guarantees safety and Ford car or truck service.

The OVER-LAND GUIDE protects these parts against breakage, undue wear and repair.

Spindle connecting rod (or tie rod.) Spindle body arms and bushings. Spindle body and bushings. Ball and roller bearings and hub. Steering connecting rod and ball joints. Steering gear ball arm. Steering post bracket, bushing and bolts. Steering post. Steering gear pinion. Steering gear drive pinions. Steering gear internal gear case and bushings.

Also helps to keep axle from breaking or bending—and may save the entire car from destruction.

THIS BROAD GUARANTEE IS PART OF EVERY SALE.

The Over-Land Guide properly installed is guaranteed to do all we say. Your customers can use it for twenty days, and if at the end of that time they are not satisfied, money will be refunded upon its return.

JOBBERS AND DEALERS:—The Over-Land Guide is a wonder seller. The sales are limited only to the number of Ford cars and trucks in use. Sold under an iron clad guarantee. It is priced right and the discounts are liberal. Write today for proposition and discounts.

THE MEIXELL COMPANY

216 Board of Trade Building INDIANAPOLIS, IND.

(Automobile Sundries Co., 18 Broadway, New York, N. Y. Sole Foreign Agents.)

(When Writing to Advertisers, Please Mention the Accessory and Garage Journal.)

Digitized by Google

(Continued from Page 43.)

to within an inch of the top, leaving sufficient space to enter the name of the customer and the account number.

At the close of the month when the statements are mailed the bookkeeper will enter on this controlling sheet the date and the amount of the account, as:

"March 1st. February account as per statement, $23.75."

Should the customer respond to the statement and come in and settle the account the bookkeeper will then enter on this controlling sheet the credit as:

"March 3rd. Received on February account, $23.75."

This amount is entered in the credit column in red ink. Should the customer, however, only pay a part of the account then there will be entered:

"March 3rd. Credit on account, $15."

The balance of $8.75 will be entered in the balance column. (Note illustrations.)

Copies of Accounts on File.

The copy of all accounts should be also filed for reference, and for this purpose a vertical file should be provided, having as many drawers as may be necessary. Each drawer should be equipped with "A to Z" guides, also "guide high folders" for filing each customer's accounts separately.

These guide high folders have tabs which extend above the body of the folder and upon these tabs are entered the names of the customers whose duplicate ledger sheets are to be filed within the folders. These folders are filed behind the correct guide cards.

This method saves considerable time in referring to old accounts, as all duplicates of any one person's account are filed in one folder. For instance, if there is a customer by the name of Samuel Ramsey his name will be entered on one of the folders and it will be filed behind the guide card "R." When necessary to refer to the duplicate ledger sheets of his account back of guide card "R" will be found the folder in which are all the duplicate ledger sheets of that account.

Each account should be numbered and the number entered upon the controlling sheet following the name of the customer and the controlling sheets arranged alphabetically through the use of index guide sheets. When referring to any certain account turn to the index of the ledger and find the controlling sheet for that particular account, find the number of the account and turn to the account in the ledger.

Information of Credit Customers.

Of course the dealer will have some knowledge of the person to whom he sells goods on credit, especially if his regular customers. However, the dealer should arrange to obtain information regarding any applicant for credit so that he can intelligently decide the application, and obviate losses through bad credits.

For this purpose he should have "Information Cards" upon which he can note such facts as will aid him in determining the advisability of allowing credit to a customer. This card should be four by six inches and ruled so as to provide for entering the information secured, such as the name and address of the applicant, the occupation and business address, whether property owner or not, approximate income, number in family if married, with whom he has had business dealings and references. (Note illustration.)

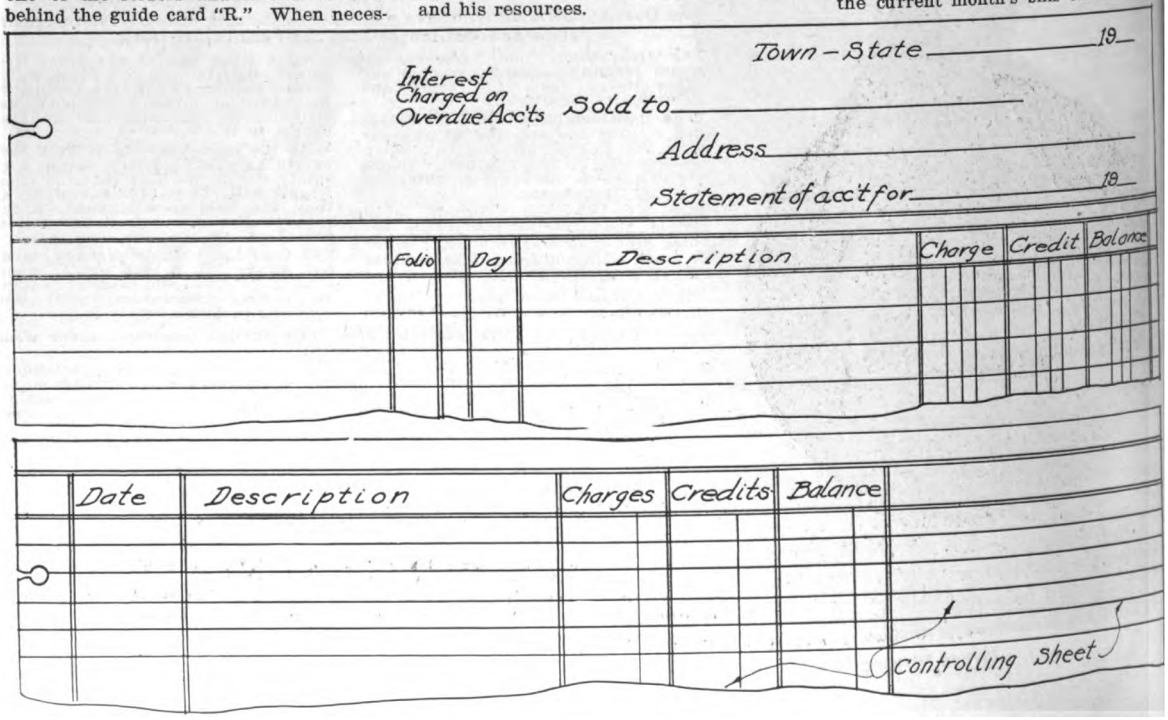
When a customer makes application for credit this information should be required. In the first place the merchant should ask for a personal interview, and during this interview he must endeavor to establish the integrity of the customer and his resources.

The first essential, the integrity of the applicant, the merchant must be able to determine through his powers of observation and his ability to read human nature, and also from the consistency of the facts given him by the applicant. His resources the merchant must find out either from direct questions as to his position, his income and property, etc., or through tact and diplomacy, and draw from the applicant all the information he wants so tactfully that the applicant is unaware of giving it. Which is the best plan each dealer must decide for himself.

Some merchants claim that to examine a man or woman with a series of direct questions regarding resources, income, etc., with a "I know you're dishonest anyway" attitude, does not leave the customer in the best frame of mind. However, the dealer can use the methods of securing information that are most satisfactory. When an applicant seems sensitive the merchant may draw out the information he wants in an indirect way. To do this without seeming to pry into the applicant's private affairs unnecessarily requires considerable tact and judgment. All information, however obtained, should be verified from outside sources.

Emphasize Credit Rules.

After the information has been secured and verified and credit is allowed, no matter to what extent, the merchant should impress upon the customer his credit rules. Every dealer should have his own particular rules, which he should demand that all customers live up to. It may be that all bills are due the 10th of each succeeding month and if not paid by the 10th shall bear interest at the rate of seven per cent., or it may be that the dealer requires his customers to arrange for a further extension of credit in case the current month's bills cannot be set-



tled when due. No matter what the rules, see that they are lived up to in every case.

A card index file should be provided for the information cards after they have been filled and credit given. The merchant should set a credit limit and enter this figure upon his information cards and file for reference. Space at the bottom of each card should be provided for remarks. For instance, a man may purchase an automobile of you on time, the cost amounting to $1350, and he lives up to your terms to the very letter then you will enter this information on your credit card so that should the occasion arise for further credit you can refer to your previous dealings with this man.

In all cases where the amount of the credit is large, as when selling an automobile, or a lot of tires to a sub-dealer, the merchant should always demand a note, a bankable note, with or without interest as the merchant may see fit, until after maturity. If sold upon the plan that the purchase price is to be paid by three equal installments, then he should make out three separate notes, each maturing at a given time. If bankable notes are not secured, in the case of the sale of a machine, then he should require a note together with a mortgage on the machine until the purchase price has been paid.

For the convenient filing of contracts and mortgages the dealer will do well to provide "Document File Cabinets" equipped with "A to Z" guides and the contracts and mortgages may be filed alphabetically therein.

Collections Must Be Systematic.

But the matter of extending credit and promptly collecting the accounts when due are two different things. The real work of the credit dealer is not so much in opening accounts, although that is very important, as they have a direct bearing upon the collections, as keeping in close touch with the accounts and making prompt collections. In collecting the credit dealer must again have tact and discretion and good knowledge of his customers and their affairs to avoid offending them.

If the merchant will lay down certain credit rules and see to it that every customer understands them, and that every customer lives up to them, half his troubles collecting his accounts will be obviated. Every customer should have a copy of the merchant's credit rules, and for this purpose the dealer should have these rules printed and a copy enclosed with each statement mailed. Statements for all accounts should be mailed the evening of the last day of the month and all accounts should be due and payable by the 10th of the following month. All accounts not paid by that date should bear interest at the rate of 7 per cent.

The merchant should always bear in mind that prompt collections has a tendency to increase sales and he should give his accounts uniform attention. A customer whose account is overdue, especially if it is large, may transfer his patronage to another place because he is in fear of being refused further credit

and he does not wish to increase his liability.

It is true that the longer an account remains uncollected the harder it is to collect. Repeated efforts to collect an account without success often irritates a customer and makes him more determined to put off the settlement of it. For this reason the merchant must be insistent in his demand for settlement when the account is due, and, after an honest effort to collect it, should lose no time in placing it for collection through legal methods.

Often a customer can be induced to give the merchant bankable paper in settlement for an overdue account where he is financially unable to raise the money, and in such cases acceptance of this is advisable.

Care in Invoking the Law.

When an account reaches the stage where it is apparent that the customer is attempting to avoid the payment of it, and it becomes a question of getting payment in the quickest and surest way, legal steps should be taken. However, the merchant must first make up his mind that this customer is lost to him ever after that, for once legal action is taken it is a bad policy for a merchant to open another account with such a customer, not only because he has proven himself untrustworthy and unprofitable, but also because a customer once sued by a house is usually itching to put that house in the hole at the first opportunity. Therefore, the merchant should first make up his mind that it is to his interest to close the account in this manner before taking such steps.

Customers can be trained to become prompt in settling their obligations as well as they can be trained to become dilatory, and once the merchant has impressed upon his customers that prompt settlement is necessary for further credit he will have little trouble with charge accounts.

The average customer is honest and when he opens an account with the merchant his intention is to pay, but circumstances may come that make it a little inconvenient for him to settle and if the merchant is a little lax in his demands for settlement the customer may allow the obligation to drag along until finally it is beyond his ability to pay and then he endeavors to avoid its payment.

If merchants would be more strict in their collecting methods very little trouble would result through a proper system. In other words, the merchants themselves create the dead beat through loose methods.

BOSTON DEALERS OPTIMISTIC.

Boston automobile dealers are filled with optimism and enthusiasm and they believe that this year will prove a record breaker in the number of sales. The mild weather has resulted in buyers taking their cars immediately instead of ordering them for future delivery. With a splendid start already the dealers are confident that they will make more money this year than they ever did before.

Smiles greeted the interviewer when he questioned some of the dealers as to the outlook.

"It will be the best year ever," they all agreed.

The wage earner is beginning to show up as a big buyer. Having made money during the war and continuing to demand high wages, he can afford to own a car. And usually he wants a good one; no "flivver" for him.

When a man in working clothes enters a salesroom the salesman takes it for granted that he has come to look over the cars, and gives him just as much consideration as he does the well dressed visitors.

Every dealer in New England is expected to share liberally in the wonderful prosperity that is sure to come to the automobile dealers this year.

BUY GARAGE.

The Universal Garage, 310 Ninth street, S., Minneapolis, Minn., has been sold by C. O. Bergh to D. G. Sheldon and A. J. Barry.

THE year 1920 ushers in what is certain to be the biggest year in the automotive industry. More and better cars will be made and sold. In keeping with the industry's progress, the Stewart-Warner line for 1920 is the most complete ever offered motordom.

During the past year the Stewart Engineering Department and Research Laboratory have labored ceaselessly perfecting and preparing for production the new products that now take their place in the Stewart family.

Better accessories were never manufactured. Each one is truly "custombilt" the Stewart Quality Way. Each one is true to its name—a real "necessity."

The cars produced during 1920 will thus be more universally Stewart-equipped than ever before—and that means something.

Stewart-Warner Speedometer Corporation, Chicago, U. S. A.

PORTLAND REPAIRMEN'S OFFICERS.

The following officers were elected by the Portland Garage & Repairmen's association at its annual meeting at Portland, Ore.: President, Will J. Lester, for three years head of the Portland Y. M. C. A. automobile school; vice president, Virgil Cooper; secretary, H. Nisbet; treasurer, George G. Gerber; two-year members of executive board, A. E. Foss, Fred Dundee; one-year members of executive board, V. C. Undine, A. N. Stanton; vice president for battery and electrical shop department, J. W. Van Matre; for garages, R. D. O'Brien; machine and repair shops, Will Gill; tire repairing shops, J. B. Bailey; paint and trimming shops, Paul Staiger; auto sheet metal and wheel shops, W. R. Raymond.

ACCOMPLISHMENTS OF N. A. D. A. IN 1919.

- Passage of National Motor Vehicle Theft Act, Which Will Effect an Adjustment of Insurance Rates.
- Solution of War Excise Tax Problems and Revision of Truck Chassis Classification.
- Amendments Protecting Dealers Where Violations of Prohibitory Law Are Made by Purchasers Without Dealer's Knowledge.
- Stabilization of Motor Truck Market by Advocating Distribution of Government Vehicles to State Highway Departments.
- Important Service in Connection with Legislative Activities in Various States.
- Participation in Creation of Conference Clearing Committee Composed of Attorneys and Managers of Important National Automotive Bodies.
- Organization and Strengthening of State and Local Automobile Trade Associations.

OBSERVE SUNDAY LAWS.

To test the Sunday blue laws the Automobile Dealers' association of Baltimore, Md., recently decided to sell no gasoline or oil on the Sabbath.

AUTOMOBILE SHOWS CONDUCTED BY DEALERS.

The following automobile shows are to be held under the auspices of various dealers' associations:

Worcester, Mass., Jan. 19-24, in State armory, Worcester Automobile Dealers' association, J. C. Harvey, president and chairman of committee of arrangements; Waterbury, Conn., Feb. 23-28, Auditorium, Automobile Dealers' Association of Waterbury, Ray E. Munger, manager; Brooklyn, N. Y., Feb. 14-21, 23rd Regiment armory, Brooklyn Motor Vehicle Dealers' association, C. M. Bishop, president; Philadelphia, Jan. 10-17, Commercial Museum building, Automobile Trade association, Louis C. Block, president; Little Rock, Ark., March 1-6, Liberty hall, Little Rock Automobile Dealers' association; Wilmington, Del., Feb. 3-6, Hotel du Pont, Wilmington Automobile Trade association, W. A. MacDonald, president; Hartford, Conn., Jan. 17-24, Broad Street armory, Hartford Automobile Dealers' association, Arthur Fifoot, manager; Grand Rapids, Mich., Feb. 23-28, passenger car show, and March 1-6, commercial exhibition, including airplanes, Automobile Business association, W. K. Philp, president; Minneapolis, Minn., Jan. 31-Feb. 7, Minneapolis Trade association; Charlotte, N. C., Feb. 9-13, Show of the Carolinas, Charlotte Automotive Trade association, Lee Folger, chairman; Oakland, Cal., Jan. 19-25, Civic auditorium, Motor Car Dealers' Division, Alameda County Automobile Trade association, Robert W. Martland, manager; Wilkes-Barre, Pa., March 15-20, passenger cars, March 22-27, commercial cars, Armory, Automobile Dealers' association of Wilkes-Barre, Inc., R. A. Rosenkrans, secretary; Scranton, Pa., March 1-6, 13th Regiment armory, Scranton Motor Trades association, Hugh B. Andrews, manager.

BEHLE HEADS CINCINNATI DEALERS.

John Behle has been selected manager of the Cincinnati, O., Automotive Trades association, and will devote his entire time to the work. It is planned to make every automobile and accessory dealer in the city a member of the association.

The association has plans for an active 1920 season.

MOTOR TRUCK EXCHANGE.

A new motor truck organization, representing the truck sales interests in New York City, has been formed known as the Metropolitan Dealers' Motor Truck Exchange, its prime object being to act as a general clearing house for the disposal of used trucks, taken in trade by the members.

The officers and directors are as follows: President, W. H. Moore; vice president, A. C. Harrington; secretary and treasurer, T. D. Pratt, Motor Truck Association of America; directors, W. H. Moore, H. A. Smith, E. N. Stone, C. G. Bond, A. C. Harrington, H. H. Skerrett, W. R. Couch, E. P. Herrman, W. P. Held.

ACTIVITIES OF N. A. D. A. FOR 1920.

- Codification of Automobile Laws of Various States for Purpose of Drafting Uniform Regulations.
- State Motor Vehicle Theft Bill to Operate in Connection with National Motor Vehicle Theft Act.
- Enactment of Pittman Bill Providing for a National Registration Law.
- Establishment of Service Manager's Bureau for Instruction and Classification of Service Managers.
- Inspection and Classification of Automobile Trade Schools.
- Creation of a Traffic Bureau for Auditing Freight Bills, Adjusting Overcharges, Prosecuting Claims for Damages, Etc.

LEHIGH ASSOCIATION TO BUILD.

The Lehigh Automobile Trade association has approved a contract for the building of a headquarters at Rittersville, Pa., and it is expected it will be ready for occupancy by early summer. It has been voted to raise the entrance membership fee from $100 to $200, this including the possession of stock in the association. Fred L. Way of Easton, Pa., was chosen publicity agent.

The contract for the construction of the new building has been let to the Bethlehem Fabricator Co. at $42,000.

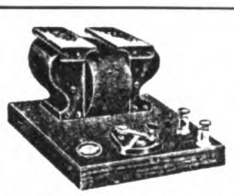
GENEROMETER

The new and practical generator testing instrument. It will locate shorts and grounds in generator armatures where most of the trouble is of a Lighting System. You will need this instrument if you want to be 100% efficient in your electrical repair work. Further particulars upon request.

PAUL G. NIEHOFF & CO., INC.
232 E. Ohio Street, Chicago, Ill.



Niehoff Laminated Magnetizer

This is the most scientific and practical Magnetizer ever constructed. It will magnetize any size magnet from a Ford to all the various other magnets used on the different cars today. Due to the fact that it generates an enormous amount of magnetism, with a pulling power of about 75 pounds, you can more quickly remagnetize a magnet, and, therefore save much current. All magnetizers are subject to considerable wear. The faces will wear down according to their use. The top pieces of our Magnetizer are especially hardened and also detachable so that when worn down they may be replaced at a very small expense. We have two types; one for 6 volt storage battery and another for 110 volt D. C. current. Write for further information.

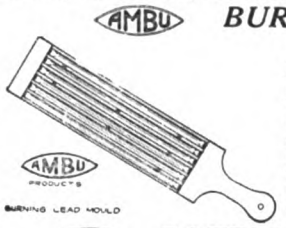
Prices Reduced

The great demand for these three battery shop labor savers has resulted in greatly increased production. Because of this condition we have been able to reduce our manufacturing costs materially—and we are passing this saving to our customers in lowered prices—a novelty in this day of rising costs.

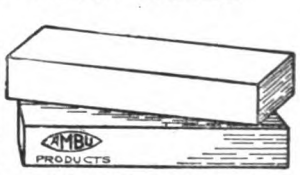
AMBU *BURNING LEAD MOLD*



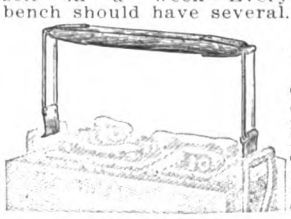
A simple handy mold to put all scrap lead and shavings into usable form. Makes burning lead easy to handle. Pays for itself in saved metal in a few weeks. Used in pairs—one cools while the other is filled. Large shops can use several. Single $1.50. Pair $2.50.

AMBU *BATTERY TURN TABLE*

A roller bearing turn table of hard wood that makes it easy to get at every side of a battery. Not only speeds up work, but saves lifting and turning the heavy battery when burning in plates, sealing or repairing battery.
Only $2.50 and pays for itself in a week—Every bench should have several.



BATTERY TURN TABLE



AMBU *BATTERY CARRIER*

Carry a battery like a suitcase. One man easily carries two batteries. Ideal for lifting batteries from car or replacing.
Price only $1.50 each; per pair $2.50.
Order from your jobber or direct.

When the Engine Flashes "Help!" It's a Sign of Leaky Piston Rings

Install ZELNICKER *Ever-Tyte*
The Piston Ring for All Engines

S. O. S.!! That's a distress signal being flashed to many motorists. It's an earnest call from the power plant warning trouble ahead. A danger signal not often visible from the driver's seat but very plain to you, Mr. Dealer. Why not tell the owner? He needs new piston rings — ZELNICKER *Ever-Tyte Piston Rings.*

Or look at the matter from a selfish business standpoint. *Handle Rings that PAY.* Successful garage men never hesitate stocking Ever-Tytes exclusively. Why? Because they get the long end of the profit. The big margin — the extra percentage. They can *afford* to do a good job. And when you can *afford* to do a thing you do it right and you get *money* and *trade,* both.

ZELNICKER *Ever-Tyte Piston Rings*

net you a bigger profit than some rings list for. You can't beat that. Think it over, seriously. Besides, no better rings can be had. They are Power Guardians that give three for one. Three-piece efficiency with one-piece simplicity.

Guaranteed? Yes — by a Guarantee Bond, more sweeping than you ever heard of before. Iron-clad and lived up to without a word of quibble.

Best of all—they're nationally advertised. Millions have seen them — many motorists are specifying them. Don't wait for the first calls. Resolve to become a money-making Ever-Tyte dealer and — *Do so NOW!*

Install them—on all engines.

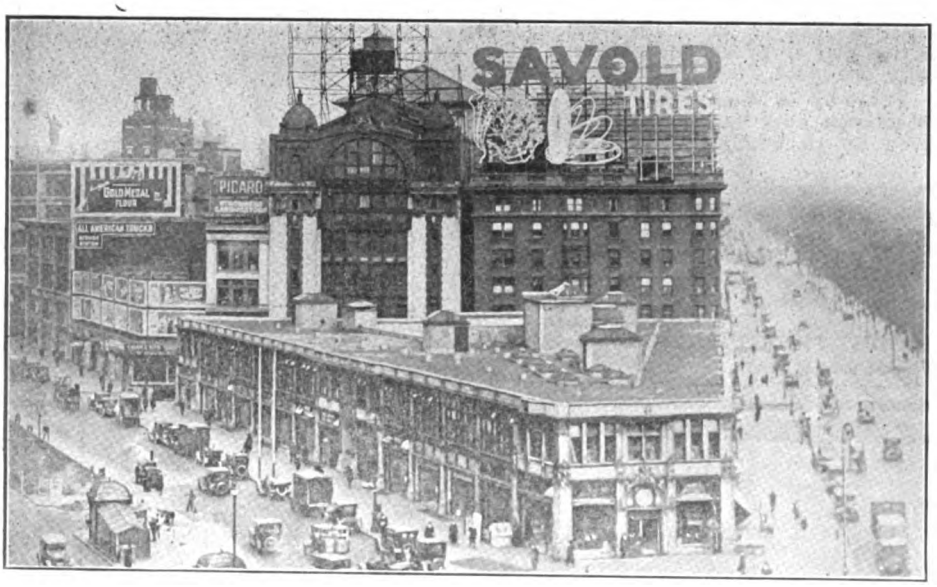
TIRE INDUSTRY AND TRADE

ELECTRICAL DISPLAY OF SAVOLD TIRES.

Standing above the noise and rush of Columbus circle, New York City, is the spectacular electrical display of Savold tires, the story of which is flashed by invisible mechanism through the medium of 4800 electric lights.

Columbus circle is the world's busiest traffic point. More motor cars pass there than any other spot known, the average being 3921 cars an hour. Automobile row, known all over the United States, cuts through the heart of Columbus circle and the eastern tire business radiates from there. Every rubber company and every automobile concern of consequence is represented here, and the exporting influence is carried away to every corner of the globe.

The structure on which the Savold display is supported is 48 feet high and 95 feet long, which is equal to building four stories high. Ten workmen were employed constantly for two months in the construction of the steel frame. It faces head on and can be seen all the way down Broadway and down Eighth avenue. It was designed and executed by the O. J. Gude Co., the originators of the Great White Way, and the Savold tire display is a fitting component to this vast electrical show of the Metropolis. It is estimated that this advertisement is noted daily by more than 325,000 visitors who pass through Columbus circle.



Electrical Display of Savold Tires in Columbus Circle, New York City.

The Firestone Tire & Rubber Co., Akron, O., has broken ground for a mechanical building on a site south of plant No. 2. This will be three stories high and is designed to accommodate the electrical, machine, pipe, carpenter, pattern and tin shops, and will coordinate under one roof all the labor of this nature which has heretofore been done in the various buildings of the factory. It will have a frontage of 325 feet on Main street and a depth of 315 feet. Approximately 80 per cent. of the walls will be glass. The floor will be of wooden blocks laid on reinforced concrete. The cost of construction will exceed $400,000.

The B. F. Goodrich Rubber Co., Akron, O., on Dec. 1, paid to nearly 5000 salaried employees a bonus of 25 per cent. of their annual salary. The total amount paid extra this year was about $2,500,000.

The Interstate Auto and Repair Co., Norfolk, Va., has secured the agency for Racine tires, made by the Racine Rubber Co., Racine, Wis.

The Perfection Tire & Rubber Co. has made arrangements to increase the output of its plant at Fort Madison, Ia., to reach a daily production of 5000 tires.

ORGANIZES MALAY RUBBER CO.

Owen Moynihan, for the past two years general sales manager of the Amazon Rubber Co., Akron, O., has resigned to assume the active management of the

Owen Moynihan, General Sales Manager, Malay Rubber Co.

newly formed Malay Rubber Co. This concern has been organized by distributors and dealers in all parts of the country for the purpose of manufacturing and merchandising high grade tires.

Mr. Moynihan, before his connection with the Amazon Co., was eastern district representative of two of the Akron rubber companies, and before that time he was in the offices of distributors. His wide experience in this field eminently fits him for his new position as general manager of the Malay Rubber Co., in which he will have associated with him tire experts to have the oversight of every phase of manufacture, sales and advertising.

The Malay Rubber Co. will build a complete new plant in Cleveland, O., where a diversified labor market and ideal transportation and living conditions will assist in keeping down production costs. Executive offices have been opened at 1035 Guardian building, Cleveland.

BUFFALO, N. Y. Bell, Tupper 4656

August 11, 1919.

The Stenman Electric Valve Grinder Co., Inc.,
42 Southbridge St.,
Worcester, Mass.

Gentlemen:-

Replying to your letter of August 9th, would say it affords us much pleasure to send you our check to cover the cost of the Electric Valve Grinder sent to us for trial a short time ago.

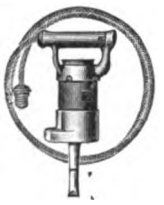
We have no hesitation in stating that we have tried three or four other different makes of grinders, and consider yours much superior to any of them. Its smooth, velvety action enables us to make a much nicer job than any other valve grinder we have tried.

HHH/FM Yours very truly,

HALL MOTOR COMPANY,

By Harry H. Hall

The moral from the above letter, is that you insist on getting a "Stenman" and accept no other. "As good or better" has not yet been made. Your jobber can supply you—if not—write to —us. Circulars on request.



Made under U. S. Patents 876,449 1,313,490. Others pending.

"Will Pay 300%"

The Stenman Electric Valve Grinder will pay 300% yearly on the original cost where it is used to grind but one set of valves a week. If used more the returns will be proportionately greater.

"They Serve Best Who Are Best Equipped To Give Service"

The Stenman Electric Valve Grinder is the greatest time and labor saving tool that ever went into a repair shop. It is eight times quicker than hand work and does a better job. Thousands are already in use and you can depend on this wide use as a guarantee of its worth. Order one today from your jobber. It will have practically paid for itself before the bill is due.

"They profit most who serve best"

KEEP THE CAR ON THE GO!

1894 Est'd. 26 years 1920

REPEAT TIRE SALES are made by real performance. A strong oversize tire is a real saving to the distributor, as well as the user, who seldom calls for an adjustment. Delivery at once.

EXCLUSIVE JOBBERS are cashing in with Miller's improved Tires by **"DIRECT FROM FACTORY"** method, which eliminates high overhead costs. Write today for our exclusive distributors' prices, which makes tire selling more profitable.

Miller's of Anderson Tires. Built up to a mileage leadership and not down to a price. All straight sides, ½ inch oversize. All Ford sizes, ¼ inch oversize.

CHAS. E. MILLER.
Anderson Rubber Works,
1402 Meridian St.,
Anderson, Ind., U. S. A.

The Automobile Journal

Is the oldest Automobile magazine published in America devoted wholly to owners of passenger cars.

A quality magazine, with prestige and circulation that brings results to advertisers.

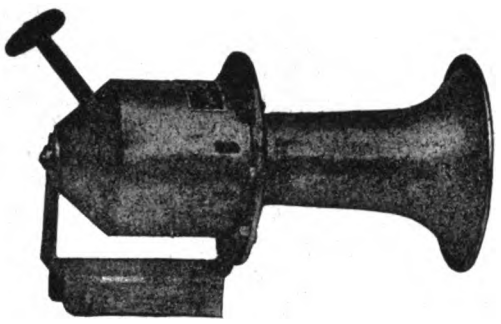
THE HORN WITH 6 EXCLUSIVE FEATURES

Special Sound Projecting Bell



The bell of the STANDARD Auto Horn is made of one piece of steel, solidly pressed and without seams.

There is nothing to retard the sound waves of the STANDARD. Its warning notes penetrate clearly and instantly to a far greater distance than those of other hand horns with ordinary constructed bell.

This exclusive feature alone has brought an unusually large demand for this horn to STANDARD dealers.

The STANDARD has a handsome baked black enamel finish with nickel trimmings. It is guaranteed to outwear any car to which it may be attached.

Horns for Fords are furnished with special clamp bracket without extra charge.

Five Other Exclusive Features

1. Adjustable to any desired tone.
2. Can be operated with one finger.
3. All wear is taken up by adjusting screw.
4. Adjustable to six different positions on car.
5. Guaranteed to outlive the car.

LIST PRICE $4

THE STANDARD AUTO HORN CO.
INCORPORATED
212 Broadway Everett, Mass.

DEALERS Increased production enables us to add a few more dealers to our list. If you are interested in selling a quality horn, moderate in price, but with liberal profit to the dealer, write us.

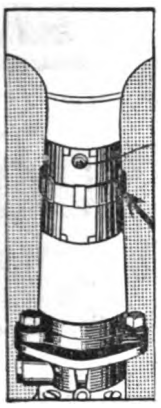
Starts Any Cold Motor In a Jiffy



Attaches to the Intake Manifold or Carburetor Current from battery to a resistance coil in the heater warms the air inside the intake, causing the gasoline to **vaporize** and **ignite** with the **first turn-over** of the motor. Same heating principle as used in the electric flat iron. Gives same result as pouring hot water on the manifold.

This Electric Intake Heater

assures easy and quick starting on the coldest winter day, **and saves drain on battery.** No priming. No delays. Operates from dash switch. Easy to attach. **No drilling or tapping or alterations.** Entirely out of the way. Always ready and perfect in performance. Sold with the distinct understanding that it will give satisfaction when the simple instructions for applying are followed.

If your car or truck has storage battery, write for descriptive matter today. **$3.50**

Dealers and Garages Get Our Proposition.

Electric Intake Heater Co. 130 Cortland St. Jackson, Mich.

DURACORD EXTENSION LAMP

The lamp for rough, hard service. Wired up with 20 feet of genuine Duracord, ready for use. Strong guard and handle, brass keyless socket, handy grip hook and separate plug. Cord cannot pull out of the handle.

Write for descriptive folder.

TUBULAR WOVEN FABRIC COMPANY
PAWTUCKET, R. I.

TRIPLEXD

THE FABRIC TAKES ALL STRAINS

All strain is taken by the tough fabric cover of Triplexd.

The flexible metal lining cannot be damaged.

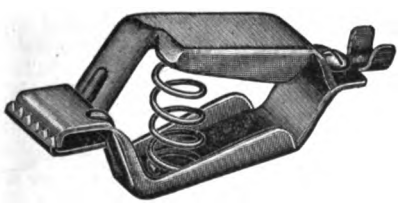
The fabric, woven tightly over a rubber intermediate layer, binds the hose into a leak-proof unit.

Triplexd Pump Hose is guaranteed for one year's service.

METAL HOSE & TUBING CO. INCORPORATED 227 Tillary St. Brooklyn, N. Y.

The metal protects the rubber from gasoline or oil.

UNIVERSAL BATTERY CLIPS

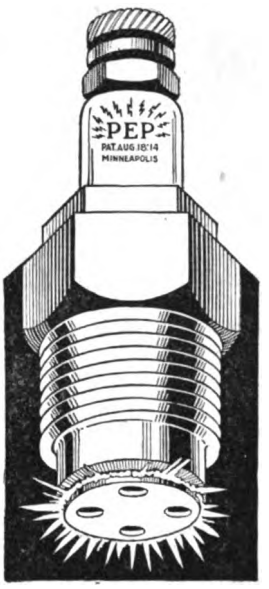


Offer a quick and ready means of connecting storage batteries for charging. Simply fit your connecting cords with these clips and snap them over the battery terminals.

No. 21-A—lead plated—1½" spread of jaws.
Sample mailed postpaid for 15c in stamps.

Single Lots, Each 20c. Lots of 10, Each 15c. Lots of 100, Each 12½c.

R. S. MUELLER & CO., 431 High Ave., Cleveland, O.



REPEAT ORDERS
PILE UP PROFITS

20 repeat orders from one dealer in 90 days.

The Pep Spark Plug will not short circuit from carbon or oil—it is self-cleaning. Greater sparking surface, larger, hotter sparks. Fires in stubborn motors—lame cylinders. Motor starts easier.

Retails for One Dollar

GARDNER AIR PUMPS

Result of 50 years manufacturing experience.

An inefficient air pump makes your air service expensive.
It hurts the quality of your service.
Makes a customer dissatisfied and hurts your business generally.

Install a GARDNER

It will pay for itself in a short time.
It is simple, rugged and efficient.
The fact that many filler stations supplying hundreds of car owners daily use the Gardner air pump is proof that experience had demonstrated it is economical.

THE OHIO CARBON COMPANY

1900 FULTON PLACE, CLEVELAND, O.

Pat. 3-19-'18.

It Finds Ignition Troubles

Attached to Any Plug

Stops All Spark Plug Trouble

Universal and Marvel Spark Plug Intensifiers

The spark is **always visible.** It will make a plug fouled with grease or carbon or with broken porcelain fire perfectly.

When the magneto is not working, a wire short circuited or broken, or the battery out of order, the Intensifier will prove it at a glance. It can be adjusted to overcome almost any ignition weakness. It increases the voltage and spark and makes starting easy. Saves in oil and gas. Adds to power, eliminates carbon and preserves plugs.

Instantly attached to any screw terminal plug and will last as long as the car.

JOBBERS AND DEALERS—This is a wonder worker and sells at a glance. Sold on a money back guarantee. Liberal discounts and prompt deliveries. *Send for full information.*

Security Auto Lock

Affords every protection to Ford car owners that a perfectly designed and extremely well made lock can give. While neat and attractive it is built very strong. In operation it is positive and the car can be left with a feeling of confidence that no one but the owner can use it.

It is the original loose wheel lock for Fords.

It is approved by underwriters.

It will reduce insurance premiums 15%.

When locked the car cannot be towed.

List Price, $6.00

It makes the Ford thief-proof

Anyone can easily install the Security in ten minutes. No drilling, filing, sawing or chiseling necessary. It is made of solid brass. Nickel plated finish.

TO DISTRIBUTORS

When this lock is shown no other will satisfy Ford car owners. It sells at sight. Our trade discounts are liberal and our proposition will interest any one that can sell high grade car protection at a moderate price. ***Write for details today.***

If you can repair and adjust Electrical Equipment, you will get the cream of the garage business and make more money. With the increasing demand for service of this sort, you must equip to handle the business, or lose it to your more enterprising competitor.

Weston

Model 280

GARAGE TESTING INSTRUMENT

is your one great and urgent necessity to enable you to locate electrical troubles quickly and apply the proper treatment to remedy them. Its possession will place you a long way ahead of your competitor not so equipped.

This instrument is extremely accurate, durable and serviceable. It is the most practical electrical equipment you can install.

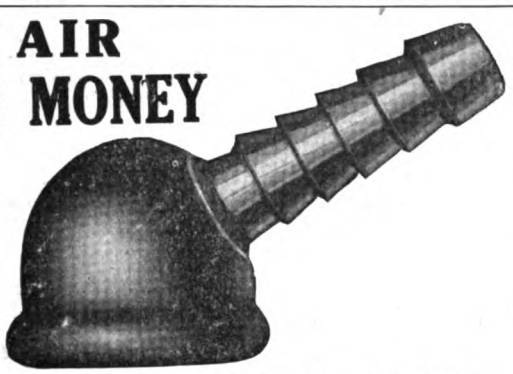
The Weston Company is pre-eminent throughout the world in the production of highest grade Electrical Precision Instruments.

Prompt Shipments from Stock—Order Now!

WESTON ELECTRICAL INSTRUMENT CO., 103 Weston Ave., Newark, N. J.

Call on us at the New York Show, Grand Central Palace, Space D-200

FREE AIR COSTS MONEY



when the customers for whose convenience you provide an air station forget to turn off the flow after they have filled their tires.

Guard against this waste by attaching a

Schrader Universal Inflating Valve

to your air hose.

Thanks to this appliance your bottled air locks itself into the tank the minute it is taken off the tire-valve. You turn on the air by pressing the nozzle of the inflating valve against the tire-valve and you turn it off by removing the device from the tire-valve.

Made to fit any diameter of hose from ¼ in. to ⅝ in.

PRICE $1.50 in U. S. A.

Manufactured by **A. SCHRADER'S SON, Inc.**

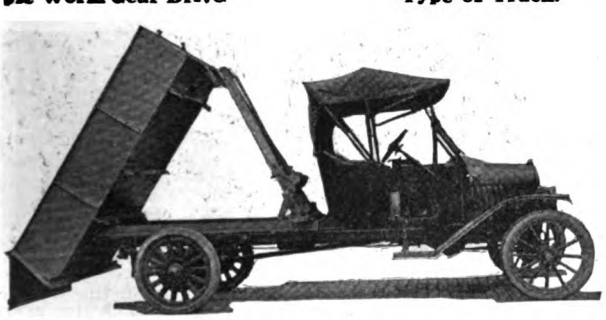
800 Atlantic Avenue, Brooklyn, N. Y.

Schrader products were awarded a Grand Prize and two Gold Medals at the Panama Pacific International Exposition. "There's a Reason."

THE PEERLESS HAND HOIST

Single Cable Quadruple Worm Gear Drive.

For Any Make or Type of Truck.



A wonder in efficiency and speed. It will fit any chassis and body. Weighs but 200 pounds. Simple, fool proof, wholly dependable and will last for years in the hardest service.

Any one that can drive a truck can hoist the heaviest load to 30 or 50 degrees in the longest body in less than two minutes. The smaller the body and load the quicker the action.

But two gears are used, quadruple worm and gear (both machine cut) and housed to protect from dirt and dust. The single cable makes an even pull. Compact and can be installed without drilling holes in chassis frame. The body hitch is also furnished.

We specialize in building all-steel bodies for any need.

Write for complete information.

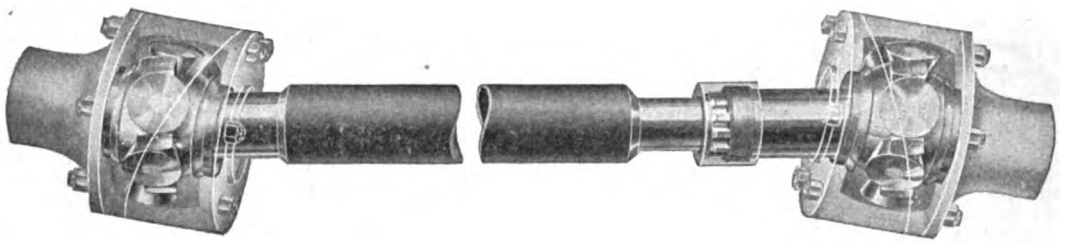
Service Stations Wanted!



R-S Manufacturing Company, makers of the *"REAM"* Universal Joints and Propeller Shafts desire to establish service stations and supply depots in every large city in the United States.

Any garage or repair shop that has or will install a small lathe and can furnish strictly first class references will be considered.

Must be able to finance at least one month's supplies. An excellent opportunity for the right parties. We have a wonderful proposition in the "REAM" universal joint. Our factory facilities are such that we can make prompt deliveries. We give our representatives every possible co-operation.

We make no charge for territory rights and absolutely protect established representatives. If you are interested in a live and high grade proposition write promptly.

The *"REAM"* Universal Joint has the Following Features:

Ball and socket and full roller bearing. No backlash. Does not develop velocity variation. No damage through the agency of end-thrust. Spline end extends through the ball, providing equal pressure on inner and outer end of ball. All traces of whip are entirely removed. No loss of power to deflect. Perfect relative alignment under all conditions. Positively does not waste lubrication. Extraordinary long life. Made entirely from forgings and bar stock. Unequaled and unqualified service.

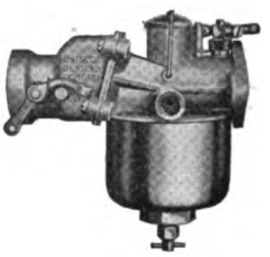
SCOE CARBURETOR

MAKES A FORD RUN LIKE A SIX



SAVES ITS COST IN 60 DAYS

Any dealer who puts a Scoe Carburetor on one Ford, opens for himself a neat and profitable line of business.

Simply because this carburetor enables the Ford engine to perform as nothing else can or will.

Write us to send you the Scoe on our 30 Day Trial Plan. Pay half the net—$4.25—on receipt of the carburetor. Put it on a customer's machine and check up its performance for 30 days.

Then pay the balance, or ask a refund, and we will make it without a question.

That surely is a fair offer, and hundreds of dealers have proved it so.

How about the Part of the Car that is out of Grease

Dixon's Lubricant clings to gear teeth when they are not in motion as well as when they are moving.

Ordinary grease slides off the gears when the car is standing, leaving the metal surfaces unprotected when the car starts.

DIXON'S GRAPHITE Transmission and Differential LUBRICANT

protects your gears all the time.

Put Dixon's Lubricant in your customers' transmissions and differentials. They will feel the difference when driving and gear shifting.

Write for Booklet No. 49-G and prices.

Easy Starting For Fords

You don't have to wear your arm out cranking your Ford in cold weather if it is equipped with a GARDNER THERMOSTAT CARBURETOR.

Just a few turns and you are started. No coughing and spitting for a half hour as with some carburetors because the temperature of the motor regulates the THERMOSTAT and automatically gives at all temperatures the exact amount of gasoline for smoothest running.

Write in today for literature telling how you can get the best operation from your Ford this winter.

We have some excellent territory open for dealers.

TEN Reasons Why The A1 Battery Charging Clip is Superior

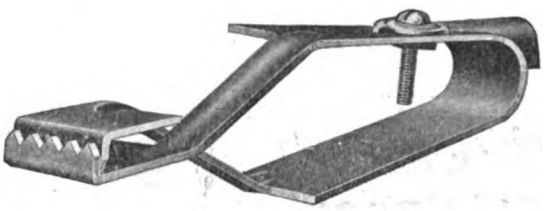
1—Made of the highest grade acid resisting BRONZE.

2—LEAD COATED, adding additional protection from the acid.

3—The only 1 piece clip—gives absolutely conductivity to both jaws.

4—No springs to break and allow clip to fall over and short circuit battery or open charging circuit.

5—The pointed teeth insure positive connection.



6—Jaws of clip open 1½ inches.

7—The long legs allow clip to be used on batteries where connections are close together without danger of shorting.

8—Has a perfect terminal for wire connection which also protects wire from corrosion.

9—The long screw for wire connection acts as a stop, thus limiting the amount of pressure on the hinge of the clip and insures lasting tension.

10—Will outlast other clips several times.

PRICES: Less than 10, 25c. 10 to 100, 23c. 100 or more, 21c.

Send for free sample and be convinced. Sold by all leading jobbers.

KENNEDY AUTO STORAGE COVERS

"Wrap Up" Your Cars When Not in Use

When you store your car for a season, don't let its polish be dimmed by dust, and its metal tarnished before it gets out of the garage. Cover it at once with a KENNEDY AUTO STORAGE COVER, and it will remain as clean and bright as washing makes it, until the cover is removed, next day or next season.

Protects the limousine all summer, or touring cars through the entire winter season. No cost but first cost. Never wear out if care is taken in handling. Insist that your garageman use them.

Popular for Use and Sale in Every Garage

Garagemen—Charge extra for storing with KENNEDY AUTO STORAGE COVERS. Service your patrons are glad to pay for. Many will demand it.

Made of strong, heavy paper, reinforced to prevent tearing. Protects a car against dirt, dust and moisture. Prevents polished portions from tarnishing and keeps finish from checking in cold weather, and also prolongs the life of the tires by excluding the light. Furnished for 5 and 7 passenger gasoline cars, electrics and Ford cars. Good profits in retail sales and service use. KENNEDY COVERS can be sold at a season when trade on other accessories is usually light.

Write for Free Illustrated Literature.

Facts You Should Know About the Wheels of Your Motor Car

In the pages of this publication there will appear a series of talks, fair, impartial discussions of this subject —what you should know and reasonably demand of the Wheels of Your Motor Car.

Much of the extraordinary popularity and success of Disteel Wheels we attribute to the motoring public's increasing interest in and knowledge of motor car wheels as contributing to the security, economy and luxury of motoring.

However, we find from our observations that many motor car owners are still inclined to take the wheels of their cars for granted. Frequently an owner who has almost an engineer's knowledge of the motor, the spring suspension, the electrical equipment, the body design of his car knows little or nothing of the vastly important part the wheel plays in the economy, ease and comfort of his motoring.

In this Series of Wheel Talks we purpose to tell motor car owners some plain, simple truths about wheels. We shall aim only to point out sound, scientific principles; to demonstrate what progress has been made in the design and engineering of wheel equipment and to give the intelligent motorist an understanding of what he can and should reasonably demand of the wheels of his motor car.

When this Series of Wheel Talks has been completed, we shall be entirely content to rely upon the judgment of the American motorist to decide for himself what wheel is the most scientifically designed, scientifically engineered and scientifically constructed.

The first of this Series of Wheel Talks will appear in this publication of February.

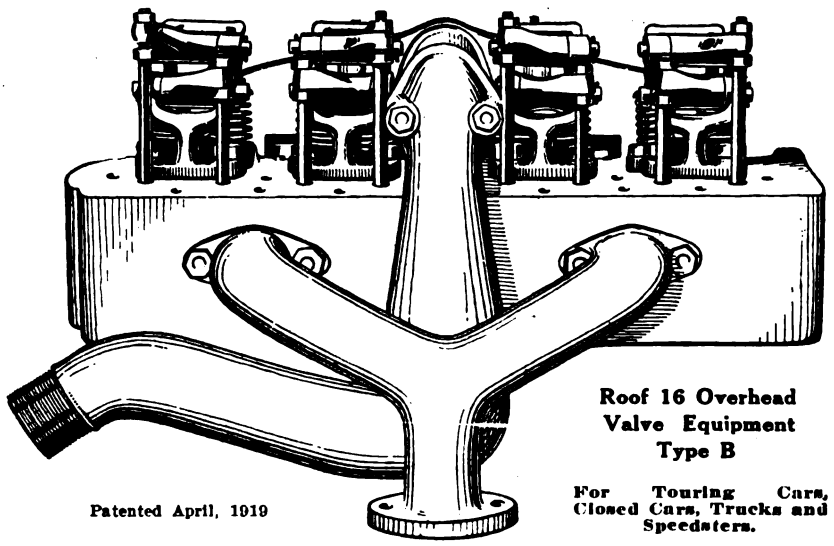
POWER and SPEED ROOF 16 OVERHEAD VALVE EQUIPMENT for FORD MOTORS



Patented April, 1919

Roof 16 Overhead Valve Equipment Type B

For Touring Cars, Closed Cars, Trucks and Speedsters.

The Most Remarkable Power Device, Even in This Inventive Age

Hill climbing for touring cars—pulling power through sand and mud—doubles the hauling capacity of converted Ford truck-speed for mile and half-mile tracks to rival the fastest cars built. Ford racing cars with our Cylinder Head Equipment and special racing parts have attained speeds from 80 to 100 miles per hour. Hill climbing and pulling power for touring cars, closed cars and trucks. Price, compiete, $115.00 f. o. b. factory. Nothing extra to buy. Cylinder head equipment all ready for installation. It takes the place of the regular Ford Cylinder Head. Any mechanic can easily and quickly install it.

Comparison Brake Horse Power Tests at the United States Bureau of Standards gave Standard Ford motor with regulation carburetor 18.7 Horse Power. The same motor with 16 Valve Head and regulation carburetor 22.4 Horse Power. The same motor with 16 Valve Head and Special carburetor 29.7 Horse Power. Recent tests at Bureau of Standards with Type B gave 32 Horse Power. We are Manufacturers and Distributors of speed and other specialties for Ford cars; 3 to 1 gears, high speed camshafts, aluminite, light grey iron pistons, lynite pistons, aluminite connecting rods, racing spark plugs, racing carburetors, roller bearings, counterbalances, wire wheels, multiple speed transmission, high tension magnetos, special oiling system, special worm and gear, steering gear, racing tires, racing bodies, hood and radiator, parts for underslinging chassis. Tell us what you want. We can supply it. Racing quality. Lowest prices. Send for our Complete Literature on how to build fast cars and double the value of your converted Ford Truck and descriptive circular on Speed and other Specialties for Fords.

WAR DEPARTMENT.

WASHINGTON

DEPARTMENT OF MILITARY AERONAUTICS.

August 23, 1916.

From: Ralph Earle, 2nd Lieut., A.S.,S.C.

To: Material Branch, Supply Section, D. M. A.

Subject: Test of ignition devices.

1. Reference your memorandum of August 22nd, the six Alsop Ignition Devices per your order have been received and four of same have been installed.

2. The first device was installed August 20th on Ford car No. 28. The preliminary test consisted of using spark plugs with broken porcelains which had previously been discarded as worthless. By the use of the device the necessary spark was obtained through these heretofore useless plugs, enabling the engine to function perfectly with them.

3. The second test consisted of filling the crank case with twenty-four quarts of oil which filled same, the oil running out of the breathing pipe, and running the engine until all plugs were soaked to such an extent that all cylinders but one ceased to fire. The ignition device was then thrown in and within a distance of two city blocks all plugs began to fire and continued to do so throughout the test.

4. The other plugs were installed and are now in operation. No further special tests were made as the above was considered amply sufficient to demonstrate the efficiency of the devices.

Ralph Earle
2nd Lieut., A.S.,S.C.

This Wonder DEVICE

as one user says, "comes as near making the impossible happen as anything ever seen."

The "Alsop-All-Spark"

WILL PREVENT SPARK PLUG TROUBLES

WE KNOW

It will save fuel and spark plugs—
It will fire dead carbon-choked plugs—
It will cause perfect combustion—
It will guarantee increase of gasoline mileage—
It will do away with changing spark plugs—
It will prevent running engine with a misfire—
It will give a more powerful spark—
It will eliminate carbon and vibration—
It will increase speed and power—
It will fortify any ignition system.

BUT DON'T TAKE OUR WORD FOR IT—HERE IS A GOVERNMENT TEST.

Read it then send for our catalogue of Government Tests and Illustrated Information—or better still send for a device—with money back guarantee. You can install it on any four cylinder car. IT WILL MAKE YOUR CAR RUN AND WILL GIVE YOU A HOT FAT SPARK WHEN EVERYTHING ELSE FAILS. There are no dangerous exposed spark gaps which may set a car afire.

$7.50

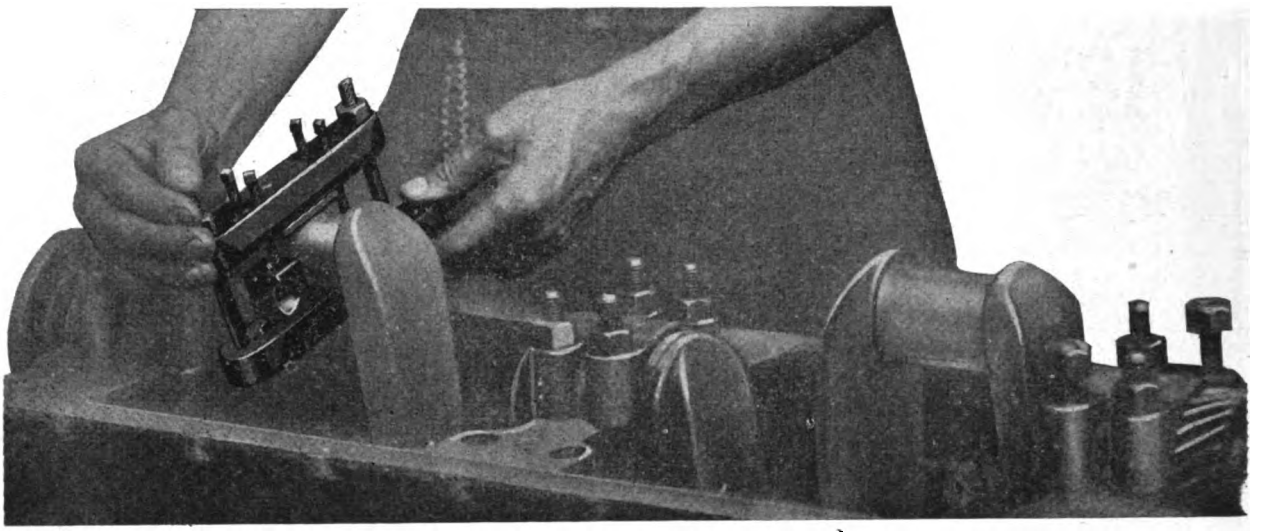
The Quick, Easy and Profitable Way to Grind a Crankshaft



Patented Nov. 11th, 1919

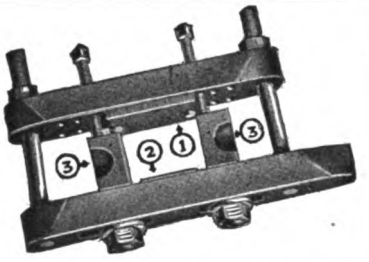
JUST one job pays the cost of Atlas Abrasive Tool **(Patented Nov. 11, 1919).**

No experience required. The Atlas simplifies crankshaft grinding.

No lathe or other equipment required. Use a vise if you like, but remember that the crankshaft need not be removed from the crankcase.

One hour completes the work on any crankshaft.

No machine shop guarantees greater than two-thousandths of an inch accuracy. With the Atlas you get one-thousandth. If you need an Atlas but once a year, it accommodates your customer, puts a good profit in your pocket and gives you a reputation for service.



1. *Hardened and tempered steel-cutter. Cuts in one direction only.*

2. *Bronze track bearings. Cannot cut ring in pin like hard steel nor freeze against pin from friction like soft steel.*

3. *Adjustable Abutment Blocks, which slip easily up against the face of the crank pin and hold the cutter and track in their proper working place.*

Price, complete, with cutter, $10, postpaid. Extra cutters (including bronze bearing tracks), good for from 10 to 20 pins or bearings, 30c each.

Another hand tool would cost from five to ten times the price of an Atlas—you would not get Atlas convenience—nor simplicity of its one cutter principle—nor the saving of time in making adjustments.

Adjustable to crank pins up to 2½ inches diameter for all passenger cars and trucks. Hundreds of garages and repair shops are enthusiastic users of the Atlas Abrasive Tool—it's selling like hot cakes.

A good mechanic would rather part with a $50 bill than with his Atlas, if he could not buy another.

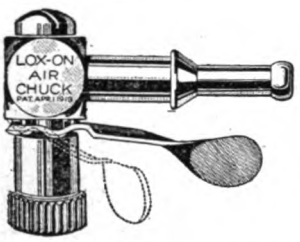
The Signal Success of 1919

LOX-ON TRADE MARK AIR CHUCK
"DOESN'T RUB THE RUBBER"



At last—an air chuck that doesn't leak—that doesn't have to have rubber washers replaced often—and that lasts indefinitely. Garage-men are certain to be enthusiastic over the wonderful improvements in this chuck. Write us for detailed description.

HEAD and shoulders above the new products of 1919 stands the record of the Whistler Pressure Regulator. Written up by the newspapers as a "wonderful boon to motorists" and featured in automobile show publicity, this product has been sold from Maine to California.

Such a marvelous record for a new accessory is a mighty guarantee for the future. It is proof positive that the Whistler has "made good" as one of the steadiest, most consistent sellers in the accessory dealer's store.

The Whistler pays for itself many times over in tire, time and trouble saving. Simply screw it on your regular tire valve. Start the air in. As soon as you have the correct amount, a cheery whistle announces "enough!" You can't put any more in.

What a tremendous improvement over the old bothersome tire gauge. And the Whistler outlasts a car and is always correct.

The Whistler has a strong, well-planned merchandising service back of it. It is a proved money-maker and a certain seller. We will be glad to explain our advertising and dealer propositions. Write us or ask your jobber.

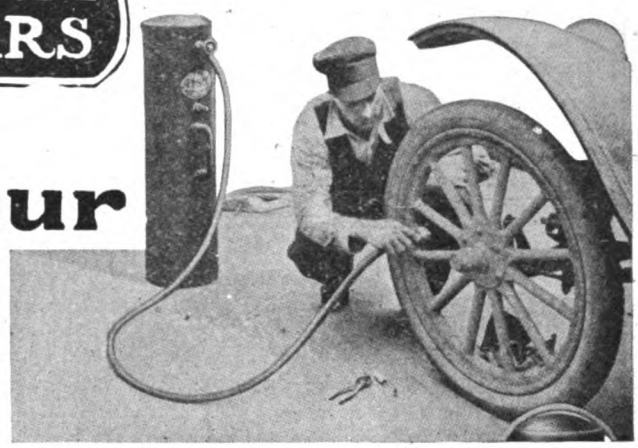
TANK MAKERS FOR NEARLY THIRTY YEARS



Don't Permit Your Repairman to Waste His Time and Labor on Roadside Repair Jobs —

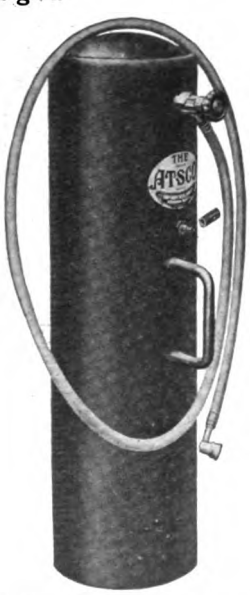
THE ATSCO PORTABLE AIR TANKS

Is A Big Shop Economizer

It increases your profits because it hastens service and better satisfies your customers. It relieves your men for other work. Its utility is as great in the shop as on the road.

The saving made with Atsco tanks quickly pays the cost and there's years of service in each unit. That's the one inducing factor. The saving is continuous.

Atsco tanks are 36 inches length and 10 inches diameter. They are built of steel with genuine copper brazed seams and joints, good for 500 pounds and intended for a working pressure of 250 pounds, and guaranteed air tight.



They are completely equipped with hose and tire valve and connection for filling.

Figure the Cost of Hand Pumping

And there can be no question of the value to you of one or more Atsco tanks. Some service stations have more than a dozen.

We specialize production of garage pressure tanks, and have in stock or build to specification tanks of any size or pressure requirements. Our tanks are used by most of the producers of compressor and air storage systems.

These tanks are genuine copper brazed construction and the seams and joints are far stronger than the stock metal. They will not crystallize or crack and are guaranteed air tight.

We make pumps and pressure tanks for all purposes.

DUFF GENUINE BARRETT JACKS

Released from the Nation's Service

During the recent world crisis, priority had to be granted by the Duff Manufacturing Co. to all orders that involved the war needs of our country and its allies.

The pressure of production at our shops became terrific. It was impossible to fill many orders for passenger car and motor truck jacks.

Fortunately, this condition is now a thing of the past. Production facilities have been increased and the Duff Manufacturing Co. is again in a position to afford its dealers and jobbers the service to which it owed its supremacy as the largest manufacturer of jacks in the world.

Write for information regarding the Duff line of jacks for passenger cars, trucks and garages.

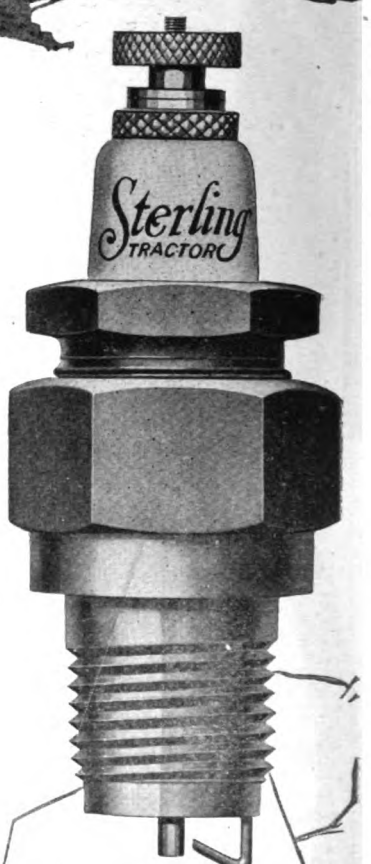
Sterling Spark Plugs



Here's a Sterling Plug For Motor Car, Truck or Tractor

There is a new snap, a new power you will notice as soon as you install Sterling Tractor Spark Plugs in your engine.

These new, strongly-built plugs deliver a spark as sharp and swift as a flash of lightning.

You will note the quick, ready response of your motor with these plugs feeding current to the cylinders. Sterling Tractor Plugs were developed to meet the extreme demands imposed by the high-heat producing internal combustion motors of farm tractors.

Naturally, since they meet the rigorous requirements of tractor engines, they cannot but be all the better for passenger car or motor truck.

Sterling Tractor Plugs are built for heavy duty—for gruelling, continuous work. The porcelain core is unusually heavy; the combustion chamber is extra deep, and the one-piece monel metal electrode will not warp.

Remember, Sterling plugs are separable and easily cleaned. Simply unscrew the gland nut, take out the porcelain core and wipe off the carbon. You can clean Sterling plugs clean.

Progressive garages and supply dealers everywhere sell and endorse Sterling plugs.

GILL
The Perfect One Piece Piston Ring

"The car is going fine since you put these Gill Rings on the motor."

Isn't that the kind of commendation that brings joy to the heart of the garage man? It brings money to his pocket too, for a satisfied customer is a big asset to business.

It is the kind of talk the motorist gives when a set of Gill Piston Rings has been installed on his motor and, naturally, there's a reason for it. Look at the double step interlocking joint of the Gill Piston Ring and you will see the reason at once. An absolutely tight joint, with no loss of compression whether the cylinder is new or worn. The Gill Ring allows an expansion of from 1/8 in. to 3/16 in. before any loss of compression occurs.

Send for the new Gill Piston Ring Size Directory, complete, convenient and full of just the information you need. It is free to the trade.

Performance vs. ?

In selecting a Compressor, what interests you most? Prices? No! Promises? No! Technical details? No! In the end, it is the cost of giving air service. You must have confidence in the concern that sells the outfit, confidence in the manufacture, and confidence in the future performance of the outfit.

Brunner Air Compressors have come to the front in the minds of the progressive garage men of the country. Brunner equipment has won and is holding national leadership as the undisputed standard.

No sales argument, no frenzy of advertising, no freak fixtures could win and hold that dominance. Brunner equipment has construction care that spells Performance. And, Performance merits leadership.

Brunner engineers use the laws of pneumatics ---they know the intricacies, complex problems and possibilities---after years of study and putting these laws into practice their resultant products give consistent economical Performance.

Write for illustrated folder, displaying all types and sizes.

Filtered Air

A REAL service to motorists—a service that will bring them to your door—again and again—that will keep them your customers—that will build the utmost good-will for your business. That's what "FILTERED AIR" will mean. It will increase your business surprisingly. A "FILTERED AIR" sign above your door will keep you in constant touch with all classes of motorists, creating an obligation on their part to become your customers.

The No. 7 AU-TO AIR COMPRESSOR furnishes an abundance of perfectly filtered air. A special liquid takes out absolutely all dust and oil—the two worst enemies of tires. The air comes from the tank as pure and clean as from a mountain top.

This is a complete outfit in itself: motor, piping, valves, gauge, automatic unloader, automatic switch and tank—assembled and ready to run. The motor is only ½ horse power. This outfit requires no watching, no tinkering—the tank is kept full of filtered air, ready for motorists—day and night. This outfit furnishes a regular working pressure sufficient to handle the largest pneumatic truck tires.

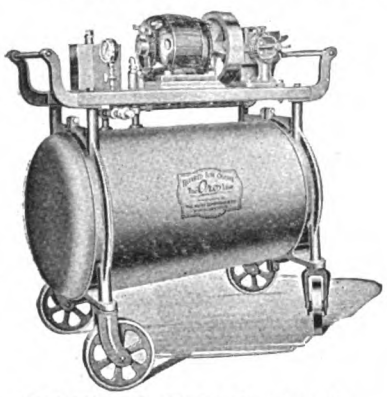
Only 3 Moving Parts!

In addition to the valves there are only 3 moving parts to the compressor mechanism. Such astonishing simplicity must mean durability and continuous satisfactory service. Of course, our regular guarantee of perfect service goes with this machine.

Ask your jobber, or write us, sending his name, if he cannot supply you. Now is the time to get this excellent business builder!

THE AU-TO COMPRESSOR CO.

303 S. Mulberry Street WILMINGTON, OHIO



Model No. 8 Au-To Air Compressor —same as No. 7, excepting that it has large wheel casters, which make it easy to move from place to place in the shop or garage.

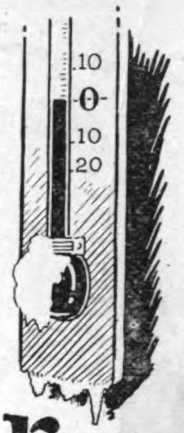
In Zero Weather Remember The COPLEY PRIMER



THE COLDER THE WEATHER THE BETTER THE COPLEY SELLS

When you see a car or truck with a dead engine in a cold garage or on the road you can always count one more certain buyer of a Copley primer.

Burning up the batteries and back breaking cranking will not help. Cold weather and a poor grade of gasoline can beat any combination EXCEPT a Copley Primer.

WITH A COPLEY PRIMER ANY ENGINE CAN BE STARTED INSTANTLY IN ANY WEATHER AND WITH ANY GRADE OF GASOLINE.

The cost is small and the utility and service constant and positive. The Copley is easy to attach, requires no attention and affords results that make it a real car necessity.

Every Copley user is a booster. Every sale brings new customers. It is a business builder and a money maker for all dealers. It is easily the record selling item of the year.

Standard Equipment on Mitchell and Templar Cars

With a low grade of gasoline, it is almost impossible to start a motor in a cold garage on a winter morning or an engine when left standing long in the open. The present gasoline will not evaporate in cold air and there is no carburetor designed that will vaporize it.

When Copley equipped, the motor is turned over, either by hand-crank or starter, the suction of the engine draws a stream of air at high velocity through a small venturi tube where it picks up a quantity of gasoline from a special nozzle. This mixture is converted into a rich, thoroughly atomized gas, which ignites in the cylinders as readily as the mixture in a warm motor.

Unlike other primers, the Copley Primer does not merely inject a small quantity of raw gasoline into the manifold. It not only fires the first cylinder that gets the charge, but is CONTINUOUS IN ACTION as long as it is held open, and will even run the motor without the help of the carburetor.

Write at once for our proposition.

What AMAZON *Means to Dealers*

DEALERS find Amazon Tires profitable to handle because Amazon Tires become a real "hobby" with their users. They continue to sell them because Amazon users have come to know what Amazon rubber means.

Amazon Tires have the same sturdiness as the native up-river Para rubber that goes into them. They have all the live rubber qualities found in the highest degree in the upper Amazon district where rubber tree growth is natural and most luxuriant.

This accounts for the sturdiness of Amazon Tires—for their ever increasing demand—for the success of Amazon dealers everywhere.

Dealers: Increased production now enables us to add a limited additional number of accounts. Write today for our proposition.

Here's Good Winter Business—Equip Fords with Dyneto NON-Stallable Starting & Lighting Outfits

Dyneto TRADE MARK REGISTERED

Sell a high grade, dependable Starting and Lighting System—one that is proven to have "big car" quality. Dyneto—a NON-Stallable Starting and Lighting System for $85. (With a good dealer profit.)

The System is complete, with motor-generator, storage battery, battery box, all wiring, switches, brackets, sprockets, etc., etc. Can be easily installed.

It has the same characteristic features as the Dyneto system that has been used continuously since 1913 on America's highest priced light weight car, the Franklin.

Makes Fords NON-Stallable

The big advantage of this system over others is that it makes the engine NON-Stallable. If too sudden application of clutch brings motor to stop, Dyneto instantly takes hold and starts it—**automatically—driver** doesn't have to press a button or move a lever.

In emergency, Dyneto is powerful enough to move car out of danger, without the motor.

The Steatite Insulator

No extremes of heat and cold can break this insulator. It is proof against electrostatic puncture. It will stand against physical shocks that would shatter the porcelain in plugs you now sell.

This is a blunt plain statement of fact—a long proved claim, standing alone in the whole field of spark plug manufacturing endeavor.

And now note the electrode design

The needle point central member sheds the slightest particle of oil before it can reach the spark gap—the double curved ground electrode is also designed to reject the oil before it reaches a point where sparking heat could decompose it.

Carbon formation is therefore impossible and so the Liberty Spark Plug needs no cleaning—it takes care of that job itself.

With the unbreakable Steatite Insulator no short circuit is possible—the electrode arrangement prohibits carbon—the simple but correctly designed parts assembly guarantees against compression leak.

The Liberty Spark Plug is a business maker. It will work on and on to the lasting satisfaction of every car, truck or tractor owner who selects it as a replacement. It is a plug of distinction made to sell to super-critical buyers.

The list price is $1.50—Our trade propositions will appeal to jobbers and dealers—Write or wire.

LIBERTY

Digitized by Google

A Dome of Strength

DEALERS—*Aside from the service The Liberty Spark Plug guarantees its users, you will find that its very appearance holds a strong appeal. Sturdy and oversized, it "looks" all of the built-in qualities it possesses. The heavy shell is of brass, burnished into a glistening golden surface. The solid Steatite Insulator Dome, topped by the brass connection, completes a design of substantial beauty. It is indeed the aristocrat among plugs. Liberty Spark Plugs will sell themselves right out of your show case.*

The Biggest Attraction in Accessories at the New York *and* Chicago Auto Shows

WHEN you entered the Accessory Divisions at either the New York or Chicago Auto Shows and looked for the crowds, you invariably found them at the Stewart-Warner Exhibits.

Why? Because everyone interested in motor cars knew from past experience that it is there you will find the latest and best in accessories. And they were not disappointed this year.

The 1920 line of Stewart Custombilt Necessities contains many new and important accessories, and is the most complete ever offered motorists. Never has a line of accessories achieved such universal popularity, such dominance in the field.

If you are going to buy a new car this year see that it is completely Stewart-equipped. You can accurately judge the value of a car by its equipment. Look for the name Stewart.

If you intend retaining your present car, complete its equipment with Stewart Products. You will thus add to your car's appearance, to its efficiency, its performance and to your own motoring pleasures. Any good dealer will be proud to show you the Stewart Necessities you need. "No car is complete without them."

Super Power

No Valve Grinding

Flexedge

SELF-SEATING

LAMINATED VALVES

Sensible-Logical-Inevitable

A Valve-Seat Carbon Remover at Work While You Drive

5000 Dealers Have Tested Sample Flexedge Valves and Pronounced Them the Answer to the Carbon Problem

Immediately following the announcement of FLEXEDGE VALVES, we were flooded with orders for sample sets for test purposes. As a result, dealers and car owners all over the country have written to us stating that FLEXEDGE VALVES positively eliminate valve grinding and produce exceptional power and efficiency of motor operation. Naturally after our own preliminary testing we expected that a big demand would be forthcoming. Consequentiy we were prepared, and today we are filling orders from dealers in almost every hamlet and metropolis in the Nation.

FLEXEDGE CONSTRUCTION PREVENTS CARBON DEPOSITS

The FLEXEDGE principle is merely a slight flexation, which is so small as to measure only a tiny fraction of a thousandth of an inch, yet sufficient to gently scrape the valve seat, removing the tiny flecks of carbon, which collect after each explosion. FLEXEDGE SELF-SEATING VALVES continuously grind themselves, always seat. They are installed just like all other valves.

Is this

the tire you'd like to handle?

This is the Hand-Built Madison. Tire merchants everywhere have come to recognize the exceptionally high standard of tire endurance set by the Madison. We try to build better tires—not the most tires. We build Madisons by hand, because it is impossible to obtain those extra miles with machinery alone. We build Madisons by hand because we know of no other method which can produce a tire of the same stamina and long life.

Madisons bring superb endurance to the owner and bigger business to the tire merchant. If you have or would like to build up a trade that is not satisfied merely with "a tire"; a trade that knows the wisdom of buying tire endurance,

The Standard Spark Plug of the World

The old, old story of AC dominance was retold at this year's New York and Chicago Automobile Shows. A census taken of the passenger cars and motor trucks on display showed that more fine cars were equipped with AC Spark Plugs than with all other makes combined. The dealer takes no chances in stocking a line that has the endorsement of the leading automotive engineers of the country, or in recommending and selling spark plugs that are used as standard equipment on the leading makes of automotive vehicles. That line is the AC. Concentrate upon it. Write today for complete dealer information.

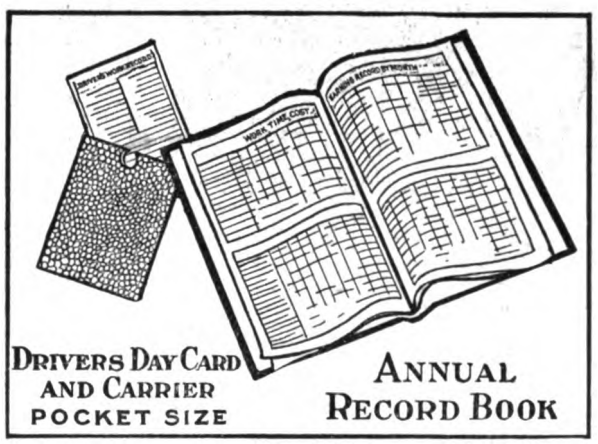
UNIVERSAL MOTOR TRUCK ACCOUNTING SYSTEM



The system includes an annual record book, 350 drivers' day cards, a day card carrier and full instructions.

Any owner can start this system at any time with an old or new truck of any make or type.

Any boy or girl clerk can maintain all records for one or a hundred trucks.

Each system is good for one year, nothing more is needed or necessary.

The records show at a glance any and all items entering into the earnings and cost of operation.

It is extremely simple. 100% complete and full working instructions are supplied with each system.

It is almost self-operating.

A Picture of Business Health

You'll never need a doctor for your business if you have a Marvel No. 5 in your shop. It is always in shape—is spack and span—ready for work. It always does a high-class job and is the greatest little money maker you ever saw. It works faster and does better work at less cost than any machine ever invented and handles any gas engine cylinder from a MOTORCYCLE TO A TRACTOR.

Marvel Cylinder Re-Boring Machine No. 5

In your shop will double your man-power—will turn wasted time into profitable hours—will establish you in the Re-boring business and show a profit on your books.
The Marvel No. 5 is power-driven—automatic—accurate and speedy. It has been endorsed by hundreds of schools and colleges and automotive repairmen.

GET THE PROFIT

There's a lot of extra money floating around in your community and you can get it with a Marvel No. 5. Think of the hundreds of owners of motor cars, trucks and tractors whose cylinders need reboring. Cash in on it. Get in shape to rebore them on a Marvel No. 5 and fit them with Marco Oversize Pistons.

MARCO PISTON SERVICE

WRITE US TODAY

We will outline our entire proposition. We will tell you what a Marvel No. 5 will do for you—Will show you the profit you can expect. We will explain how, through our Co-operative Business Building Advertising, we help bring customers to your shop and how the Marvel No. 5 will hold them.

New York and Chicago Shows Strike the Keynote of Big Business

Twentieth National Displays Feature Practicality and Utility of Motor Car--Representative Exhibits in All Sections

THOSE who are in a position to be well qualified to pass accurate judgment are unanimously of the opinion that never before in the history of the big automobile shows has so large a proportion of those in attendance, both at New York and Chicago, been prospective buyers of cars or equipment. As a rule in the past the number of merely curious spectators has far exceeded actual purchasers, but careful observation this year indicates that these proportions were reversed.

Every year exhibitors have strived to offer at the big shows something that would appeal to every class of spectator who might pass their cars in review. There has been a desire to cater to the practical business man as well as the curious woman, either of which might be a potential purchaser. This was pre-eminently the case this year, although the method of appeal differed from the majority of cases heretofore.

The displays this year were particularly noticeable on account of the absence of freak designs and flashy finish. They were practical business shows and necessarily so, for the real desideratum was a sensible and serviceable car, combining comfort and economy, and the majority of models on exhibtion presented just these characteristics.

If anyone visited this year's show with the idea that he would see many marked changes in the design and construction

Glimpse of First Passenger Car Show Held in Madison Square Garden, New York, in 1900, Giving an Idea of Enormous Development of Industry.

of the 1920 offerings, he was doomed to disappointment. The cars looked very much like those of a year ago and it was only by close examination that the little touches of refinement and minor improvements that would necessarily mark a year's progress in the industry could be noted.

The "post-war" car was predicted by some a year or so ago as one which would show revolutionary tendencies in many important characteristics, whereas what appears to have actually developed is a further and more complete standardization of the best of the old designs—a veritable "survival of the fittest." These changes, many of which, as the designers state, are the outcome of valuable experience gained during the war period, although not especially noticeable to the casual observer, are not the less important. The strengthening of various parts and the simplification of mechanical construction are the principal phases. The main design has been left practically the same as for the past two years with a tendency, however, towards straighter lines from hood to tonneau.

In the matter of finish all car builders seem to have treated the matter from a most conservative standpoint this season as black was the prevailing color for the standard vehicle. The strikingly brilliant hues and startling color combinations of two and three years ago were this year confined almost entirely to special jobs of the sport and racy type. The family car is dark in color, usually black or dark green, and very little trimming of contrasting color is used.

The closed car manifested its rapid development during recent years by easily becoming the leader among the types shown this year. In fact nearly every exhibit that contained more than one model displayed some form of the completely enclosed machine. The sedan was in the majority, but the limousine, landaulet and town car were seen in large numbers.

One of the refinements in the sedan is borrowed from abroad—the glass partition separating the tonneau from the front seats. This division is adjustable and may be dropped out of sight, leaving the standard sedan arrangement.

As the enclosed cars have increased in popularity there has been a change in the style of the upholstery. The leather which is a necessity in open cars to provide a material that will withstand all kinds of weather conditions, has been replaced in many enclosed models by the softer and more refined plush, corded cloth and other materials more in harmony with the elegance of indoor furnishings.

Heaters as Standard Equipment

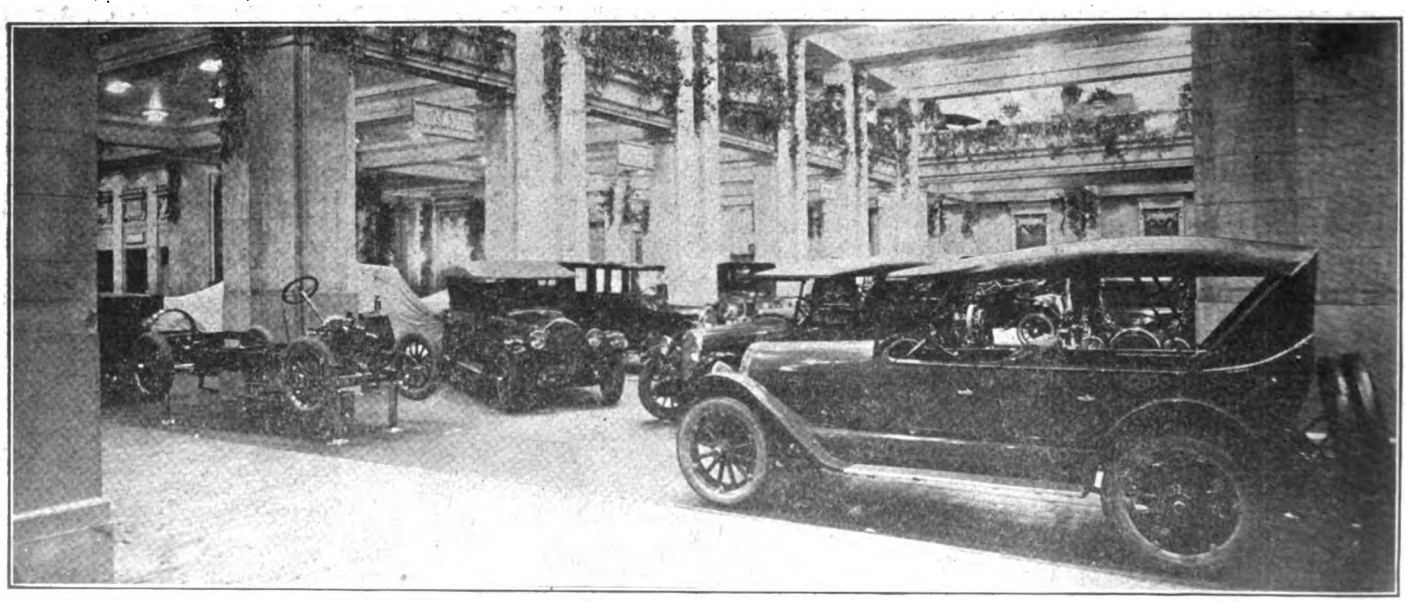
Another development which has logically accompanied the popularity of the completely enclosed car is the introduction of some form of heater as standard equipment, thus perfecting these models for all-year use in any climate. Thirty exhibitors at this show displayed models provided with heaters. This largely exceeds the number of cars so equipped heretofore; in fact, it has hitherto been largely experimental, but the prophecy is now made that some form of heater will soon become standard on all closed cars. It is also significant that this refinement is noted quite as often in the medium priced vehicle as in the more expensive models.

The luxurious equipment of the interior is a noticeable feature. Many of the conveniences and comforts that were formerly included only in the most expensive makes are now added to the standard furnishings of the more moderately priced cars. These included such details as cigar lighters, vanity cases and compartments for cigars and cigarettes, all showing the extent to which designers are catering to the most exacting tastes of a fastidious clientele.

Wire Wheels on the Increase.

While the standard artillery or wood spoke wheels are still in the majority, the wire type was seen on more cars than ever before, and it is obvious that it is gaining in popularity. Disc wheels, which were in vogue last year and 1918 as a war time characteristic, are still found on many of the more luxurious cars.

The requirement in regard to non-glaring headlights now demanded in many states has resulted in the equipment of practically all the new models with some form of lenses that will comply with the regulations. In some cases even the spot



Transverse View of Exhibition Hall, Grand Central Palace, Showing the Setting in

Digitized by Google

light has been supplied with a form of lens that is meant to eliminate the glare without impairing the volume of light.

Mechanical Features Predominate.

It is fast becoming the rule that the owner or prospective buyer of a car who is entirely ignorant of the mechanical make-up of the modern motor car is rare exception, and to meet the desire of such to learn everything possible of the internal economy of the automobile, the manufacturer has used various methods of showing the power plants of his models in actual operation. Many engines were mounted on blocks and cut away to show the interior of the cylinders. Some of these were in motion, being operated by electric motors. Small electric lights illuminated the interior so that all operations could be clearly seen. Other engines were mounted so as to be cranked by hand.

In many cases some exclusive feature of the power plant of a particular car was thus graphically demonstrated.

Decorative Features.

In the novelty and effectiveness of the decorative scheme, Manager Miles again manifested his originality and taste at the Grand Central Palace this year. The imposing features of the entrance were accentuated by the simplicity of treatment, and the visitor was prepared by his first glimpse, through a frame of bay trees and floral masses, for the carrying out of the attractive plan in the interior. Garlands of smilax and greens brought the design into harmony with the spirit of the holiday season, and also suggested the approach of spring. Each display was enclosed by a white railing supported by white posts capped with brown. The big windows that light each of the four floors were curtained with especially designed fabrics. But the "piece de resistance" was embodied in the tapestry panels set at regular intervals along the walls, which depicted fanciful scenes of English country life done in the old English manner. They bore coats of arms and at the top were imprinted the names of the adjacent exhibitors.

General View, Accessories Division, Grand Central Palace, by Which May Be Noted the Comprehensive Character of This Section of the Show.

Attendance Was Large.

In point of attendance it is conservatively estimated to have considerably exceeded previous years, notwithstanding the fact that the admission price had been raised to meet post-war conditions. The exhibition halls were well filled at all times and during the rush hours of the afternoon and evening the public was present in veritable throngs.

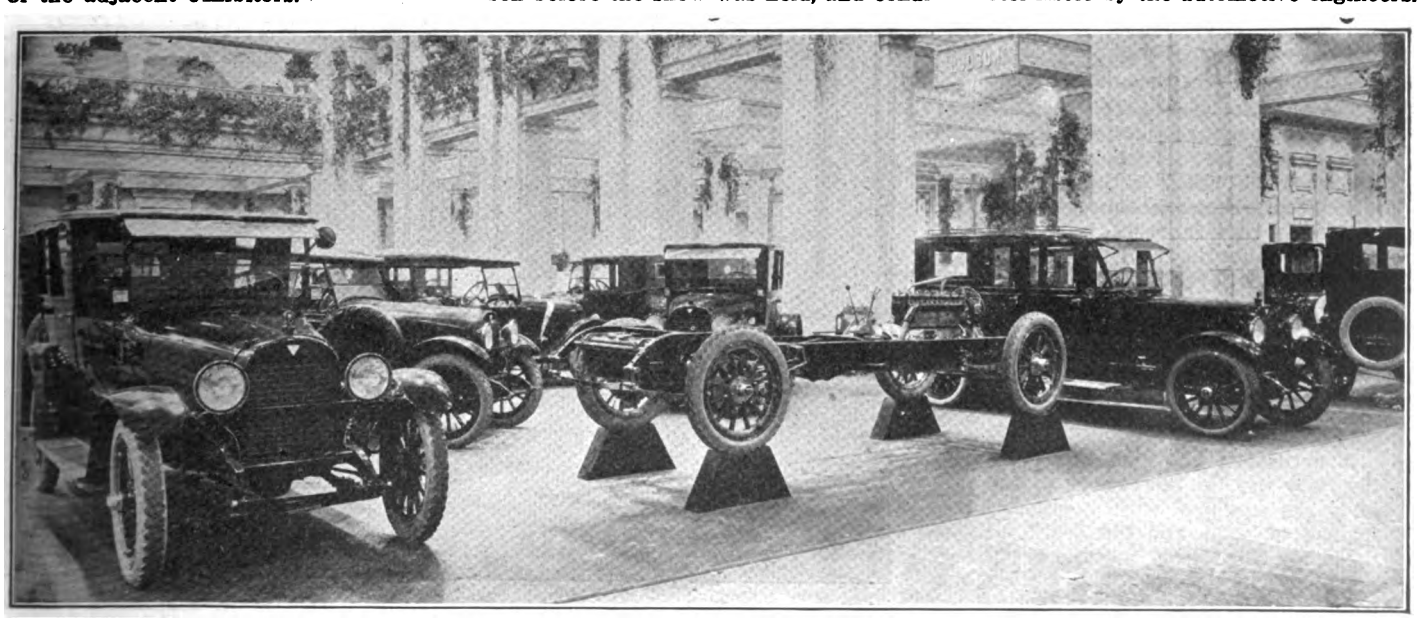
Considered from its business aspects, it was thoroughly demonstrated that the productive capacity of the motor car industry is still very limited when contrasted with the apparently almost limitless absorptive capabilities of the automobile using market in the United States and abroad.

In many instances it appeared that those in attendance came to the exhibition with a clearly defined idea of what would best meet their needs and tastes, and manufacturers' representatiyes were confronted not so much with questions of comparisons of styles and types as by problems of delivery when the order was once booked. It is stated that on account of the unprecedented demand for cars during the opening part of the season before the show was held, and conditions which have materially reduced production, many exhibitors, with the exception of those prepared to produce on a quantity basis, or a few of the new comers whose products are not yet so well known, were somewhat embarrassed when pressed for promises of immediate delivery.

Events During the Week.

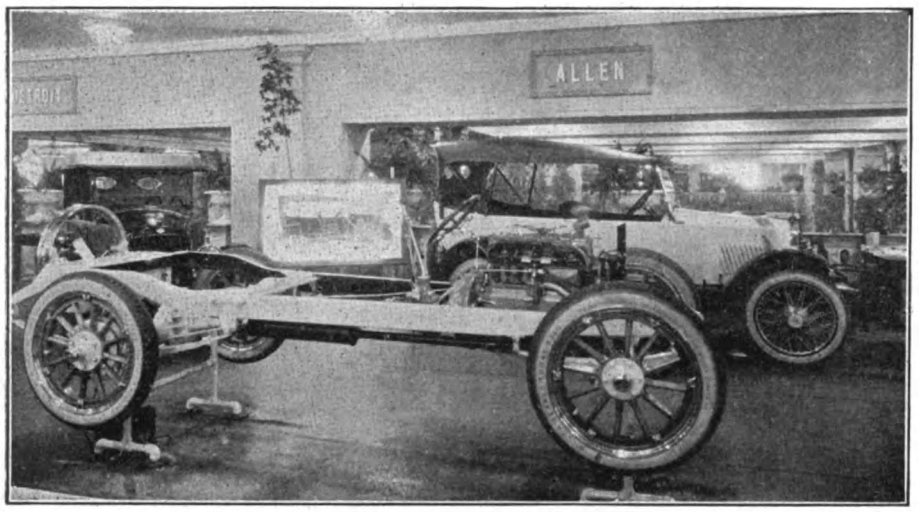
Among the social events of show week participated in by organizations affiliated with automotive interests were the following:

On Monday, Jan. 5, the Rubber association dined at the Waldorf hotel. The annual dinner of the National Automobile Chamber of Commerce was given on Tuesday, Jan. 6, at the Hotel Commodore. On Wednesday, Jan. 7, the National Automobile Show Managers' association had a luncheon and meeting at the headquarters of the Automobile Dealers' association, the professional section of the Society of Automobile Engineers dined at 1 o'clock, the 12th annual banquet of the Motor and Accessory association was held at 7:30 o'clock in the grand ball room of Hotel Commodore, and carnival night was observed at 9 o'clock at Hotel Astor by the automotive engineers.



Harmony with Holiday Season and Including a Number of Representative Car Displays.

Digitized by Google



Showing of Allen Motor Car Co., Columbus, O., Included Latest Model Touring Car and Chassis.

Features of Motor Truck Shows

The overwhelming success of the commercial car section of the show was felt by many to be a remote possibility, when considered in the light of the unfavorable location of the Eighth Coast Artillery Armory for housing an exhibition so far distant from the normal down town show district. There were those, too, who advocated that this class of vehicle should be shown independently of the passenger car section in point of time, while still others maintain that the motor truck and its components are at best doubtful prospects as successful exhibition features.

There is, however, no doubt in all minds that in many respects this show of 1920 was as successful a truck exhibition as could be staged, and this was manifested in many ways. Manufacturers reported that business was transacted in good volume, and it is unquestionably the fact that many of them, if they book no more orders for some time to come, will be fully engaged in filling those already listed for a considerable period.

The foreign demand for the commercial wagon was plentifully in evidence and extremely encouraging.

Exhibits Were Beyond Criticism.

The exhibits were beyond criticism as regarded quantity, quality and effective arrangement, and afforded an epitome of whatever is of utility in this great branch of modern transportation.

As was true in respect to passenger cars, not much in the way of noticeable modifications over previous years was manifested in the machines on view. A development of interest was the advent in considerable numbers of the light truck forms designed and equipped for higher speed than the heavier types.

Increase in Pneumatic Tires.

A noticeable phase of this section of the show was the increase in the number of trucks equipped with pneumatic tires instead of solid, and the desirability of these air filled tires for many types of machines to lessen road shocks was pointed out by many truck and tire manufacturers.

The solid tire is by no means in the discard, however, as a large number of giant cars, equipped with enormous solid rubber shod wheels were in evidence and, of course, the dual form at the rear were common on the heavier vehicles.

Many Parts Were Shown.

Practically every exhibit of a complete truck or tractor was supplemented by a display of parts that came in for its full share of inspection. An unusual number of rear axles was shown with both worm and chain drive. A comprehensive exhibit of engines was also of particular interest to the mechanically inclined.

The collection of statistics that made up an important exhibit showed the cost of transportation by trucks as compared with the horse drawn method. This was studied by many business men who were interested in the tiuck as a means of solving their delivery and shipping problems.

Transportation Congress.

The sessions of the Transportation Congress will be repeated at the Chicago truck show.

Accessories Attracted Much Attention

The allotment of space for the accessories division at both the Grand Central Palace and the Armory, made for a more adequate representation and effective arrangement than ever before. The exhibits devoted to passenger cars at the Palace, as was to be expected, outnumbered the truck section at the Armory, but there were 75 exhibitors making displays devoted exclusively to the commercial wagon at the latter place alone. At the Palace the entire fourth floor was devoted to this department.

No section of the show appeared to attract more attention than this part devoted to accessories. Here thousands of the parts that make up the automobile and its components were on view, as well as the components themselves, and the myriad devices that are designed to add to the convenience and comfort of the motorist, the utility and economy of operation of the car, and to facilitate the care and repair of the automobile in repair shop or garage.

These devices were attractive not alone from their novelty and practicality, but also by the striking mechanical methods of demonstration. This section of the show alone might afford many hours of pleasant and profitable study to those specializing in automotive mechanics and the up-to-date knowledge thus disseminated was more comprehensive and of more utility in many respects than could be gained by a long period of actual repair shop experience; while even the casual non-mechanically trained observer could not fail to be attracted and amazed.

This part of the big building hummed with the whirr of machinery and it seemed as if every component or device that had any movable features might be seen in operation during the hours the exhibition was open. The entire range of up-to-date tools, garage appliances and

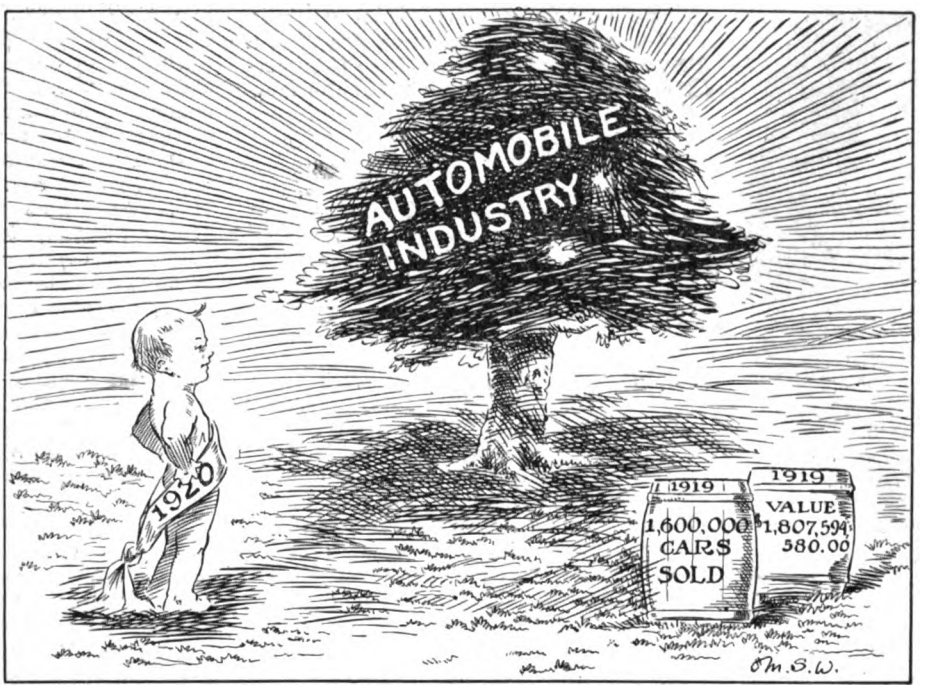
Notes of the Industry and Trade

Prosperity of Past Year Is Demonstrated and Predictions Are Favorable for Busy Season to Come

THAT the past year has been a prosperous one in the automobile industry can be well realized from the statement that the total number of automobiles turned out in this country in 1919 is estimated to have been over 1,600,000, including passenger and commercial cars. This represents a total money value, conservatively figured, of $1,807,594,580, and statement is made by the National Automobile Chamber of Commerce that the automobile industry has gone up to second place in the great activities, becoming second only to the steel industry. It is also predicted that on the same basis of increase at least 2,500,000 new cars will be sold in the United States in 1920.



The Infant Year: "If My Tree Bears as Good a Crop as It Should This Year, It Will Fill Good Deal Bigger Barrels Than Those."

It is estimated that there are now in use in this country over 6,000,000 automobiles. In order to fully appreciate what these figures really mean, it may be stated that the seating capacity of these 6,000,000 cars is not less than 30,000,000 persons. This may be compared with the total seating capacity of the railroad cars of the country, of which there are 55,705, which is about 3,500,000 persons.

To transport the persons now carried by automobiles would require 60,000 new railroad passenger cars ($11,000 each), at a cost of $660,000,000; 12,972 new locomotives ($35,000 each), at a cost of $524,000,000, and duplication of passenger tracks, stations and employees at an expense very difficult to calculate.

If every motor car now in use in the United States traveled 3000 miles a year, a low average, and carried three passengers each mile covered, the total passenger mileage would be approximately 45,000,000,000.

The disappearance of the automobile would make it necessary to increase the horse population by about 25,000,000. It requires the produce of five acres of well farmed land to feed a horse for one year. This would mean that 125,000,000 acres more, heavily cropped, would be necessary to care for the additional live stock. There are now about 25,000,000 horses in the country.

It may also be stated in this connection that the latest reports indicate that nine tenths of all the motor cars in the world were built in the United States. In first nine months of the past year the United States shipped to foreign countries cars exceeding $75,000,000 in value, at which rate the total value of exports for the year should be above $100,000,000, or an increase of nearly 60 per cent. over last year.

NEW LOCKPORT GEAR CO.

The recently incorporated Dittmer Gear & Manufacturing Co. has commenced razing the old buildings on the Mansfield Glass Co.'s site at Lockport, N. Y., which was purchased by A. H. Dittmer, president of the company, to make room for an up-to-date plant to be constructed of steel, brick and concrete.

The property purchased has a frontage of 264 feet on Grand street and a similar amount on Green street, and has a depth of 252 feet from Grand to Green street. The unit to be built will have a floor space of 22,000 feet.

The Dittmer Gear & Manufacturing Co. is capitalized at $175,000. A cooperative plan with its employees will be put into operation from the outset, as all will be encouraged to become stockholders in the concern.

President Dittmer has associated with him men of practical experience in the lines to be manufactured by the company, among them being W. J. Riley of Lockport, who resigned a position as buyer of machinery, tools, etc., with the Covert Gear Co. to accept the office of efficiency engineer with Dittmer company.

NEW FOUNDRY FOR BURD RING CO.

The new foundry recently completed by the Burd High Compression Ring Co. at Rockford, Ill., maker of Burd high compression and quick seating piston rings, will more than triple the production capacity of the plant.

Burd piston rings are individually cast from a tough gray iron of special analysis, filtered so that all impurities are removed, to insure absolute uniformity of metal texture, greater strength, prompt and perfect seating and freedom from flaws, porous spots and other defects.

The progressive systems and improved processes of making piston ring castings installed have also aided in attaining the desired increased output.

COLUMBIA MOTORS EXPANDS.

The Columbia Motors Co., Detroit, is to increase its production facilities by the immediate occupancy of the plant formerly occupied by the B. F. Everitt Co. at the junction of Mack avenue and the Michigan Central railroad, which it recently acquired. The new buildings are conveniently located only a few blocks away from the present factory, and will provide adequate facilities, pending the erection of the new factory on Fort street, work on which was delayed by the building and fuel conditions.

PURITAN CO. REMOVES.

The Puritan Machine Co., Lafayette building, at 10th street, Detroit, Mich., has purchased the property at the corner of Fort and Eighth streets, now occupied by the All Power Truck Co., and will at once move its manufacturing department to the new location.

Digitized by Google

Saxon Reorganization Is Ratified

Stockholders of the Saxon Motor Car Corporation, Detroit, unanimously indorsed the reorganization plans of the company as outlined by C. A. Pfeffer, secretary and treasurer of the corporation. This plan provides the concern with a working capital of between $2,500,000 and $3,000,000. Expansion policies will be carried out.

C. A. Pfeffer, Secretary-Treasurer Saxon Motor Car Corporation.

The Saxon Motor Car Corporation is now reorganized under the laws of New York, creating a new stock issue of 200,000 shares of no par stock, 60,000 shares of which is exchanged share for share with the present stockholders, and 120,000 shares will be marketed through an underwriting syndicate. The remaining 20,000 shares will be reserved for general corporate uses.

This new plan will put the company on a solid financial footing.

THE NEW ENGLAND MILLS SEEKS LARGER QUARTERS.

The New England Mills Co., Chicago, announces a change in location which has been made necessary by a rapidly increasing business, and a desire to secure the convenience of having show rooms, offices and warehouses combined at one place. The former show rooms and offices, at 1219-1221 South Michigan avenue, have been abandoned and the sales and accounting departments will in the future be at the warehouse at 1027-1033 West Van Buren street.

The New England Mills Co. is a well known manufacturer, jobber and distributor of automobile and truck accessories, robes, blankets and leather goods. The officers are: President and treasurer, Ed. C. McCoy; vice president, Frank J. Enright; secretary, Richard A. Linehan. Among the products for which it is the exclusive distributor are the Empire, Fidelity and Nemco brands.

COTTA TRANSMISSION CO. EXPANDS.

The Cotta Transmission Co., Rockford, Ill., is making plans for increasing production and improving sales arrangements for the new year. D. W. Bay, formerly sales engineer of the Motor Bearings division of the Hyatt Roller Bearing Co., has been appointed sales manager of the Cotta organization, and F. W. Ramey, who returned from overseas to take up duties on the Cotta staff, is Mr. Bay's assistant. W. J. McLaughlin, formerly of the Continental Motors Corporation, is in charge of production.

The building of transmission for truck and tractor service has been placed on a large quantity basis by means of the progressive system of assembly in the modern daylight factory located in the new manufacturing district of Rockford.

In the past year the Cotta company, switching from a production that was 90 per cent. for war purposes, has brought its commercial sales and production up past the high point of war work without any government business now being included in its volume.

NORMA CO. INCREASES PRODUCTION.

On Dec. 10 the Norma Co. of America, manufacturer of Norma Precision bearings, moved its factory from the Bronx, New York City, to Anable avenue, Long Island City, N. Y., where a modern four-story reinforced concrete building has been acquired.

This will give largely increased factory facilities, making possible the augmented output of Norma bearings necessitated by the growing demand for these high-precision units. The new plant is being rapidly equipped with special machines and the full capacity will be available shortly.

The executive offices at 1790 Broadway have been consolidated with the factory at the new address.

DUPONT INCREASES CAPITAL.

The DuPont Motors Manufacturing Corporation, Wilmington, Del., has increased its capital from $100,000 to $200,000.

Van Derhoof Forms Bacon Motors

Frederick C. Van Derhoof, who recently resigned as general manager of the automobile department of the Standard Steel Car Co. of Pittsburgh, after being associated with that concern since the organization of its automobile department eight years ago, announces the formation of the Bacon Motors Corporation at New Castle, Pa., of which he has been elected president. This new concern will build a light six, moderately priced car, which will be ready for market early in the spring.

The Bacon Corporation has purchased, at New Castle, a 21-acre factory site, including a new automobile factory, 500 feet long by 100 feet wide, of thoroughly modern construction, capable of producing 50 cars a day. It is capitalized at $1,500,000, which it plans to increase shortly to $2,500,000, and starts business without a dollar of indebtedness. The erection of a three-story building 50 by 600 feet is also projected for a body factory, upholstery and painting department adjacent to the present plant. The ground site has a frontage of 687 feet on Butler avenue, a main thoroughfare of the city, and extends 1461 feet along the tracks of the Allegheny Western railroad, from which spur tracks extend into the plot.

Mr. Van Derhoof has associated with him the following officials, all men of large business experience in Pittsburgh and vicinity: Vice president, F. W. Bacon, New Castle; secretary and treasurer, George N. Glass of Pittsburgh; additional directors, D. W. McNaugher, C. D. Scully, W. E. Provost and Edwin N. Ohl, all of Pittsburgh; assistant secretary-treasurer, E. C. Hopkins, New Castle; sales manager, H. L. Archey, Philadelphia. The engineering department is in charge of Erling Oyen, who resigned from the same department of the Standard Steel Co.

The Little Motor Kar Co., Dallas, Tex., has closed a deal for a large plot of land at Havre de Grace, Md., and will start in the early spring on the erection of the first unit of an eastern plant, to be of concrete and steel, 100 by 500 feet.

Modern Factory Recently Purchased by Bacon Motors Corporation at Newcastle, Pa.

Records That Master Details for the Dealer

By Walter Engard.

AFTER he has footed up his annual inventory sheets, the average garageman and auto dealer feels that after all has been said and done the information which the annual inventory affords him is entirely too indefinite. Ninety-nine times out of a hundred the actual net returns from the business fall far short of what he had expected to make and to which he is justly entitled in view of the amount of business he had done through the year just closed. He takes his pencil and tries to figure out why it is that he had not made more money, but there is nothing in his inventory that will tell him or enable him to figure out where his profits have gone. The inventory sheet doesn't show the dealer where his leaks may be, or what he might do to better the situation.

The business man wants facts. He deals in facts and when he operates his business in the realm of surmise and fiction the results are apt to be disastrous. No dealer can hope to operate his business during these days of keen competition, rising costs and narrower margins of profit with even a moderate degree of success unless he is in position to know every important fact and figure regarding his business, not at the close of the year as some dealers do, but at the close of every business day, week and month.

There is no one factor that is so imperative to the successful management of a garage and accessory business as is that of accurate records. The dealer who must wait until the annual inventory is taken in order to determine whether or not his business is making money, whether or not every department of his business has been conducted successfully throughout the year, and whether or not there has been some leak in the business that has caused the profits to shrink, is taking a mighty big chance.

Records should be to the garageman and auto dealer what a thermometer is to a physician, or a carburetor to the automobile—in other words, indispensable. Records are absolutely necessary at all times to the life of the business. They enable the dealer to keep a tab upon the temperature of the business and to know at any time whether or not the business is being conducted profitably. They further show him what each department of his business is doing, whether or not each department is being carried on successfully, whether or not there is some place in his business that needs quick action and prompt attention in order to apply a remedy to cure defects shown by his records. Such records afford the dealer an accurate means for correcting errors or extravagances in policies and methods, for checking the accumulation of otherwise inevitable losses and for quickly developing plans which will result profitably.

It is necessary for the dealer who wishes to secure the information necessary for the efficient control of his business, to install a proper system of records. The best system of records for any business is one that will give the dealer all the information necessary for the efficient management of his business with the least effort. This system should be simple, easy to operate and at the same time complete and accurate. It should be convenient and economical. Such a system cannot be of such character that the cost of maintenance will be excessive, yet it must be complete or a very large part of its value is lost.

There is published here just such a system of records. It provides for a complete summary of the daily transactions. Only a few entries are required each day, yet it is complete and will at all times be a mirror of the business. It will show every day and any day every important fact regarding the business. This system is composed of:

(1) a sales ticket. (2) a repair order. (3) a labor ticket. (4) a time ticket, (5) a daily record of sales. (6) a daily record of expenses.

Before going into details regarding this system of records and its working, I wish to emphasize this one fact: That success will result only if the necessary care is given to getting it started right and keeping it going. Records can be made practically automatic, but they are bound to require some intelligent supervision, and they are not worth the paper upon which they are written unless you make them a practical guide for the future control of your business.

You will note that this system of records provides for keeping the sales in each department of the business separately; therefore, the very first thing to do in adopting it is to departmentize your stock. In order to operate any business at the very highest point of efficiency it is necessary that the dealer be in a position to determine that each small part of his business is being operated successfully. One small part of the business, creating friction, may cause the entire business to come to a standstill; that is, a leak, a loss, a waste, somewhere in the business, may cause the entire business to be operated at a loss. But if the dealer has his business thoroughly departmentized he will be

able to lay his finger upon that department which perhaps caused the loss in plenty of time to apply a remedy and thus save the entire business from failure. The garage man and auto dealer cannot hope to operate his business at the highest point of profit to himself unless he has each department of that business running successfully, and in order to do this he must have his business departmentized. The following departmental classification is suggested, although it can be changed to suit requirements, depending upon the size of the plant and the various kinds of merchandise handled:

(1) automobiles, (2) tractors, (3) trucks, (4) accessories, (5) tires and tubes, (6) oil and gasoline, (7) repairs.

Of course there are some garages that may need an entirely different classification, but the point to bear in mind is the necessity of departmentizing your business in order to handle it better, and by so doing you will be able to know just what each department is doing.

Your next step is that of marking every article in stock. For this purpose you should provide price tickets upon which you may enter the cost mark and the selling price. Price tickets in the form of shipping tags may be used on all such articles as automobiles, trucks, tractors, tires, repair parts, etc., while price tickets in the form of stickers may be used on small items such as tubes, cans of various articles and package goods of all kinds. This is very important in connection with this system of records as will be shown a little later in this article. No article should be allowed to go into stock until it has first been marked with the cost mark and the selling price.

All accessories, tires, tubes and repair parts should be kept in the accessory department.

As soon as you have completed this operation, that of marking the stock, the system is ready for operation. In presenting this system, and for that matter any system, it is necessary that you thoroughly understand that you must adopt the use of sales tickets for making a record of every transaction. This is very important if your records are to be accurate and unless they are accurate they will be of but little value to you.

A sales ticket should be made out by the salesman for every sale whether for cash or credit, entering the date, to whom sold, the department from which the article is sold, the quantity, the name of the article, the cost mark and the price received.

As these records provide for keeping a separate record of the sales in each department, and the sales ticket provides for the entry of the name of the department from which the article or articles was sold, it will be necessary for the salesman to make out a separate sales ticket for articles sold from the various departments; that is, should a salesman sell a customer a new machine, an extra tire and tube and a spotlight, he will make out three separate sales tickets, one for the machine from the automobile department, another for the tire and tube from the tire department and a third one for the spot light from the accessory department. This will facilitate the work of the bookkeeper in keeping the sales of each department separately and will not cause the salesman any great inconvenience.

In the case of supplies and repair parts used in the repair department, the foreman of the repair department should make out a requisition order for such supplies and repair parts as are needed by the workmen in the repair of the cars. This requisition order should designate to whom the supplies and repair parts are to be charged. When this requisition order is delivered to the stock keeper, who is in charge of the accessory department, he will deliver to the workman such supplies and repair parts as are designated and then will make out a sales ticket charging the customer with such supplies and repair parts as are used on his car. The requisition order should be pinned to the sales ticket and turned into the bookkeeper along with the sales ticket. This gives the stock keeper protection should the owner of the car dispute the purchase of any supply or repair part, for by producing the requisition order the owner will see that it was used in the repair of his car and it will also show which workman secured the supply or repair part.

These sales tickets should go immediately to the bookkeeper, also the cash received if the article was paid for. The bookkeeper should have a blank piece of paper on her desk so ruled as to keep the record of sales in each department separately, having two columns for each department, and as these sales tickets come to her she should enter the amount on the sale under the correct department, also the cost of the articles sold, keeping the costs in one column and the sales in another.

At the close of the day the bookkeeper will total these columns, thus securing the amount of sales in each department and also the cost of all goods sold in each department. She will then turn to the "Daily Record of Sales," form of this system, and enter the figures as provided on this form. Under the heading "Total Sales" she will enter the total amount of all sales in all departments, showing the volume of business for the entire day, also the total cost of all the goods sold.

At the close of the month the bookkeeper will total each column, for it will be noticed that this form provides for the sales records for one month; that is, a new form must be used for each new month, and on the extreme left hand side a column has been provided for entering the date upon which the figures are entered. By totaling each column you have the total sales for each department, also the cost of all the goods sold in that department during the month. Subtracting the cost of the goods sold from the amount of the sales you have the amount

of gross profit made in each department. This form enables you to keep an eye upon the progress of each department. From it you may determine which department is forging ahead the fastest and which will need a little pushing.

In the repair department you will provide a "Repair Order" such as illustrated herewith. When a car is received for repairs the foreman of the repair department will make out a "repair order," entering the name of the customer and his address, the date, the make of car, the license number, the job number and instructions as to what is to be done to the car. This repair order should be made out in duplicate, one for the foreman and one for the workman.

You will also provide a "Time Ticket" such as illustrated on preceding page. Of course in using a time ticket it is not absolutely necessary to have a time clock, but every garageman will find a time clock a very valuable fixture of his equipment. When a workman starts in on a repair job he will take the repair order and note the instructions; then he will take a time ticket and enter the job number, the date, the name of the workman, the kind of labor he does and the time he begins on the job. As soon as he quits the job he will enter the time he quits. It doesn't matter how many men may be working on this job the time ticket provides space for the record of each man, showing the length of time he puts in on it and the kind of work he does. There is only one time ticket for each job, thus facilitating the work of figuring the hours that are to be charged to that particular job.

All time tickets should be turned into the foreman of the department at the close of each day and as soon as all tickets are turned in he will make out a "Labor Ticket," as shown, entering the name and address of the customer, the date and make of car; also the number of hours each workman spent on this job, the kind of work each did, the rate per hour to be charged and the total amount of the labor charge. These labor tickets will go into the office each evening whether the job is completed or not, a new ticket being made out the next day if the job isn't completed.

The total amount of all labor charge as shown by the labor tickets for the day will be entered on the "Daily Record of

DAILY RECORD OF EXPENSES

Date_____ 19___

	Date	Item	Am't	Distribution to Departments						
				Auto	Tractor	Truck	Access.	Tires-Tubes	Oil-Gas.	Repair
Percent. Ratio to Sales			%	%	%	%	%	%	%	%

Sales" form to the credit of the "Repair Department" as provided on this form. You will note that this form does not provide for the entry of any costs under this department. All costs in this department are expenses and are charged direct to the expense account, and all material used in the repair department is charged through some other department as sales.

Now the "Daily Record of Expense" form provides for an accurate record of all expenses and every cent paid out for operating should be charged on this form, entering the date, the items and the total amount, and then it should be distributed to the various departments according to their participation in it. For instance, all salaries will be charged in one item and then each department should be charged with its share of that expense. Rent should be also charged to the various departments according to the space they occupy. Office expense will be proportioned to the various departments according to the volume of sales in each department. The same is true of such items as heat, light, insurance, taxes, manager's salary, advertising, etc. Of course any items used exclusively by any one department will be charged directly to it and not proportioned to any other departments, such as waste used in the repair department; an advertisement advertising accessories will be charged to the accessory department, etc. At the close of the month each column should be totaled and here you have the cost of operating each department of the business. At the bottom of this form you will note that space has been provided for entering the percentage ratio the expenses bear to the sales, thus showing the dealer whether his percentage of mark-on has been sufficient to cover his cost of operating and to leave him a fair margin of profit.

Good management is not a matter of guess work. The dealer or garage man does not use good judgment when he guesses. There is but one right way to handle a system of records properly.

With this system the dealer knows at the close of each month which departments have made money and exactly how much. The "Daily Record of Sales" shows him the amount of gross profit and by deducting the cost of operating that department as shown by the daily record of expenses he has the exact net profit made from that department. He doesn't need to guess at one single important fact in his business. He does not guess whether or not his repair department is self-maintaining; his records show him whether or not it is. His daily record of sales shows him how much was taken in by this department during the month and the expense record shows him how much it cost him to operate it. This system of records eliminates the necessity of guess work, develops the weak spots and enables the dealer to know just where his profits are going, and he has every important fact and figure right at his finger tip at any time.

Portage Rubber Co. to Build New Unit

DIXIE RUBBER CO. INCORPORATED TO MANUFACTURE IN SOUTH.

John T. Johnson, works manager of the Portage Rubber Co., Akron, O., is working out production plans that entail the construction of a large additional unit at the factory at Barberton, O., to comprise a header building with three wings, each of which will be 60 by 200 feet and several stories in height. This new unit will be devoted almost exclusively to the production of cord tires.

Mr. Johnson, who is a graduate of the mechanical engineering college of Cornell university, was for many years with the B. F. Goodrich Co. at Akron. Starting in the cord tire department he soon became manager of that branch and later was placed in charge of the tire experimental department. For a short time he was works manager of the Cord Tire Corporation at Chester, W. Va., leaving that position to go to the Portage company.

The Dixie Rubber Co. has been incorporated at Memphis, Tenn., and will build a plant in that city for the manufacture of automobile inner tubes and casings and by-products which will utilize the waste material resulting from the making of the accessories mentioned. This is said to be the only establishment of the kind in the South. The list of officials is as follows: Vice president and general manager, L. C. Cadenhead, Mahned, Miss.; vice president and assistant general manager, Thomas Kirk, Memphis, Tenn.; secretary and treasurer, T. J. Gresham, Indianola, Miss.; directors, C. N. Elliott, Memphis; J. M. Clower and J. W. Peyton, Dwyer, Miss.; E. N. Case, Sunflower, Miss.; M. H. Henry, Hickory Flat, Miss.; M. Gerstel, Memphis; G. W. Currie, Hattiesburg, Miss.; Ike Mendel, Memphis; H. B. Bixler, Akron, O.; Julius Thompson, Percy, Miss.; E. V. Catoe, Webb, Miss., and Theodore Read, Memphis. The office of president is not yet filled.

The Ray Tire & Rubber Co., Chicago, represented at Birmingham, Ala., by Thomas Z. Tyler, plans to build in the southern city a factory with a daily output of 25,000 interliners for puncture proofing automobile tires. The product will be of cotton and the machinery will include equipment for manufacturing as well as rubberizing cotton fabric. Buildings and machinery will cost $250,000.

John T. Johnson, Works Manager, Portage Rubber Co., Akron, O.

The Fort Wayne Tire & Rubber Manufacturing Co., Fort Wayne, Ind., has announced the appointment of B. E. Lorentz of Jeannette, Pa., as general factory superintendent. Mr. Lorentz has been associated with the Pennsylvania Tire & Rubber Co. of Jeannette for a number of years, resigning the position of production superintendent to go to Fort Wayne.

The Stanwood Rubber Co., Elizabeth, N. J., announces that it has secured the services of George Culp as general sales manager. Mr. Culp was for some years associated with the United States Tire Co., joining that concern soon after its organization. The Stanwood Co. recently acquired the controlling interest in the Hardman Rubber Corporation, Belleville, N. J., which concern is, however, continuing the marketing of its own brands of tires and tubes. The Stanwood company is erecting a factory at Elizabeth capable of turning out 1000 Stanwood cord tires a day, which will be in production about the middle of January.

The Ardmore-Akron Tire & Rubber Co. has its new factory nearly completed and expects by the first of the year to be turning out 500 tires and tubes a day.

Firestone Co. Holds Annual Meeting

BIG VOLUME OF BUSINESS REPORTED AND EXTENSIVE PLANS FOR 1920.

At the annual meeting of the Firestone Tire & Rubber Co., Akron, O., held Dec. 15, it was announced that Firestone sales are now being made at the rate of $150,000,000 a year, and this is the goal set for 1920. Reports submitted showed that the sales for the fiscal year ending Oct. 31 were $91,078,513.70. This is an increase of 20 per cent., or $15,277,006.91 over the previous year. It was also announced that the company will pay an extra dividend of $2 a share to stockholders of record Dec. 15, and that the directors looked forward to being able to put each quarterly dividend on that basis.

Profits for the year, after allowances for depreciation and losses on bad accounts, were reported to be $9,306,978.19. From this amount $2,597,787.30 was paid during the year in dividends, and the balance was placed to surplus, subject to corporation income and profits tax accrued.

The directorate elected by the stockholders is made up as follows: H. S. Firestone, A. C. Miller, L. E. Sisler, S. G. Carkhuff, J. C. Robertson, J. W. Thomas, Harvey S. Firestone, Jr., A. G. Partridge, C. A. Meyers, T. Clemens. The directors re-elected the following officers: President, H. S. Firestone; vice president and general counsel, A. C. Miller; secretary, S. G. Carkhuff; treasurer, J. G. Robertson. Three new vice presidencies were also created, as follows: In charge of sales, A. G. Partridge; in charge of manufacturing, J. W. Thomas; in charge of offices and purchases, Thomas Clements.

The company issued in connection with its annual report a particularly attractive booklet under the title "Things That Interest Firestone Shareholders," which contains information of value to all interested in the activities of the company.

The Virginian Rubber Co., recently organized at Charleston, W. Va., will spend $225,000 for the initial unit of its plant, to have a daily capacity of 1000 tubes and 500 tires of cord and fabric construction.

SHILTS ASSISTANT SECRETARY WITH GOODYEAR.

The Goodyear Tire & Rubber Co., Akron, O., has promoted W. D. Shilts, who has been with the organization for 14

W. D. Shilts, Assistant Secretary, Goodyear Tire & Rubber Co.

years, to be assistant secretary of the company. On being graduated from Mt. Union college Mr. Shilts came to Akron as personal secretary for the manager of the automobile tire department. He had planned while in college to make the law his profession, but realizing, after two years of association with Goodyear, that his opportunities with an organization of that scope might be practically unlimited, he decided to remain in the tire business. From that time his rise was rapid. He was soon made assistant to G. M. Stadelman and chosen as head of the automobile tire department, then manager of the salesman's department. His broad vision, coupled with exceptional executive ability, quickly brought further recognition and he was made chairman of the Board of Control.

His recent appointment as assistant secretary is the latest tribute to his efficient service with the Goodyear organization and he will continue to act as chairman of the Board of Control.

VICTOR RUBBER STOCK.

The authorized issue of the common stock of the Victor Rubber Co., Springfield, O., consists of 50,000 shares, 35,000 of which are being offered at this time, the balance remaining in the treasury of the company. There were recently sold by brokers in Cleveland, O., within a short time 9900 shares offered and the allotment is said to have been three times over-subscribed.

Of the present issue a liberal amount is reserved for old stockholders and employees, and the balance was offered to the public at $35 a share. By 11 o'clock of the day the stock went on the market there was not a share on sale at the offering price. Chicago brokers offered $37, but could not be accommodated.

FIRESTONE CO.'S NEW MECHANICAL BUILDING.

The Firestone Tire & Rubber Co., Akron, O., has under construction a mechanical building on a site near Plant No. 2 at Akron. It will be three stories high and is designed to house the electrical, machine, pipe, carpenter, pattern and tin ships, and will coordinate under one roof all the activities in these departments which has been distributed through the various buildings of the big plant.

With a frontage of 325 feet on Main street the building will have a depth of 315 feet. Approximately 80 per cent. of the wall space will be glass, thus giving fine lighting advantages. The floor will be of wooden blocks laid on reinforced concrete. The cost of construction will be about $400,000.

The total floor area of 303,457 square feet is divided as follows:

Unloading tracks and platform, 14,860; steel storage, including aisles, 34,556; manufacturing, S. A. E. department, 29,650; pneumatic rims and accessories, 39,470; plating, 9825; galvanizing, 9825; inspection, 9825; S. A. E. storage, including aisles, 35,685; pneumatic rims and accessories, including aisles, 53,370; packing, shipping and receiving, 176,660; shipping tracks and platform, 7000; trucking space, 2000; mechanical departments, machine shop, 6000; electrical shop, 1800; pipe shop, 3000; carpenter shop, 3000; stock room and aisles, 3000; office and entrance, 12,925. Total main building, 293,457. Boiler house, 10,000.

THIRD PLANT AT JACKSON.

The Ajax Rubber Co., Inc., with factories at Trenton, N. J., and offices at New York, has decided to build its third large plant at Jackson, Mich. The estimated cost is $750,000, and it will employ a force of 1500 workmen, with a daily output of 2500 automobile tire casings.

TIRE DEALER'S IMPROVEMENTS.

The Crabtree-Hardin Tire Co., 10th and Garrison streets, Fort Smith, Ark., which is the distributor in that section of Hood and Goodrich tires, has enlarged and made extensive improvements at its headquarters.

United States Rubber's Training Plan.

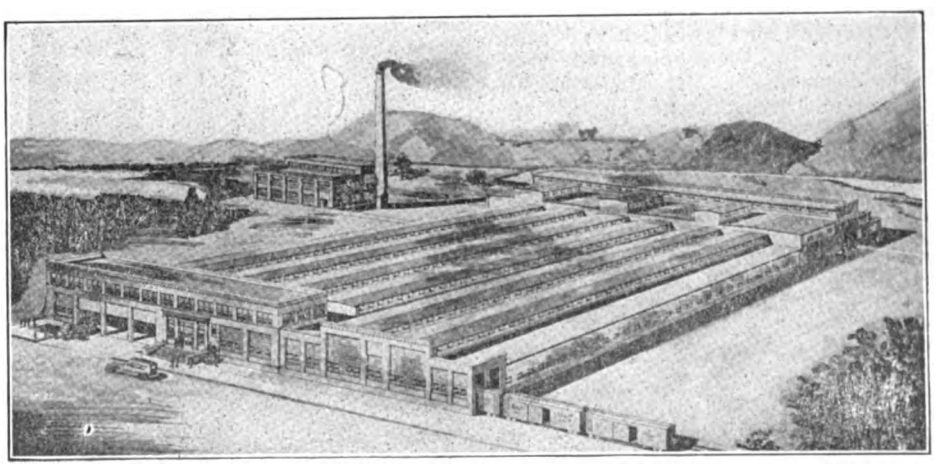
The tire division of the United States Rubber Co. has just inaugurated at its plants at Hartford, Conn.; Detroit, Mich., and Indianapolis, Ind., a plan of training its foremen and other members of the supervisory force, which is of considerable interest. Classes at these three plants, totaling 825 men, have been formed to pursue a course in modern production methods, which comprises the study of specially prepared textual material, the solution of practical factory problems and pertinent discussions. Six meetings are to be held at the plants at three-week intervals. At each meeting a lecture will be delivered by an experienced production man to be followed by a round table discussion. Included in the group, besides the foremen, are the chief plant executives, which insures that the policies of the company will be correctly interpreted. The subjects covered are as follows:

"How to Promote Team Work in the Shop," "Handling Workers by Methods That Make for Harmony and Efficiency," "Improved Methods of Factory Organization," "Handling Materials and Equipment Productively," "Reducing Costs and Stopping Leaks," "Modern Ideas of Management."

The course is conducted under the direction of the Business Training Corporation of New York.

ERIE TIRE COMPANY TO BUILD.

It is reported that J. Frederick Seiberling, who recently resigned the vice presidency of the New Castle Tire & Rubber Co., is to be general manager of the reorganized Erie Tire & Rubber Co., Erie, Pa., and that A. G. Seiberling, general manager and vice president of the Haynes Automobile Co., will be associated with him. It is also stated that plans are under way for the construction of a factory group with a capacity of 1000 tires a day and that tubes will also be made, the entire output of the plant for the next two years being contracted for in advance.



New Mechanical Building, Firestone Tire & Rubber Co., Akron, O.

Upper Cut-Away Portion Shows Sturges Cord Tire Sole.

Lower Shows Tire Over Which Sole Is Applied.

RUBBER SHIPMENT VALUED AT $1,500,000.

What is declared to be the biggest shipment of crude rubber ever consigned to an American company was recently received at Akron, O. It consisted of 3,000,000 pounds and is valued at $1,500,000. It has been on the road four months, coming from Sumatra, and will furnish material for 350,000 average tires.

SWINEHART ENDURANCE TESTS.

Thornton Roberts, manager of the Colonial Garage & Repair Co., Baltimore, Md., local distributor of Swinehart tires, made by the Swinehart Tire & Rubber Co., Akron, O., recently made an endurance test of a set of these tires on a 1½-ton Packard truck and they ran 45,512 miles.

The Keystone Tire & Rubber Co., New York City, has recently secured what is thought to be the largest tire order for export given to any American company since the war. This amounts to $3,000,000 for tires to be used on taxicabs throughout France. Yves de Villers of this company has just returned from abroad and brought an order for $500,000 worth of tires to go to London.

The J. & D. Tire Co., Charlotte, N. C., has changed its name to McClaren Rubber Co. and will manufacture McClaren tires under the direct supervision of H. L. McClaren, former president and general manager of the Racine and Ajax Rubber companies. Mr. McClaren is president and treasurer of the McClaren Co.

The Goodyear Tire & Rubber Co., Akron, O., has found the demand for the booklet, "The Story of the Tire," from schools and colleges so widespread that it was necessary to issue a second edition, which is just off the press. It is claimed that 8000 institutions of learning, from coast to coast, are using it as a reference work and text book.

The Star Rubber Co., Akron, O., will distribute Star tires at Waco, Tex., through the Texas Motor Supply Co., which is under the managemnt of J. G. Hudson.

FEATURES OF STURGES CORD TIRE SOLE.

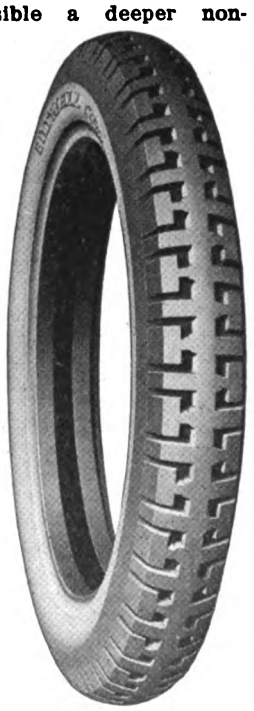
V. K. Sturges, president of the Sturges Tire & Rubber Co., Oakland, Cal., the original inventor of the tire sole idea which is covered by United States patents, has recently perfected a new Sturges cord tire sole which embodies new and improved features. Having in mind the increasing popularity and proved efficiency of cord tires, Mr. Sturges, after exhaustive experiment, is convinced that he has produced a cord tire sole which is well adapted for use with tires embodying the cord principle. These soles are scientifically constructed from new, live, resilient rubber and standard weave cord tire fabric.

Mr. Sturges believes that a tire properly cured cannot stand the additional cure or cooking made necessary in the process of retreading, and that double curing damages the fabric, causing the rubber to become hard and brittle, through oxidation. The Sturges cord tire sole is claimed to be in no sense a retread or a makeshift.

In applying the Sturges cord tire sole the worn casing is properly prepared by buffing off the rubber projections until the surface is smooth. The sole is placed entirely over it and held thereto by a specially prepared cold cure, self-vulcanizing cement, which causes the sole to become an integral part of the tire. It is held to the rim by inflation, the same as the tire. The Sturges cord tire sole fits over all sizes of cord tires and is marketed with "no limit mileage" guarantee.

BILTWELL CORD TIRE.

An unusual cord tire, guaranteed for 10,000 miles, has just been placed on the market by the Biltwell Tire & Rubber Co., Akron, O. Its most striking characteristic is stated to be its square-shouldered tread, which conveys an impression of extraordinary thickness, presents a large area of traction surface, and makes possible a deeper non-skid pattern and prolongs this quality of the tire for several thousand additional miles, it is claimed.



The Biltwell company, while one of the youngest tire makers in the Akron district, is reported to have made great strides in production during the past few months, and is installing equipment which will double the output within the next three or four months. The present factory is one of what will ultimately be four similar units.

V. K. Sturges, President, Sturges Tire & Rubber Co., Oakland, Cal.

BIG FOREIGN MARKET FOR AMERICAN TIRES.

"American industry will be forced to extend itself to the utmost during the next few years to supply its foreign trade if the present export demand for automobile tires may be taken as an indication," said H. A. Githens, general sales manager of the Federal Rubber Co., Cudahy, Wis., at the New York automobile show. "America has had French, Norwegian, Swedish, Spanish, Dutch, Swiss and many other commissions, seeking the establishment of greater, more extensive trade relations with America, and even England is turning to this country for relief in the matter of automobile tires."

To make the most of the opportunity now offered in this foreign field, the Federal Rubber Co. moved its export offices from the plant at Cudahy to 38-40 West 62nd street, New York, where, under the direction of G. H. Hamilton, representation has been secured in a large number of important trade centers abroad.

BATES MADE VICE PRESIDENT.

At a recent meeting of the directors of the Amalgamated Tires Stores Corporation, New York City, George J. Bates, who was elected a director two months ago, was made vice president. Mr. Bates was for many years connected in an executive capacity with the Firestone Tire & Rubber and Diamond Rubber companies.

The Ashland Tire & Rubber Co., Ashland, O., is to be represented next year in Europe by George W. Rohn of the export brokerage firm of A. Metzner, Cleveland, O. He will make contracts for Ashland tires in the following countries: France, Holland, Belgium, Switzerland, Germany, Jugo-Slavia, Czecho-Slavia, Roumania and Great Britain.

The Achilles Rubber & Tire Co., Binghamton, N. Y., has increased its capital from $1,000,000 to $2,000,000.

United States Rubber Co. Dividends

At a meeting of the directors of the United States Rubber Co., held Jan. 8, it was announced that a 12½ per cent. stock dividend will be paid on Feb. 19 to stockholders of record Feb. 5. This will amount to $9,000,000 on the common stock. This is an addition to the regular quarterly dividend of two per cent. on the junior issue, which will be paid Jan. 31 to stockholders of record Jan. 15. A quarterly dividend of two per cent. on the preferred stock was also declared, this, too, being payable Jan. 31 to stockholders of record Jan. 15.

It was reported that at the close of the year the company had no outstanding notes or obligations other than current accounts and acceptances necessary in the conduct of its business; that the cash in bank was over $15,000,000 and that there were $2,800,000 of Liberty bonds in its treasury.

The very substantial enlargement of tire plants at Detroit, Indianapolis, Hartford, Providence and Kitchener, Canada, now in progress will, it is estimated, more than double the present product.

G. & J. CO. TO ENLARGE PLANT.

The G. & J. Tire Co. has purchased the entire block of property in Indianapolis, Ind., bounded by Cook, Noble, Louisiana and Georgia streets, on which work on additions and improvements to its plant has been started. When these additions are completed it is stated that the payroll of the company will be $75,000 a week.

The deeds for the new property, 31 in all, were recorded in the name of the United States Rubber Co., the parent organization of the Indianapolis company. The G. & J. Co. manufactures motorcycle tires and inner tubes for automobiles.

KELLY-SPRINGFIELD DIVIDENDS.

The Kelly-Springfield Tire Co., New York, has declared the following dividends:

Quarterly, one per cent., payable Feb. 2 to stockholders of record Jan. 17; stock, three per cent., Feb. 2, to stockholders of record Jan. 17; quarterly, two per cent. on eight per cent. preferred stock, Feb. 16, to stockholders of record Feb. 2; quarterly, 1½ per cent. on six per cent. preferred stock, Feb. 16, to stockholders of record Feb. 2.

NEW DEALER FOR RACINE TIRES.

The business of the Racine Tire & Rubber Co., 180 East State street, Columbus, O., has been purchased by the Dowdell-Horseshoe Rubber Co. and the latter concern will distribute Racine Horseshoe tires and tubes, made by the Racine Rubber Co., Racine, Wis., throughout central and southern Ohio. Those chiefly interested are Raymond Dowdell and C. O. Leonard, both of Columbus, O.

PERTINENT NOTES.

Estimated consumption of rubber for year 1919, 350,000 tons.

Value of rubber industry in America alone, $1,000,000,000.

Seventy-five per cent. of rubber used is devoted to supplying tire equipment for motor vehicles.

Production of tires in this country has practically trebled in five years.

At rate automobile industry is growing, demand for tires will shortly reach 72,000,000 tires a year for motor cars alone.

United States motorists spent over $1,000,000,000 for automobile and truck tires in 1919, not including inner tubes and repair materials.

A UNIQUE INNER TUBE TEST.

A somewhat sensational but convincing inner tube test was made on the streets of Cleveland, O., recently when, as shown in the illustration, a big touring car rolled along having in tow a one-ton Day-Elder truck, the tow line being an Owen inner tube, manufactured by the Owen Tire & Rubber Co. at its factory in Bedford, O.

The tube was not specially built for this test and to prove that there was no trick to the demonstration, the cars halted and Harry Young, the Day-Elder distributor, who was steering the truck, applied his brakes, while the touring car started ahead. With the increasing tension the tube stretched out 20 feet or more before it broke. The crowd who witnessed this culmination of the test were thoroughly convinced as to the high qualities and strength of the Owen product.

ADDITION TO GATES PLANT.

The Gates Rubber Co., Denver, Col., has two additional units under construction, which will increase the floor space from eight to 14 acres, and make room for 500 additional employees. The Gates company recently introduced the Gates Double-Mileage tires.

Big Merger of Tire and Rubber Stores

The American Tire & Distributing Co., Inc., New York City, has just taken over 17 tire stores, that have been in business from three to 10 years, and will continue to operate them as separate units. Each sells automobile tires of all the standard makes and also accessories, both wholesale and retail. In most instances the same men who have made them successful will continue in charge. Following are the stores that are included in this merger: E. Schoonmaker Co., Inc., with stores at 85 Walker street and 835 Seventh avenue, New York City; Newark, N. J., and Utica, N. Y.; Broadway Tire Jobbers, Inc., 250 West 54th street, New York City; Public Service Tire & Rubber Co., Inc., Newark, N. J.; Smith-Haines, Inc., 1862 Broadway, New York City; Associated Rubber Co., Inc., 132 Front street, New York City; Dean Motor Supply Co., Inc., with stores at Albany and Utica, N. Y.; Economy Tire Exchange, Newark, N. J.; Auto Tire Exchange, Inc., with stores at Detroit, Mich., and Newark, N. J.; Henschel Tire & Rubber Co., Inc., 1675 Broadway, New York City; E. J. Willis Co., with stores at 83-85 Chambers street and 65-67 Reade street, New York City; Seaboard Tire & Rubber Co., Inc., 13 Mechanic street, Red Bank, N. J.

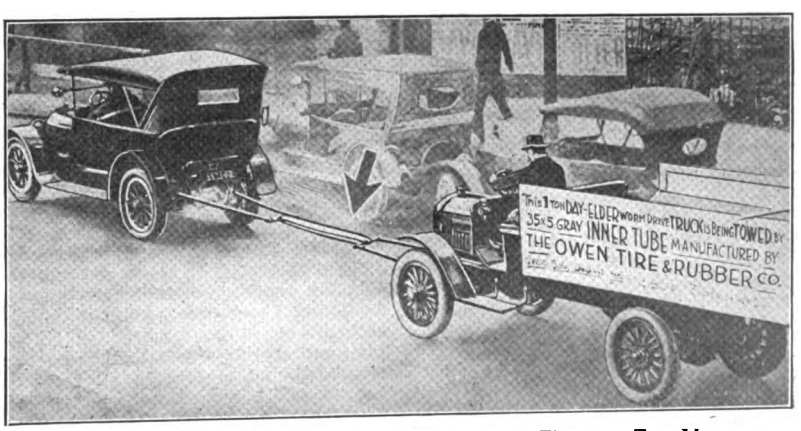
MOVES HARTFORD BRANCH.

The Hartford branch of the Kelly-Springfield Tire Co., New York City, has moved from 41 High street to the Hartford Realty Co. building, Ann street. The manager of the Hartford branch is C. C. Chaffee and the office manager is H. T. Sinsabaugh.

PHOENIX RUBBER CO. EXPANDS.

The Phoenix Rubber Co., Akron, O., is erecting an addition to its plant, which will be 60x120 feet and will cost $60,000.

The Portage Tire & Rubber Co. has filed articles of incorporation at Albany, N. Y., to deal in rubber tires, etc. Capital, $100,000. Incorporators, Samuel B. Howard, George V. Reilly, Robert K. Thistle.



Motor Truck Being Towed by Automobile with Owen Tire as a Tow Line.

Notes of the Industry in Canada

GOODYEAR INTERESTS ERECTING IMPORTANT EXTENSIONS.

The Goodyear Tire & Rubber Co. of Canada, Ltd., has in process of erection at its new plant at Toronto, Ont., three extensions and two smaller buildings. The present main building is 100 feet wide by 460 long, four stories and basement. One of the extensions makes a 100-foot addition to the main building. The other two extensions, measuring 100 by 120 feet, four stories and basement, are connected to and run south of the main building. There is also under construction a building 50 by 80 feet, to be used for the manufacture of chemicals, and another 50 by 75. These various additions will give an increased capacity of 1000 pneumatic automobile tires a day, bringing up the output to 3500 tires a day. In addition to automobile tires the plant is thoroughly equipped for the production of motorcycle and bicycle tires and rubber accessories. The factory has been operating at full capacity, 24 hours a day.

K. & S. Tire & Rubber Goods, Ltd., Toronto, Ont., reports that for the first six months of 1919 its net earnings were $75,080.57, and it is estimated they will exceed $135,000 for the entire year. The net earnings in 1918 were $85,245.91. Gross sales in 1918 were $593,000, and for 1919 are estimated at $1,000,000. With the additional plant in operation, it is estimated that gross sales will reach $1,600,000 in 1920 and over $3,000,000 in 1921; and that the net earnings for 1920 should be $225,000, and for 1921 over $400,000.

The F. E. Partridge Rubber Co., Ltd., Montreal, Que., is building a four-story addition, 60 by 100 feet, which will afford employment for an increase in workmen from 350 to 500. This company makes Partridge rubber tires, tubes and rubber sundries, such as hot water bottles and tobacco pouches, the daily output at present being 475 tires, 600 tubes, 500 hot water bottles and 1000 tobacco pouches.

The Oak Tire & Rubber Co., Ltd., Oakville, Ont., manufacturer of Royal Oak tires, has production plans calling for the enlargement of its factory this spring by the addition of another story, 60 by 200 feet, which will enable it to double the present output. Ninety hands are now on the pay roll and the plant has been running 23 hours a day.

The Canadian Consolidated Rubber Co., Ltd., has appropriated $1,000,000 for the enlargement of the Dominion tire factory at Kitchener, and the work is now going on. Extensions are being erected at both ends of the factory, each being 110 by 130 feet, four stories high and giving 143,000 square feet additional floor space. This will more than double the present capacity.

The Goodyear Tire & Rubber Co. of Canada, Ltd., whose headquarters are at Toronto, Ont., has opened an office and warehouse for handling its trade in Northern Saskatchewan in the Ross block, 118 Third avenue, South, Saskatoon.

The Gregory Tire & Rubber Co. is planning to build a plant at Port Coquitlam, B. C., at a cost of $175,000. The managing director of the company is J. A. Cunningham, president of the British Columbia Manufacturers' association.

The Canadian Consolidated Rubber Co., Ltd., is planning an enlargement of its plant at Port Dalhousie, Ont., to cost $80,000. A pressure vulcanizing plant that will cost approximately $35,000 is one of the principal units to be added. The vulcanizing process will be used in addition to the heater curing system.

The Amee-Holden Tire Co. announces the completion of its factory at Kitchener and will be in a position to make tire deliveries early this spring. The common stock of this company, which went as a bonus with the seven per cent. bond issue, was recently quoted at $40 to $41 a share.

SPECIALIZES IN INNER TUBES.

The Courier Rubber Co., Inc., recently formed, has opened sales offices at 150 Nassau street, New York, and is pushing the distribution of the Courier Red Floating inner tube, its experts being convinced of the superiority in general of red tubes over gray. The Courier Red is a non-blooming product. The Courier company also manufactures a gray tire which is guaranteed to have equally good physical qualities. It is claimed that the Courier tubes will stand all recognized tests as to tear, etc. The guaranteed specifications are as follows: Specific gravity, .98, i. e., floating stock; tensile strength, from 2500 to 3000 pounds a square inch; a stretch from 8½ to 9½ times its original length.

The president and vice president of the Courier Rubber Co. are, respectively, Robert E. Clift and William D. Laurie, both well known in the rubber trade.

VICTOR CO.'S EXTENSIVE BUILDING SCHEDULE.

The Victor Rubber Co., Springfield, O., is in the midst of an extensive building schedule, which is making possible the constant increase in production. Early in 1919 the first unit in the new programme was completed and the cord tire department is just now moving into the second building. In addition to these a large structure is under way which will house a battery of new vulcanizers.

These units will provide over 25,000 additional feet of floor space and will enable the organization to double the production of Victor tires. All of these new units are of uniform construction, hollow tile, entirely fireproof, light, perfectly ventilated and modern in all respects. For the past few months the factory has been operating at capacity, 23 hours a day with three shifts.

Changes in Firestone Personnel

NEW SUBSIDIARY OF THE HOOD RUBBER CO.

The Firestone Tire & Rubber Co., Akron, O., has made the following additions to and changes in the personnel of its various departments and branches: Joe M. Dine, former special representative of the truck tire department in the Northwest, with headquarters at Minneapolis, has been designated as branch manager at Dallas, Tex. L. A. Brown will succeed Mr. Dine at Minneapolis, being promoted from truck tire sales manager. James Roddy, a salesman, succeeds Mr. Brown. C. W. Brown of the branch operating department, has become office manager at St. Louis to succeed M. O. Halverstadt, who goes to Des Moines, Ia., to take over the duties of office manager in the place of G. H. Smoots, resigned. A. W. Hugh, office manager at Columbus, O., has been transferred to a similar position at Fargo, S. D. George Jacoby goes from Toledo, O., to Great Falls, Mont., as office manager, and E. A. Snyder goes from Kansas City to Minot, N. D., in a similar capacity. L. E. Steele, city salesman at Milwaukee, Wis., has been transferred to the Chicago branch. A. L. Miller, salesman at the San Francisco branch, has been promoted to be special pneumatic sales representative in the same district. H. J. Guther, city salesman at Chicago, has been appointed special representative for truck tire sales, with headquarters at Chicago. M. D. Millan has become city truck tire salesman at Spokane, Wash., and Frank H. Gilchrist a truck tire salesman at Omaha, Neb. C. H. Gerhold, formerly of the western division of cycle tire and accessory sales, has been made manager of the new tire accessory sales department. H. P. McWilliams becomes cycle tire sales manager, coincident with the consolidation of the eastern and western sales division of the motorcycle and bicycle tire sales departments, both trade sales and manufacturers' sales promotion coming under his jurisdiction. A recent acquisition to the selling organization is George W. Keller, who becomes special representative of the new cycle tire sales department, with headquarters at Chicago and territory embracing several states.

The Hood Rubber Co. of Watertown, Mass., has formed a new subsidiary under the name of Hood Products, Inc. The new company, which will deal in all kinds of rubber and leather goods, has been incorporated under the laws of Massachusetts with a capital of $1,500,000, consisting of 10,000 shares of preferred and 5000 shares of common stock. Dividends on the preferred stock will be cumulative at seven per cent.

The Ibex Tire & Rubber Co. of Canada, recently incorporated, is making plans for the erection of a factory at Oshawa, Ont. F. W. Bull is president of company.

Up-to-Date Methods of Vulcanization and Suggestions

Compiled by the Goodyear Tire & Rubber Co.

A RECENT 6000 mile inspection tour in the interest of vulcanizers, revealed the surprising fact that a large percentage of those who are having trouble with vulcanizing work, with equipment and with repair materials, feel that, regardless of how they handle repair materials and equipment, good results can be and should be obtained.

Now the day of the unskilled repairman has gone. He is rapidly being replaced by the tire surgeon, skilled in his work and rigidly adhering to certain fundamental laws which underlie it. Like the medical surgeon who operates upon a patient, carefully observing all natural physical laws and governing his work by the best accepted practise, the tire surgeon must conform his work to certain natural laws. He must not substitute haphazard methods if he expects success as a vulcanizer and repairman. He dare not ignore the methods of using repair and vulcanizing materials which costly experiments and careful study have proven.

On this trip a repairman who had asked that an expert be sent to his rescue was visited. This man was having serious trouble, although he had had long experience in the business. It was found that he had raised the steam pressure contrary to specifications, so that a cracking of tread material resulted. When questioned about this he replied: "Oh, I know 40 pounds of steam is specified for this cure, but it takes too long. Sixty pounds let's me get out more work. In this way I shorten the time of curing." Expert advice had been disregarded and yet good results were expected.

Another vulcanizer was visited. This man had had special training and had been taught to cut his fabric on the bias, had been given the reasons for doing so and had been assured that excellent results might be expected from this method. Nevertheless, he was found cutting the fabric straight.

These are only examples of conditions found to be widely prevalent. In some cases lack of knowledge of tire repairing was the trouble. In others it was the disregard for established rules which had been taught. Now a man working a problem in addition would not expect to get the correct results if he applied the rule for multiplication. The same principle holds in repair and vulcanizing work. Certain things are known absolutely to be true. It is the interest of the tire repair man—tire surgeon—to get behind a movement, thus increasing the confidence of the tire using public, that will result in better tire repairing.

It is a good plan to give this idea two or three months trial for comparison with past records. Make the repair shop something pleasing to the customer both in appearance and workmanship. Devise a systematic way in which to carry on repair and vulcanizing wrok. Check up shop leakage.

One repair shop visited was a very large one; its proprietor was a busy man who operated a large service station and an accessory store in connection with the repair shop. The repair department was left entirely to the foreman; the owner seldom visited the work room. While going through this room a small box of uncured trimmings was noticed. The box contained a mixed collection of black, white and gray tread gum, cushion gum, building fabric, dust and dirt, together with dried cement. Two full barrels of this same collection was found, practically valueless. It probably weighed 400 pounds in all. This material, had it been kept free, separated and clean, was worth approximately $200. As it stood $30 would have been a good price. There was, therefore, a waste of $170. This is but an example of many similar kinds of leakage noticed.

If the vulcanizer expects to get the results and profit that are rightfully his, it is absolutely imperative to check up on these things.

Method of Mending Large Hole.

A practical method of putting fabric in a section where there is a very large hole or where there is nothing much left but the beads, is to cement the iron core and stitch a ply of fabric down to it. Set the tire over it, stick the beads fast to the core in the usual position. This gives a natural foundation on which to build up the section in the ordinary manner. All the chafed and dirty fabric should be trimmed off around the beads. With this method the correct size and shape of the casing may be maintained.

A few weeks ago in visiting a repair shop, the operation of preparing a casing for a retread was carefully noticed. The old tread was worn, loose and badly cut up. The repair man skinned the old tread off, buffed the carcass and cemented it.

Now several places were noticed where water and dirt had soaked into the fabric. When buffed the old fabric was white and lifeless and rotten. These places, if not watched, will develop separation or loose spots. It is a much better practise to step out a patch at this point and replace it with a clean, new piece of material. In taking this precaution many tread separations will be prevented.

It is poor practise to place the hand on uncured stock while sticking it on the casing, as this will imbed dirt in the material. The sweat also takes away the tacky condition of the stock. Do not handle repair material any more than can be helped.

A section was cut down, the casing buffed and then washed, the rag was very heavily loaded with solvent and the old material and fabric was heavily saturated. After allowing it to stand a very few minutes, cement was applied. As a result a very porous condition developed in the cure, as the solvent had not entirely evaporated. In washing casings, merely use a slightly moistened rag to clean out dust and dirt.

Breaker Strip Loosened.

In making a cure on a sectional retread job a Texas repair man found that the old breaker strip, apparently sound and good, would come loose, spoiling the job. He inquired what might be the cause of the difficulty. There are several possibilities, one is that tread cuts when left to care for themselves, permit water to soak into the carcass and destroy the texture of the breaker. Cement conditions not thoroughly dry or oil in solvents will also loosen the breaker.

Trouble with Air Bags.

A great deal of the trouble experienced in handling air bags is due to improper application for the most part. In handling old stretched casings and poorly fitting bags, the repair man should take care to pad the air bag to fit the casing. The reason for this is that air bags should spread the beads of the casing three-quarters of an inch before it is properly fitted. The bead molds are then applied and the clamp screw turned until the cavity mold fits snugly to the walls of the casihg. Then the air bags should be inflated five pounds and the clamp screw given a three-quarter turn. Now inflate the bag to the proper pressure. Be sure that the air bags are centered in the molds so that only the heavy ends protrude beyond the ends of the cavity.

Get Pure Solvents.

Solvents continue to give vulcanizers as much difficulty as any one thing in the process of repairing. Most of the faulty curing is due to impure solvents. Care should be taken to obtain the purest sort of solvent on the market free from all traces of oil. In washing stock and thinning cement, traces of oil do damage that makes a perfect job impossible.

Answers to Queries.

A western repair man asks this question: "Should one or two plies of cord be left when a blowout is being repaired?"

Cords in the cord tire are laid in groups and must be removed as such. For instance, remove the two sets of plies as follows: Inside first, then the outside group. This will allow replacement.

A repairman from Salt Lake City asks how many plies of cord there are in cord tires. A 3½-inch tire has four plies; a four-inch six plies: a 4½-inch tire six plies, and a five-inch tire eight plies.

Vulcanizers often ask the question: "How can I tell if the job I finish is cured, under-cured or over-cured?" When a tire is overcured it is very hard and firm and if tried with a pencil, gouges out in small chunks, while if the job is under-cured, the pencil jabs will remain and show as dents in the rubber. If properly cured the tire will not show where the pencil jabs were made and will cure with a fine "bloom."

PLATE XLIII.

DESIGN FOR GASOLINE AND OIL SUPPLY STATIONS

Plans Presented for a Large and Two Smaller Filling Depots, Combining Utility and Attractive Features.

(Designed by the Architectural Department of the Automobile Journal Publishing Co.)

THE design shown and listed as No. 1, Plate XLIII, is laid out for a plot of land 50 by 100 feet. It presents real novelty, yet it is extremely practical owing to the fact that cars stopping to purchase gasoline and supplies will not interfere with regular traffic on the highway in any way. They may drive in off the street completely, pull up to a pump, get supplies and drive on out through the other end of the structure. It will be noticed that the cars drive in at the right hand opening or entrance and out by the exit at the left. A complete semi-circle is described, stops being made only at the pumps, the first car in stopping at the point farthest from the point of entrance, thus allowing three cars to be filled at one time.

The oil pumps are located between the gasoline pumps, there being a total of four. In addition to the oil and gasoline pumps, at least one air tube should be provided.

The driveway is covered, insuring dryness at all times, and during cold weather provision can be made to close in the doorways.

A glance at the plan will reveal the general design of the structure. It is rectilinear in front with a semi-circular bay, as shown, at the rear. To the right of the salesroom is the entrance to the drive, and on the left is the exit, arrows showing the direction. In the store, provision is made for the display and sale of accessories, its dimensions being 32 feet front, with a depth of 25 feet. No stairway to the basement is shown, this being placed where most desirable to the owner, either inside the store or outside from the drive. In the basement a toilet and wash room can be provided, and there is a large area for storage.

Hollow tile walls covered with stucco, trimmed with concrete stone or terra cotta. Foundation of concrete, all walls being at least 12 inches thick with spread footing as shown. Floor of reinforced cincrete with tile inlay. Roof of tar and gravel, properly drained. Heating by steam, electric lights, standard plumbing, etc.

A structure similar to this may be erected for $3000 to $4000.

DESIGN NO. 2.

This little station has been designed to meet the approval of many who want something different yet classy and snappy in appearance. In size it is just 14 feet square. It has openings on all sides, as shown in the elevation. These openings are horseshoe shaped, having doors in two ends, as shown, which give access on a direct axis. As to location, it is shown free-standing, or accessible from all sides and having pumps located at the corners.

It is built of hollow tile covered with stucco having colored tile inlaid to give life to it, contrasting with the white walls. The corners are flanked by buttresses that add immensely to its character, giving a substantial appearance.

The foundation is of concrete with 12-inch walls having spread footing as shown. A basement may be built in which a toilet and wash room could be installed, this being reached through a trap door in the floor by means of a stairway or ladder. The super-structure is hollow tile covered with stucco, eight-inch walls being ample; wood cornice as shown with wooden roof covered with metal, painted red, to give a striking contrast.

The approximate cost would be $700.

DESIGN NO. 3.

A slight variation is here portrayed in the filling station idea. It is a building 14 feet wide and 18 feet long, designed to be erected between two larger structures, utilizing the ground area of what might be a light court.

A glance at the plan will reveal the design. There are three oil pumps, a show case for display and shelves, and a stairway leads to the basement, where provision may be made for toilet and wash room; also space for a small heater, leaving ample room for storage.

The construction is a combination of brick or hollow tile faced with terra cotta. Around the window opening an ornamental band of terra cotta is shown. A classic cornice tops off the front, surmounted by a balustrade on which rests a cartouche out of which springs a flag pole.

The foundation is of concrete, with spread footing, as shown. The floor is of reinforced concrete with tile finish laid in white cement mortar.

The roof, if within the fire district, must also be of concrete, covered with a tar and gravel composition. To give a novel and individual character to the building, colored terra cotta may be used.

A building like the one described would cost about $1500.

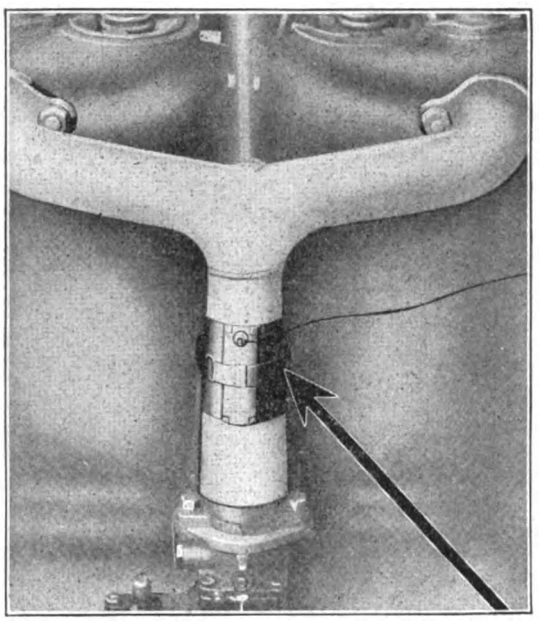
Starting Engines in Low Temperatures

Many Devices for Heating Carburetors, Different Forms of Primers and Garage Heaters of Various Types

STARTING an engine that is cold, especially when the temperature is low, is often difficult. Occasionally real labor is necessary. And in any event the cause, provided the ignition system has not failed, is due to slow volatilization of the fuel.



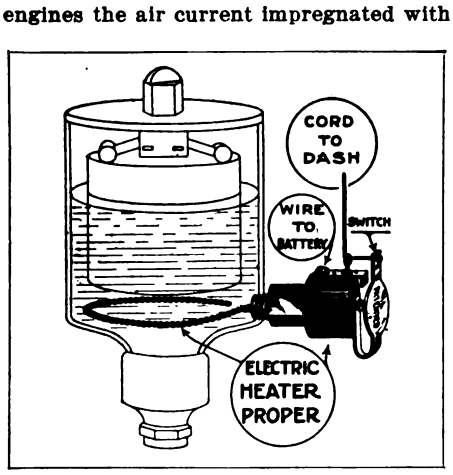
Electric Intake Heater—Electric Intake Heater Co., 115 East Cortland Street, Jackson, Mich.

Gasoline in liquid form is inflammable, and only when it is converted into vapor or "gas" by what is known as the process of evaporation will it become explosive, and it will not ignite instantaneously until it is combined with a certain volume of oxygen from the air.

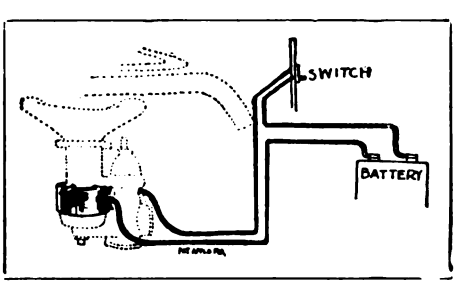
Carburetion may be defined as mixing gasoline vapor with air either by passing an air current over a volume of gasoline or projecting the gasoline as a spray into a current of air. With internal explosion engines the air current impregnated with gasoline is carried into the cylinders and ignited. Carburetor adjustment then is to so proportion the volume of gasoline vapor and air that a combustible mixture is formed.

Carburetion cannot be begun until the air current begins to move through the carburetor, and as gasoline will evaporate in ratio to the specific gravity of the oil with reference to temperature, with cold air and cold fuel the combustible gas originates very slowly. For this reason heating the gasoline until it will volatilize rapidly will promote carburetion. After carburetion has been begun the mixture will improve as the engine heats until it will have what may be termed as maxmium combustibility with a given carburetor setting.

Primarily, then, heating the fuel will improve the mixture. This may be done in several ways, by pouring hot water on the carburetor, by wrapping cloth saturated with hot water about the carburetor, by wrapping a heated chain around the carburetor, or best of all, winding a heated sand filled cloth tube around the carburetor and intake manifold. The use of water is not advised because it chills quickly and is by no means positive, while there is a possibility of water entering the air intake.



Quick-Start Carburetor Heater—Thompson Manufacturing Co., 811 24th Street, Des Moines, Ia.

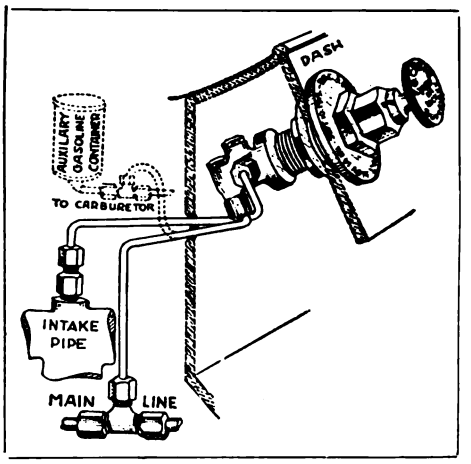


Electric Carburetor Heater—Mechanical Utilities Corporation, 5 North La Salle Street, Chicago.

A chain or a sand bag can be well heated and will sufficiently increase the temperature of the carburetor to positively volatilize the fuel, and either can be used as frequently as desired wherever heating them is practical. They will be useful in any private garage, but, of course, will not serve when a vehicle is left standing exposed in a street, for instance.

Priming the Carburetor.

Priming a carburetor is merely admitting more fuel into it so that a greater volume of gasoline vapor is carried into the cylinders of the engine, but there is no possibility of determining that what is admitted will be a combustible mixture, and while there may be too small a volume of gasoline vapor to burn when a spark is made, there is equal probability that the volume will be such that it will prevent combustion. That is, the fuel may be of such proportions that it will not burn because it is either too rich or too lean. If the gasoline volatilizes slowly it may be lean, or if the carburetor is flooded it may be too rich. In either event the engine must be turned until the fuel admitted will burn, either from increased volume of gasoline vapor or reduction of volume as the mixture is passed into and exhausted from the cylinders.

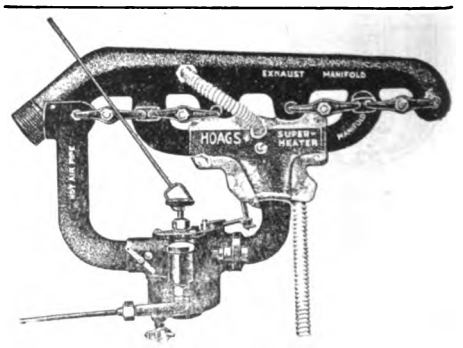


Crone Primer—F. G. Crone, 281 West Ferry Street, Buffalo, N. Y.

Priming the cylinders direct by injecting gasoline into them through compression relief cocks or spark plug bores causes practically the same conditions as have been described as resultant from priming the carburetor. The mixture may be lean or rich or combustible, but in any event this is a hit or miss method.

Engine Must Be Turned.

Either form of priming necessitates turning the engine; if this is done by hand more or less labor is certain and if the engine is started by a motor there is considerable drain on the battery. Good judgment dictates that the battery power be conserved. Unless the mixture is such the engine will start whenever

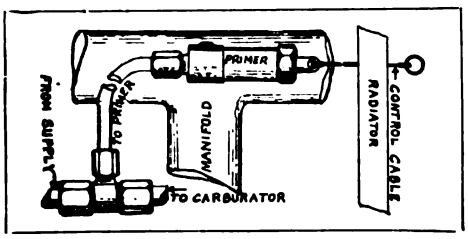


The Hoag Manifold Superheater—Hoag Superheater Co., Inc., 21 Park Row, New York City.

Digitized by Google

turned the battery will be worked excessively.

Without question the best results are obtainable from keeping the machine in a temperature that will cause free volatilization of the fuel. This can be done in a heated garage, and the initial start of the day can be made by use of the heated chain or sand bag. But there will



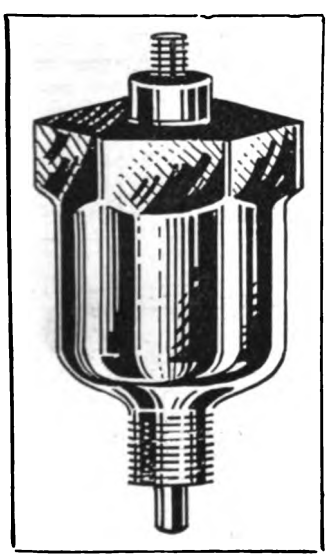
Crone Primer for Fords—F. G. Crone, 281 West Ferry Street, Buffalo, N. Y.

be the same obstacle when starting cold elsewhere.

Different Forms of Primers.

Differing forms of priming devices have been invented—the number that has been produced commercially is large—and these are claimed by the manufacturers to be very efficient. Some of these are electrical, current drawn from the battery heating a coil installed in the intake manifold until the engine has been started. Others draw fuel from the supply tube between the tank and carburetor and inject it into the intake manifold. The principles of these auxiliary starting devices are substantially the same, but the details differ somewhat. The main object is to get combustible fuel into the engine cylinders.

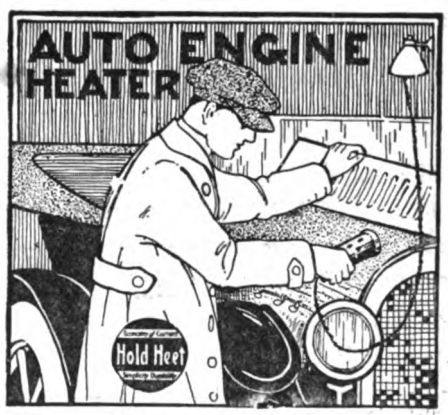
As the temperatures will vary widely and the starting mixture must be approximately to a standard of combustibility, the heating device used must be adequate for any temperature from perhaps 25 below zero as a minimum. The ideal auxiliary is what can be installed on a vehicle, and generally speaking the best result can be obtained from electric heat, for this can be used in any condition. If the engine has cooled and is outside of a garage, no device will be of value for starting. Turning the engine with the electric motor obviates labor, but it is necessarily expensive in cold weather, because the average generator will not sufficiently charge the battery, and this means occasional outside charging with the complications that result from overcharge.



Great Western Electric Carburetor Heater—Great Western Commercial Body Co., Omaha, Neb.

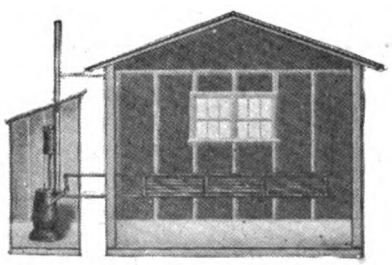
Heavy Drain on Starting Battery.

The average electric lighting and starting system is designed to charge the battery only when there is no light load—the lights not burning—and when the lamps are lighted the current generated will be approximately what is required for them. If the lamps are lighted and the engine is not running there is a drain on the battery. In cold weather the hours of use by daylight, when the battery can be charged, are comparatively short and the demands upon the battery are excessive. If the starts are numerous the draft on the battery will be heavy and the charging is seldom up to maximum unless it is supplemented occasionally from some outside source.



Electric Automobile Engine and Radiator Heater—Russel Electric Co., 140 West Austin Avenue, Chicago.

When the engine is cold and the oil is at lowest viscosity the pistons may be so anchored by the thickened oil that the crankshaft can only be turned with twice the power that would be necessary in warm weather. Starting in such condition necessarily means heavy battery draft, and to add to this the battery capacity is decidedly lessened by low temperature and by rapid discharge, so that



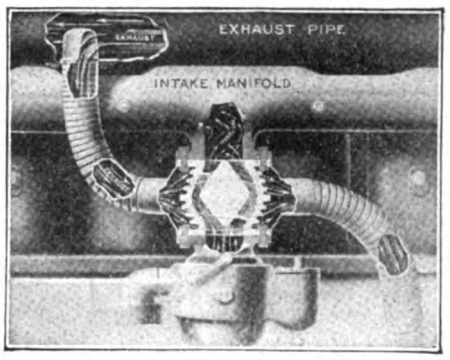
Wasco Ready-to-Set-Up Garage Heating System. W. A. Schleit Manufacturing Co., Inc., Syracuse, N. Y.

with the three results in combination the battery is greatly reduced. This being so there is the more reason for doing all that is possible to have efficient initial carburetion.

Garage Heaters of Various Types.

With reference to heaters that can be used in garages, these are very numerous. The manufacturers make all manner of claim for them. Some are electrical, being in effect a coil or heating unit that may be coupled to a lighting circuit at a lamp socket and placed under the engine hood. If covered with a blanket the radiator will be kept at a temperature that will be sufficient protection and insure easy starting. Other heating devices burn briquets, on precisely the same principle as car heaters, being placed on or close to the engine under the hood of the car.

Garage heaters are various types and turn gas, oil or may be connected with



The Losee Protect-O-Motor "Hot Spot." J. S. Losee, Hebron, Ill.

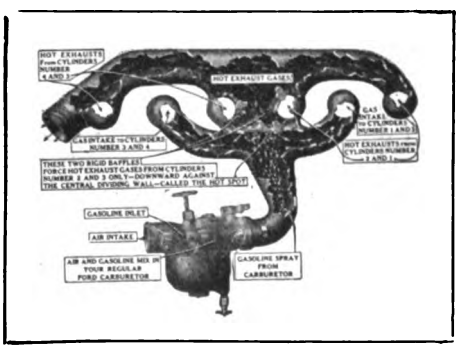
the heating systems of houses. Others may burn coal or coke. Some are designed to be placed near the radiators, and some are intended to heat water that circulates by thermo-syphon movement through the radiator. The car owner can select from these whatever will best suit his own purposes and his own purse.

Little Heat Needed to Prevent Freezing.

Surprisingly little heat is necessary to insure a radiator against freezing in a garage and a single electric light if placed under a hood covered with a robe will be sufficient protection. Where antifreezing solutions or alcohol are not used the only safe protection is draining the radiator, and this should be done each night after the vehicle is used.

When refilling the radiator and engine jacket in the morning, however, care must always be taken not to use water that is hot, for this might crack the cylinders.

When starting a cold engine do not, if started with a motor, keep pressure on the starting switch after firing has begun. Do not race the engine, but let it idle until it is warmed and is firing regularly on all cylinders. Running an engine fast without a load will result in damage or unnecessary wear and needless consumption of fuel.



Anco Evenheat "Hot Spot" Manifold—The Anderson Co., South Bend, Ind.

(Continued from Page 32.)

equipment was graphically represente and under continuous demonstration.

One of the most interesting exhibits, in the light of the recent agitation in regard to short measure given at oil filling stations, was a new visible measure shown in connection with an oil supply pump and tank. The appliance is supplied with a 10-gallon glass container marked off into gallons, visible to the purchaser at all times. As a fresh supply of liquid is pumped up through a rubber tube, the amount already in the container is automatically emptied into fuel tank of the buyer's car, so that by noting that the container is filled each time and keeping count of the number of times the container is filled and emptied, the customer can be sure that he is getting the full amount paid for.

There was also a comprehensive display of head lights, spot lights and patent dimmers, all designed to comply with the present regulation in various sections of the country.

Speedometers of various types were belted to motors, demonstrating their principles of operation and utility. Some devices for the dash board were so complete as to afford an adequate record of whatever the motorist would desire to know concerning rate of travel, trip and total mileage, oil and fuel consumption, tire mileage, condition of electrical equipment, etc.

The showing of magnetos, storage batteries and electrical devices was especially complete.

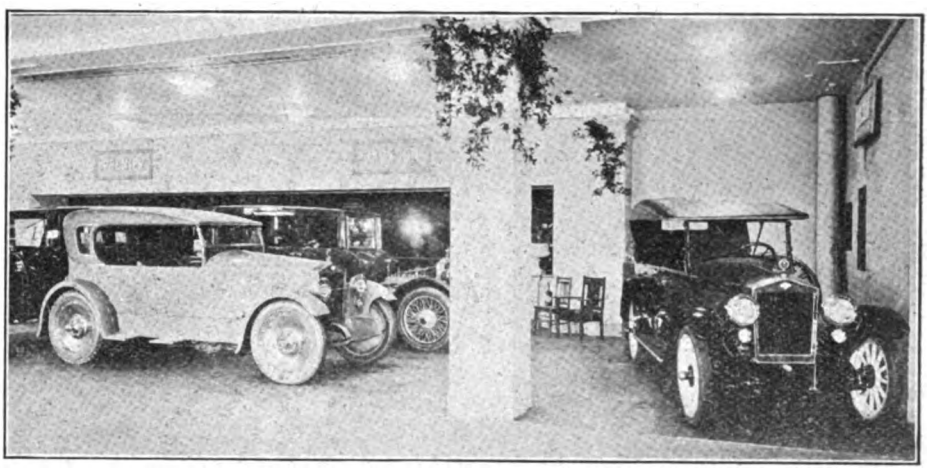
One of the most attractive booths was devoted to robes, auto gloves and especially designed automobile coats, caps and other wearing apparel.

OFFICIALS OF THE SHOWS.

This 20th national automobile show was held under the auspices of the National Automobile Chamber of Commerce, which has been so conspicuous in its successful sponsorship of similar events.

The entire executive department has been in the hands of Samuel A. Miles, whose enviable record as a manager of these nation wide exhibitions is coincident with the shows themselves and forms a notable chapter in the history of American automotive activities.

The president of the Chamber of Commerce this year is Charles Clifton, one of the best known representatives of the industry, and associated with him are the following committees: Passenger car section—John N. Willys, Willys-Overland Co., Cleveland, O., chairman; H. G. Root, Westcott Motor Car Co., Springfield, O.; Harry M. Jewett, Paige-Detroit Motor Car Co., Detroit. Truck section—Martin L. Pulcher, Federal Motor Truck Co., Detroit, chairman; A. J. Whipple, Diamond T Motor Car Co., Chicago; David Ludlum, Autocar Co., Ardmore, Pa.



Up-to-Date Disc and Wire Wheel Equipment Shown on Jackson Cars, Made by Jackson Automobile Co., Jackson, Mich.

CHICAGO SHOW, JAN. 24-31.

The majority of the exhibits were seen again at Chicago the week of Jan. 24-31, the passenger cars and accessories at the Coliseum and Annex and First Regiment Armory. and the truck section and accessories at the International Amphitheater.

The enthusiasm at Chicago proved as great as that manifested at New York. This show has always been considered as the big retail exhibit of the Middle West and it fully sustained its reputation this season.

All of the best exhibits seen at New York were repeated here and many interesting additional features were noted. In fact, it is stated that the western show was more comprehensive in some respects than its eastern predecessor, as many of the cars which were seen in hotel corridors, and some others in private displays, were in the main buildings at Chicago.

As to the amount of business transacted, while many actual sales were made, the local dealers seemed more concerned in ascertaining the number of cars they might by any possibility include in their allotment for the season rather than taking orders for immediate delivery. Conditions have emphasized the fact that was evident at New York that the visible supply of cars is unquestionably entirely inadequate to meet the increased demand.

The location of the building devoted to commercial cars was more favorable than at New York and this is stated to have had a salutary effect on the interest manifested and the amount of business transacted in this division of the exhibition.

In regard to new cars seen at Chicago, they were built to a high standard, and followed long established lines of design in construction, appointment and finish. As at New York, the six-cylinder car dominated, more than 50 per cent. of the models in the passenger car section being equipped with engines of this power.

The following percentage table of chassis production, embracing every make of American car, shows how the tide has turned in the last 10 years in favor of the six-cylinder type:

Year	Sixes	All other types
1910	10	90
1911	17	83
1912	19	81
1913	36	64
1914	45	55
1915	47.5	52 5
1916	45.8	54.2
1917	47	53
1918	51.7	48.3
1919	53.2	46.8
1920	55.8	44.2

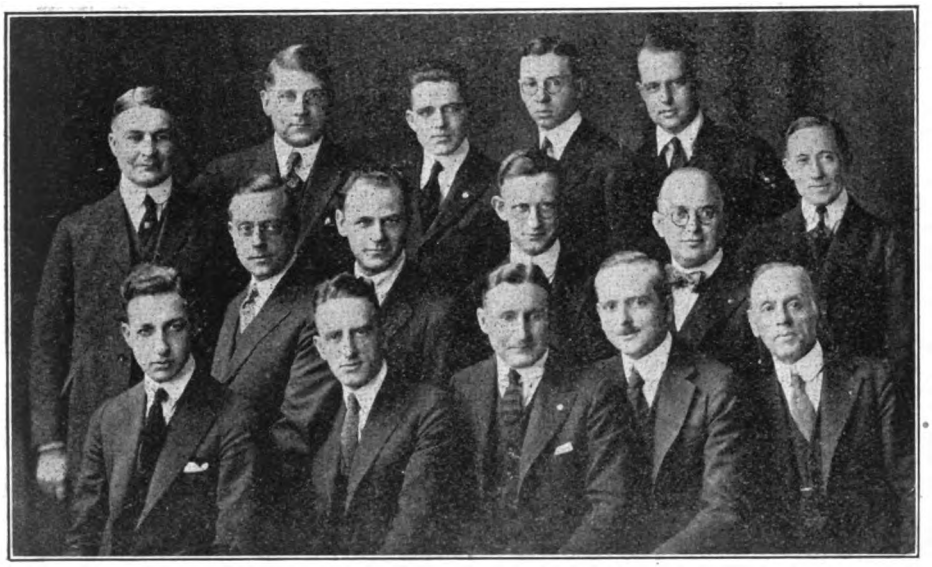
Sales Managers, Bailey-Drake Co., Meet at Home Office in Chicago



Group of Sales Managers of the Bailey-Drake Co., Chicago, Ill., Distributor of Automotive Products.

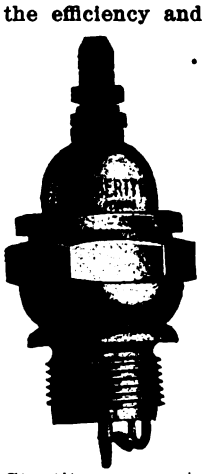
THE accompanying illustration shows a group of branch managers of the Bailey-Drake Co., which recently met at the home office of the company at Chicago, to plan the sales campaign for the present year, the organization covering all parts of the United States.

At this convention it was announced that national sales work had been assumed for some dozen or more important automotive products, including the following: Jackson pneumatic and electric drills and pneumatic valve grinders, made by the Kalamazoo Railway & Supply Co., Kalamazoo, Mich.; Ibsco battery steamer, made by the Illinois Battery Steamer Co., Peoria, Ill.; the Klemme auto hoist and crane, made by the Klemme Manufacturing Co., Davenport, Ia.; the Mentor auto horse, made by the Safety Equipment Co., West Mentor, O., and the Nazett burning-in device, made by the Nazette Manufacturing Co., Eldora, Ia.

The Bailey-Drake Co. was established in San Francisco in 1908, but its rapid growth made a central location of the head office imperative. The president, Fred V. McGraw, advises that the activities cover the entire United States and Canada, with headquarters at Chicago, and branches in New York City, Detroit, Atlanta, Ga.; Dallas, Tex.; Kansas City, Mo.; St. Louis, Mo.; Minneapolis, Minn.; Seattle, Wash., and San Francisco.

LIBERTY SPARK PLUGS.

Extremely broad claims are made for the efficiency and endurance of Liberty spark plugs, made by the Federal Corp., 100 North Elm street, Westfield, Mass., a concern that specializes this product in a large plant with every facility for high grade production. The plugs are made to exclusive design and this and the use of materials are covered by application for patents now pending.



The insulators are Steatite, a material that cannot be broken by extremes of heat or cold, is proof against electrostatic puncture, and will endure against shocks that would shatter porcelain. The heavy shell is brass and the dome shaped insulator is capped with a brass connection. The shapes of the center and shell electrodes are such that oil cannot accumulate upon them in sufficient volume to soot or carbonize, and claim is made that they are in effect self-cleaning. These plugs are made in all standard sizes and they are sold for $1.50 each.

NEW STERLING TREAD.

The Sterling Tire Corporation, Rutherford, N. J., announces that the new Sterling vacuum tread is being adopted for its large size tires as rapidly as the equipment can be placed in commission. It has been tested out under the same conditions as the bar type and is reported to give even greater mileage.

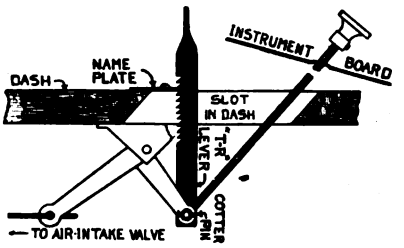
It is stated that as a rule nearly all types of tires are run with insufficient air pressure and when semi-flat the bars, and for that matter any marked raised figures, work on the fabric layers beneath with an uneven kneading action, tending, after long mileage, to separate the layers. It is claimed that the new vacuum tread affords an equal bearing surface over its entire circumference, and that it is also free from the kneading caused by raised figures, which tends to "ball" the friction and make blisters.

"T-R" STARTING AID FOR FORD CARS.

The Tolman-Reeve Engineering Corporation, Chicago, Ill., has just brought out a new and interesting little device, known as the "T-R" Starting Aid for Ford cars, which is something of an innovation in the field of Ford accessories.

It is made in two models, the No. 1 being adapted for the older Ford cars without self-starting equipment, while the No. 2 is for cars equipped with self-starters. Model No. 2 is represented in black in the sketches. It consists of a toothed lever and a name plate. As the choke rod in the Ford self-starting device is raised the notches in the lever engage the name plate and hold the choke rigidly at any desired point. When the lever is tripped by a touch of the foot the choke snaps back to normal through the action of the spring in the carburetor.

Model No. 1 for hand-cranked Fords fills even a greater need than the No. 2, for it supplies the equivalent of the Ford dash choke arrangement found only on the self-starting cars plus the "T-R" Starting Aid feature of fixed choke control. Dash choke control is thus obtained absolutely independent of the wire choke device at the radiator.

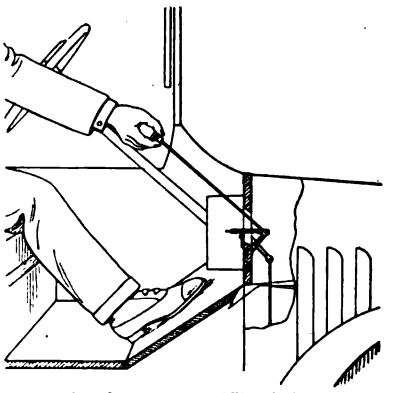


Model No. 2 "T-R" Starting Aid for Ford Cars.

Most drivers, in order to obtain easy starting use a carburetor mixture richer than necessary when the engine is warm. This is unnecessary with the "T-R" Starting Aid, for the carburetor can be set at a thin mixture and a partial choke used for driving the engine while cold.

The device is unique in its ease of installation, its simplicity, the manner in which it fits in with the Ford choke equipment of the self-starting cars and the precision with which it functions. Installation is effected in less than five minutes by inserting the lever in the slot already existing in the Ford dash, cottering as shown and screwing on the name plate.

The model No. 1 retails for $1 and the model No. 2 for 75 cents.



Showing Application of "T-R" Starting Aid on Ford Car.

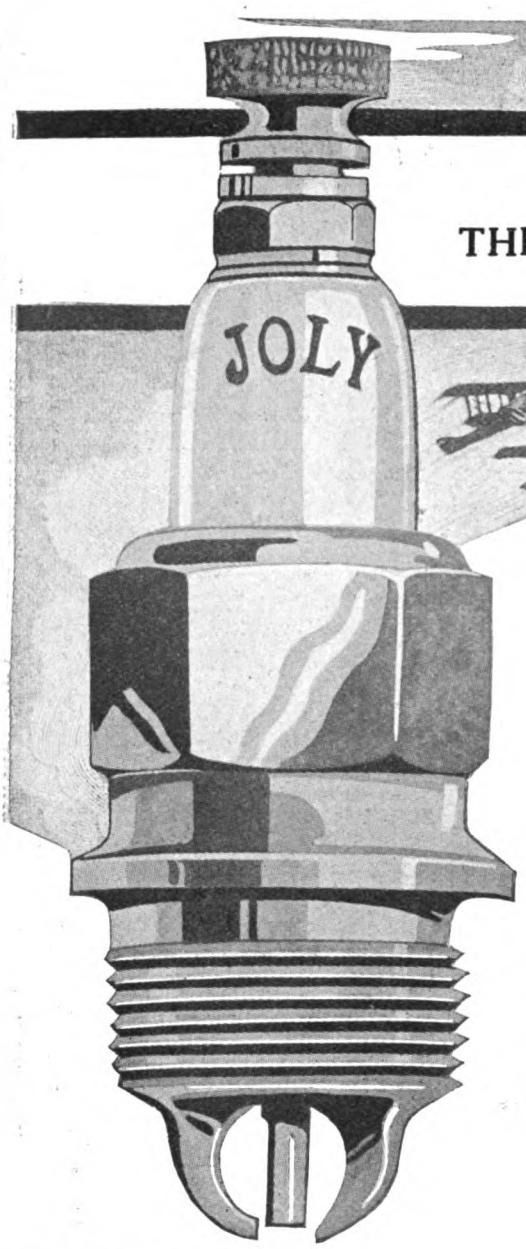
THE WORLD'S BEST PROVED SPARK PLUG



THE "plug weary" millions of car, truck and tractor owners have been waiting for a plug such as the Joly—They have bought on advertised claims, and on recommendation, but it has been the same old story of trouble and short life.

DEALERS—We want you to line up with—stock up with—The Joly Spark Plug—the plug

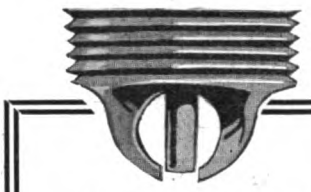
That Sells on Records and Design and Forever Stops Annoyance and Trouble

For Four Years All Allied Combat Airplanes Fired Their Motors With the Joly Spark Plug. 5,000,000 were Required.

This chunky, sturdy plug stood strong for from 70 to 80 hours in the thousands of high compression motors under sustained speed. The airplane engine never idles---never slows down. The land motor gives its plugs a cooling chance.

Consider this splendid record, then ask yourself the question: "What is such a Plug worth to my trade—what is it worth in the building of my business?

There is but one answer: The Joly **Spark Plug will outsell any other Plug on its record alone.**



Why It Cannot Fail

The heavy, integral fingers furnish ample heat radiation. Pre-ignition from plug cause is impossible.
The plug is oversized—breakage is practically impossible. Design of electrode operature allows for no leakage. Insulation is perfect, making short circuit practically impossible.
In every way it is rendering the same car, truck and tractor superservice that made it supreme in the air.

TO THE TRADE—

Aside from selling a plug that knocks the plug grouch **out of your trade, we have a discount proposition that you won't pass up—write today.**

LYONS IGNITION CO.
215-19 Fourth Ave., New York
Factory, Paterson, N. J.

IMPORTANT—Do not tie yourself up on any spark plug contract until you have investigated the Joly Spark Plug and the sales plans back of it.

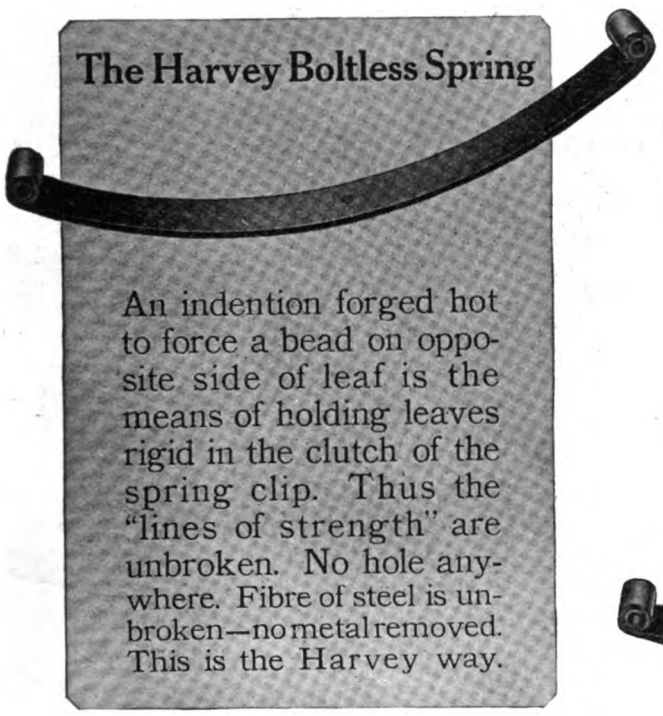
Unbroken Lines of Strength in the Harvey Boltless Spring



TWO methods were employed to make the Harvey Spring excel in strength so that a broad guarantee could be offered safely with every sale. The center hole was eliminated so there are no weak spots. Then the Harvey patented process of heat treating and tempering was solved. These two factors have made the Harvey known in motordom as a spring in which the motorist can place utmost confidence.

Dealers are invited to write for the Harvey book containing specifications for over 1000 kinds of Harvey Springs; also for information regarding our dealer co-operation.

Harvey Spring & Forging Co.
1161-17th Street Racine, Wis.

No longer need automobile spring sales mean added responsibility and eventual trouble for the dealer. He can sell the Harvey Boltless Spring with a guarantee that really protects. Also he can assure resilience that gives the motor car extreme riding ease and eliminates the jolts that wear down tires and mechanism prematurely.

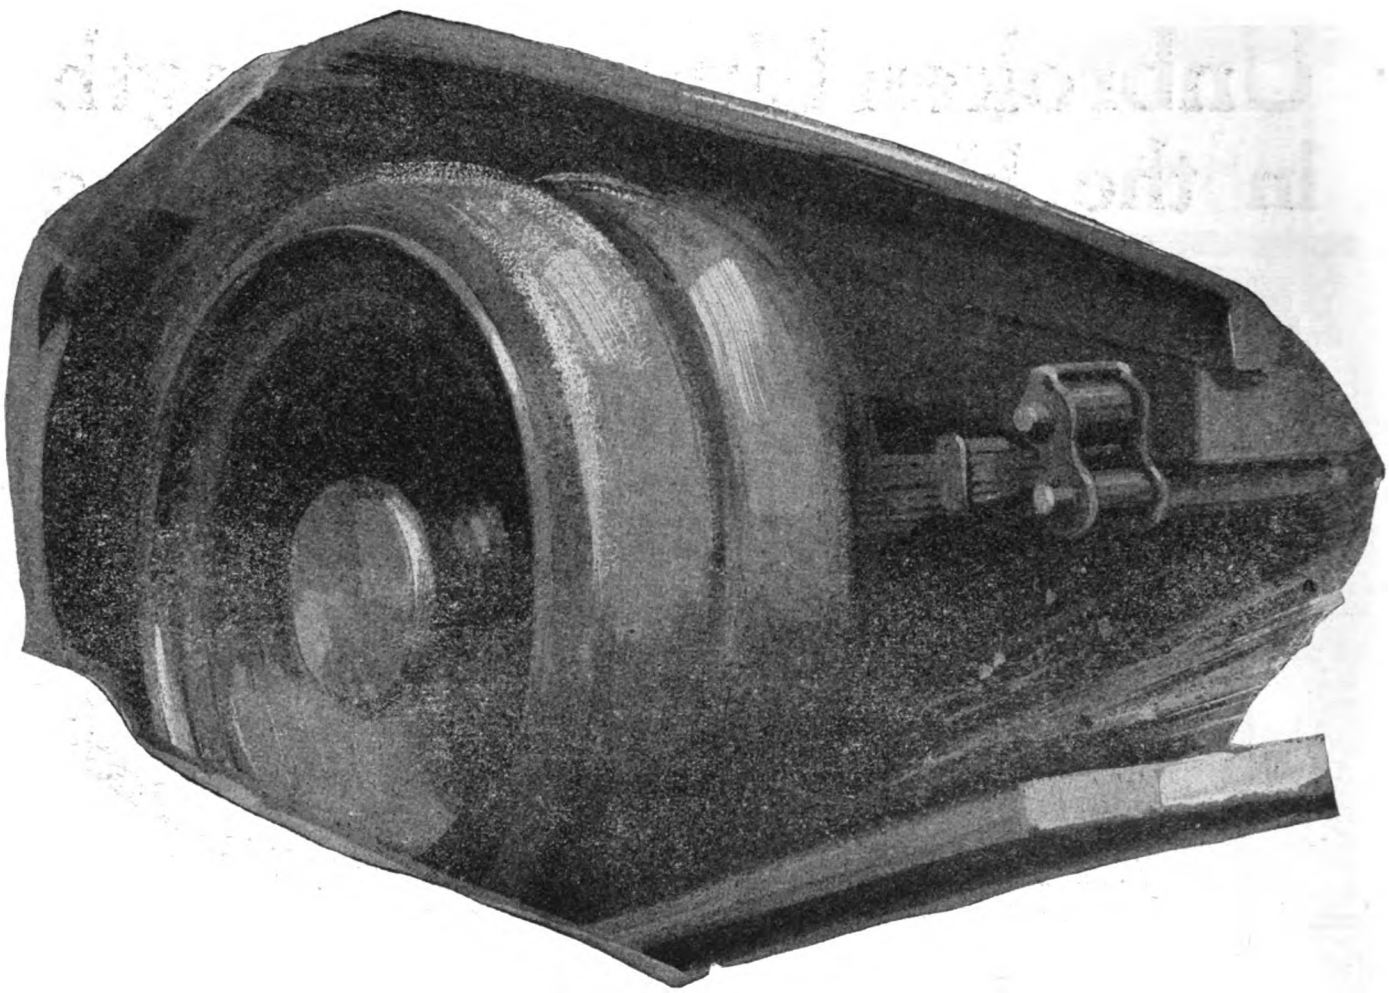
Powrlok in the Rear Axle



Stops Stalling

Powrlok actually does stop stalling and prevents skidding, because it automatically distributes the power to the rear wheels the logical way—in direct proportion to the traction or hold which the wheel has on the ground—instead of in indirect proportion as the ordinary differential does.

It supplies the power to the wheel that can use it instead of giving it to the wheel that wastes it in useless spinning.

Even conservative automobile engineers class it as one of the three or four greatest improvements made in motor cars within a decade. This is best proven by the fact that fifty manufacturers of all classes of automotive vehicles—passenger cars, trucks, tractors and industrial trucks—now use it as standard equipment.

Write for our new booklet entitled—"More Than a Differential."

Specify Powrlok when you buy.

FRONT APRON FOR FORD CARS

For 1917-18-19-20 Models Only.

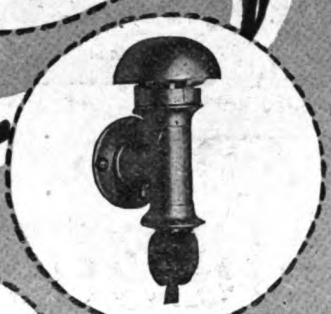
This apron makes a wonderful improvement in the appearance of the Ford Car, and for that reason alone is worth the cost, but it does more than that.

Induces a Larger Volume of Air to Pass Through Radiator.
Prevents Mud from Clogging Radiator.
Reduces Risk of Overheating.
Keeps Lamps Clean.
Prevents Vibration of Mud Guards.

Made of heavy steel, finished with two coats black enamel and baked. Furnished complete with bolts, nuts and washers. Easy to attach.

PRICE $6.50

$7.50 West of Mississippi River.



"TUWAY" COMBINATION DASH LAMP and PLUG SOCKET

The "TUWAY" dash lamp affords a combination of refinement and utility. Its pleasing design makes it an ornament to any car, and this design has the added advantage of giving a greater distribution of light from the same candle power bulb than any other lamp made. In addition it has the exclusive feature of a socket into which to plug trouble lamp, cigar lighter, etc., without interfering in any way with the light of dash lamp. The switch is very conveniently placed in the lamp bracket.

The Tuway is made of brass heavily nickel plated and comes complete with bulb and all necessary screws, bolts and nuts for attaching to either wood or metal dash.

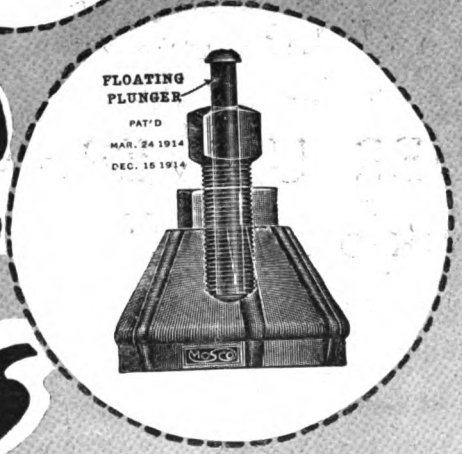
PRICE, $2.50 EACH.

IMPROVED BEMUS BALL CONTACT TIMER FOR FORD CARS

EASIER STARTING—SMOOTHER RUNNING—
LONGER LIFE—SAVES COIL POINTS.

The IDEAL TIMER for the FORD high speed, short stroke engine because form contact is the only one which is correct both electrically and mechanically. This is made by a hardened tool-steel brush coming in contact with steel balls, which are kept in proper position by means of a spring with plug on the end pressing against them. The impact of the brush causes the balls to turn so that a fresh surface is presented for each contact. The brush comes in contact only with the four balls, touching no fibre or insulation. This is a decided improvement over the ordinary type timer, where the roller is constantly wearing grooves in fibre ring which holds contacts. The balls are so located that each has a track of its own on the brush, this insuring a maximum amount of wear.

PRICE, $3.00.



FLOATING PLUNGER WHEEL PULLER

Starts a "Frozen" or "Stuck" wheel instantly. Strike the plunger, turn the screw, strike again and the wheel comes off without injury to hub threads, spokes or axle.

Made for 200 models of 45 popular makes of cars.

Automotive (MOSCO) Equipment

DEPENDABLE PRODUCTS

BEAMOLITE SPOTLIGHT

"Built for those who demand the best."

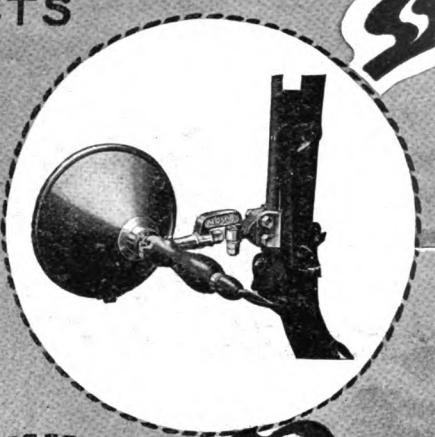
A custom made, quality equipment, strongly constructed, giving a powerful light—a light that lends dignity to any car.

The bracket is of Universal type, made from non-rusting metal, heavily nickel plated and so designed and made that it "stays put" in any position.

The reflector is made of brass, silver plated, on nickel, and highly finished. It affords maximum lighting effect and can be thrown in any direction (even backward).

It can be easily and quickly removed from the bracket when there is need of a trouble lamp. The bulb can be quickly replaced by removing the rim screw.

PRICE $15.00

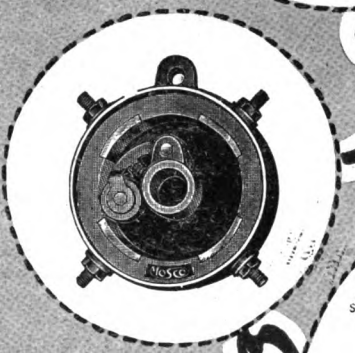


MOSCO TIMER FOR FORD CAR

Case is made of extra heavy pressed steel, finished in aluminum. Gray bone fibre raceway with steel inserts dovetailed in. The threaded terminals are insulated by fibre washers through to contact points, thus removing cause of short circuiting.

PRICE, $1.50.

(Complete with brush.)



JIFFY BUSHING REMOVER

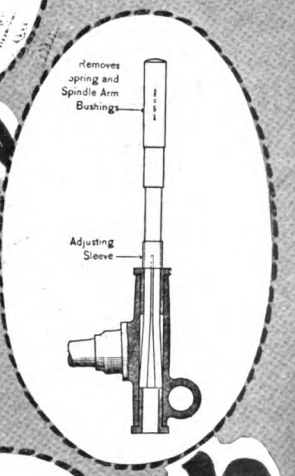
For Ford, Dodge, Dort, Chevrolet, Saxon, Overland and all Cars, Trucks and Tractors having ½" spindle bolt.

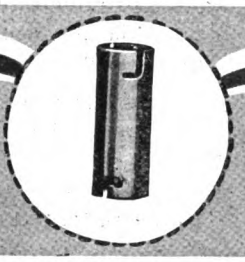
Made of steel, case hardened.

Indispensable to repairman and owner who does his own work. Pays for itself in a few minutes.

The only tool now in use that will remove steering knuckle, spindle arm and spring bushings.

PRICE, $1.50.





Electrical Fittings and Equipment

In the manufacture of "Mosco" Sockets the tubing is swedged on. This eliminates all chance of the plug turning in the socket—a most common cause of trouble when ordinary methods are used. Our inspection and testing in the course of production insures perfect goods and the correct shipments made.

All "Mosco" electrical fittings are guaranteed not to "short circuit" or deteriorate in use of current up to 20 amperes and to afford every satisfaction. With modern machinery and all time and labor saving equipment "Mosco" fittings are turned out in great volume and insures prompt service and delivery.

A "Hot Tip" on How to Save Money

Here, at last, is a quick, simple and inexpensive way to do lead burning and soldering work about the garage without gas tanks and other elaborate equipment.

Pyrotip, the G-E Electric Lead Burner

For overhauling and repairing lead storage batteries:

For removing straps to disassemble battery. Hot point of the carbon quickly softens joints, so that they can be pried off in less time and with less effort than by the usual brace and drill method.

In removing battery from car:

Corroded connections which cannot be separated in the usual way can be very quickly unsoldered by the use of the electric lead burner. It is portable and work on the battery can be done in the car.

To build up posts

The sharp tip of the carbon can be easily inserted in the ferrule or asbestos without danger of burning the post loose from the battery. Can be worked into corners and any dirt not cleaned off the post floats to the top as slag.

For building up lugs on plates and assembling plates in groups:

Lugs on plates may be lengthened or cut off quickly. Plates can be assembled in groups very readily using Pyrotip.

To burn on cell-to-cell connectors:

Concentration of the heat at the point of carbon reduces danger of melting sides of joint. Joints are made in less time with Pyrotip.

For other applications:

Many other applications, such as soldering splices, sweating on terminals, small brazing jobs, cutting thin sheet metal and similar uses will occur to the operator. Pyrotip will be found to be a very convenient tool.

BLUE RIBBON PRODUCTS

Are a Standard Line

Jobbers and Dealers stock the full Blue Ribbon line as they do all other tried, proven and constantly selling goods.

Blue Ribbon products are made by specialists who depend wholly on the quality and service giving satisfaction afforded by lines bearing their trade mark.

There can be no experimentation at the expense of the consumer, dealer or jobber. All Blue Ribbon Specialties must be as good as they are practical in every day use as it is possible to make them.

A nation wide trade, enormous expenditures devoted to development and promotion work as well as the maintenance and operation of the largest plant of the kind in America is too great a stake to gamble against quality.

Blue Ribbon Products today stand supreme. They are passed over the counters backed by an unqualified guarantee on the part of the trade that can leave no doubt as to their merits.

That is why Blue Ribbon Products are a standard line and will always continue to be so.

That is why all jobbers and dealers sell and list them in their catalogues.

Above all else that is why the consumer buys Blue Ribbon trade marked products. Blue Ribbon Products cost no more than others, yet represent the most profitable line that can be placed by the jobber or dealer.

If the **BLUE RIBBON** trade mark is to be seen on your shelves or counter you have a silent salesman in your store that is always working, always earning.

All Blue Ribbon Specialties are sold in quantities to meet any requirement.

The full line affords a complete line and it pays to specialize in known quality goods.

Blue Ribbon Specialties Include:

Blue Ribbon Cold Cream Hand Soap
Contains no pumice or sand.

Blue Ribbon Leak Proof Cement
A permanent radiator cement.

Blue Ribbon Nickel Polish
For nickel parts and trimmings.

Blue Ribbon Auto Body Gloss
For automobile or furniture.

Blue Ribbon Lightning Carbon Remover
Quick and positive in action.

Blue Ribbon Black Enamel
For lamps, hoods, radiators and metal parts.

Blue Ribbon Auto Top and Seat Dressing
A waterproof dressing that restores tops and seats.

Blue Ribbon Hand-On Patch
A self-vulcanizing patch for shoes and tubes that never fails.

Blue Ribbon Cream Metal Polish
For any metal. An easy, quick working, satisfactory polish.

Blue Ribbon Oil Soap
A pure vegetable oil soap for any purpose. All quality and efficient.

This is the time to consider your winter and spring requirements

GUARANTY Motor Repair Arm

(Pat. No. 1,289,100, December 31, 1918)
Note the date.

"Scientifically made in Rights and Lefts, extended prongs providing greatest bearing surface and strength reinforcement. Saves time and expense. A wrench and a few minutes make a permanent repair. Loosen 6 bolts, tighten nuts, don't disturb motor."

Price $1.50

GUARANTY SPARK INTENSIFIER

WHICH EXPLODES ALL GAS IN EACH CYLINDER AND MAKES THE PLUG FIRE EVEN IF DEFECTIVE AND CYLINDER THROWS OIL BY JUMPING THE SPARK, MAKING IT HOTTER AND ABSOLUTELY EVEN.

(The Jump-Spark is the most powerful electricity knows.)

GREATLY ADDS TO MILEAGE, MOTOR POWER, SPARK PLUG LIFE AND EFFICIENCY.

Easy starting—Prevents Carbon—No free gas to accumulate in cylinders or throw off through exhaust—Instantly locates source of trouble in case of broken wire, defective coil or timer. Pure Mica enclosed, eliminating all possibility of hazard. Of great value to all autos and trucks, whether Battery, Generator or Magneto.

Box of 4, $2.50. Box of 6, $3.75. Single, 75c.

CRONK SIMPLEX SLIDING GEAR TRANSMISSION for FORDS

A Three-Speed Forward, One Reverse Selective Type Sliding Gear Transmission

This is a new development—a radical refinement of a most practical character—and so it is well worth investigating.

Here we do away with the planetary, with its bands that wear out—that "drag back" on engine power and retard coasting freedom.

We relieve the Ford owner from the mean necessity of using either the low or high gear when conditions call for a better combination of power and speed.

The Cronk Transmission for Fords is a real transmission. It will stand up. Hills and rough roads that heat and wear a planetary transmission on "low" or strain the engine on high, are taken much more easily and efficiently on "second"—and at from 10 to 20 miles per hour at that.

You show a Ford owner this wonderful three-speed transmission. Let him handle the simple "cane shift" in low, intermediate, high and reverse. Show him why he won't have to longer hold down the clutch pedal with his foot for weary miles. Tell him that he doesn't have to court accident by taking bad hills at a high speed. Show him more speed at less expense of fuel.

The Cronk Simplex Transmission for Fords gives the engine its fullest expression of power, flexibility, speed and economy. It gives the driver the same control used on higher powered cars in general.

Foot brake on jack shaft back of transmission is free from oil and radiates heat perfectly. Raybestos lined. No cotton lint to foul spark plug or clog oil tubes.

Design allows for installation of electric starter on old cars in same manner at 1920 cars.

This transmission is a rugged job—oversized nickel steel gears. Can be installed and forgotten so far as future trouble is concerned.

Saves rear axles by eliminating jerks they receive in dropping from low to high. Installation easy—no cutting or machining—just an assembly job.

DEALERS—When you get the full story on this transmission the selling possibilities in your territory will become large. Our arrangements with you are made direct and your additional profit on original Ford parts removed is also a big item. Write or wire.

Write for our exclusive State rights distribution proposition. We are looking for men of vision and action.

E. D. & A. F. CRONK, Inc.
Utica, New York

Our state rights distribution proposition offers a profitable and growing business future to men who are accustomed to swinging big things—you may be the man for your state. Write or wire.

Ohio Auto Trades Adopt Resolutions

The Ohio Automobile Trades' association at the recent convention at Cleveland, O., passed resolutions in favor of the Motor Vehicle Tax Bill pending in the Ohio General Assembly and urging that automotive interests give it sanction and support, provided the funds derived therefrom are properly safeguarded and are used for the mandatory maintenance of state and county improved roads; indorsing the Pittman bill as fostered by the National Automobile Dealers' association also as follows:

"Whereas, our state and nation are today facing a general unrest in the labor situation, and, whereas, there is a serious shortage of production in almost every line of activity, and, whereas, America today is facing a famine of needed production of food, clothing, fuel and other commodities, now, therefore, be it resolved, that the Ohio Automobile Trade association, in convention assembled, do protest against the tendency of shortening the work day and that we favor working more hours per day."

The following officers were elected: President, Andrew Auble, Akron; vice presidents, Frank J. Girard, Columbus, and Warren E. Griffith of Toledo; treasurer, F. E. Avery; manager, Victor Moon, Columbus.

The Lehigh Automobile Trade Association was recently formed at an enthusiastic meeting at Easton, Pa. Plans for progress were made on a somewhat elaborate scale. The purchase of property at Rittersville was approved and a contract awarded for the erection of an auditorium. The association was incorporated Oct. 2 with $50,000 capitalization. Its purpose is to hold exhibitions of motor vehicles, supplies and accessories, to buy, sell and manufacture the same, to hold real estate for these purposes and to afford mutual protection to the members and the public. Land for the auditorium was purchased for $15,000. The building will cost $75,000. The following officers were elected to serve until April: President, E. T. Satchell; vice president, E. A. Krause; treasurer, W. F. Wink; recording secretary, A. P. W. Brooks; financial secretary, W. O. Messinger.

ACCESSORY ASSOCIATION ELECTS.

The Automobile Accessories Business association of Philadelphia has elected the following officers: President, W. H. Metcalf; vice president, George L. Fischer; treasurer, N. A. Petry; secretary, A. W. Stellwag; two-year directors, H. E. Alimang; George B. Shearer, Jr.; one-year directors, W. T. Bosworth, T. S. Eavenson, C. B. Vogt, W. R. Walton, C. H. Waltz.

There are now more than 200 members on the membership rolls, this being double what it was a year ago

At the December smoker there were about 350 accessory men present and it was reported that 49 new applications for membership had been secured. The total membership is now nearly 300, about three times what it was a year ago, and is made up of manufacturers and jobbers of automobile accessories, dealers and their salesmen.

Mr. Metcalf, who is connected with the service department of the Wire Wheel Corporation of America, successor to the George W. Houk Co., is serving as president for the third term. The affairs of the association are controlled by a board of governors consisting of the four officers and seven directors.

W. H. Metcalf, President Philadelphia Automobile Business Association.

Portland Association's New Plan

At the annual meeting of the Portland Garage and Repairmen's association the new plan of organization was unanimously approved and put into effect. This is, briefly, as follows:

In place of the former board of managers composed of the five officers of the association (president, two vice presidents, secretary and treasurer), there has been substituted a board of trustees composed of the above officers, and in addition four trustees, all elected by members at the annual meeting. The trustees will hereafter be elected for two-year terms and the officers for one year. This board of trustees will be the governing body of the association. In addition to these officials there have been created and elected under the new plan six vice presidents, representing as many different crafts or departments included in the association membership, these being divided as follows: Battery and electrical shops, garages, machine and repair shops, tire repairing shops, paint and trimming shops and auto sheet metal and wheel shops.

But perhaps the most important part of the plan is the creation of the new office of business manager, who will be in effect an assistant secretary, to be appointed by and work directly under the board of trustees, subject to its advice and approval. This business manager will devote his entire time to conducting the affairs of the association and will be paid a salary. Among his important duties will be the management and editing of the Association News, the monthly publication issued in its interests.

Eighteen new members were admitted at the last meeting.

MONTANA DISTRIBUTORS' SHOW.

The Montana Automobile Distributors' association will hold its fifth annual automobile show at Great Falls, Montana, March 15-20.

A Motor Style show, the first to be held in the northwest, will be held in conjunction with this automobile show, and promises to be a novel and interesting feature.

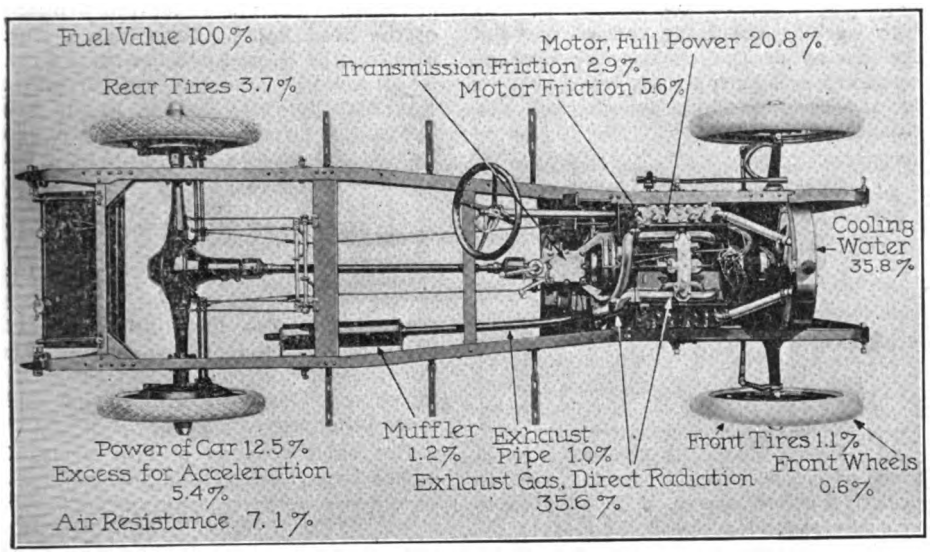
What Becomes of Fuel and What Reserve is Left for Unusual Demands



Illustrating Percentage of Useful Work Realized from Given Volume of Fuel Expressed in Thermal Units.

MOST owners of automobile vehicles are interested in the fuel they buy and with rare exceptions they assume to know what is referred to as average consumption. That is, they will state positively that they can drive a specific number of miles with a single gallon of gasoline. Some will boast of assumed small consumption, just as others will complain of what is regarded as extremely small mileage.

As a matter of fact there is no standard by which consumption can be measured other than comparison of what is obtained by owners of cars of the same make and capacity, and even then much depends upon the owner or driver. One man may be very well experienced, driving with the least fuel necessary, and another may drive with no knowledge of fuel conservation. The judgment of the drivers is not the ordinary basis for determination—the one using the largest volume of fuel criticises the vehicle and believes himself right from every point of view.

The internal explosion engine is not generally more efficient than the steam engine so far as the realization of power from fuel consumed is concerned. Tests of engines in laboratory determinations have proven that operated by experts they will be more efficient from some angles, but this efficiency will reduce gradually until restoration by adjustment or overhauling is necessary, and taking the average, and considering the experience and judgment of those operating them, there can be no reason to claim material economy in fuel value.

Thermal Value of Fuel.

The thermal value realized from coal in the steam boiler depends upon the design of the boiler, the quality of the coal and the judgment of the engineer or fireman. The thermal value realized from gasoline depends upon the quality of fuel, the degree of carburetion and the condition of the engine.

The most economical use of fuel is when it is so carbureted that it will be entirely consumed. There is a wide range of proportions of gasoline vapor and air that are combustible, but unless these two elements are mixed so they burn practically without residue, the full value of the fuel is not obtained, and this is reflected by reduced power or large consumption or both. As the gasoline is supplied through a carburetor the instrument must be set or adjusted, and this setting depends upon the quality of fuel, the temperature, the lubrication and condition of the engine and the efficiency of the electrical ignition apparatus.

Carburetor Adjustment Important.

The adjustment of the carburetor is a very delicate operation—in fact, far more delicate than is believed. This work is practically a matter of judgment, for the worker must determine just the point when the engine is doing its best, and this must be done when the machine is standing either in the garage or on the road. As the efficiency of the cooling system will improve with the movement of the vehicle the determination while standing may not be specially efficient when moving, for the temperature may be considerably reduced, and any stop will cause the engine to heat and the precise setting that will be best while driving is rarely obtained.

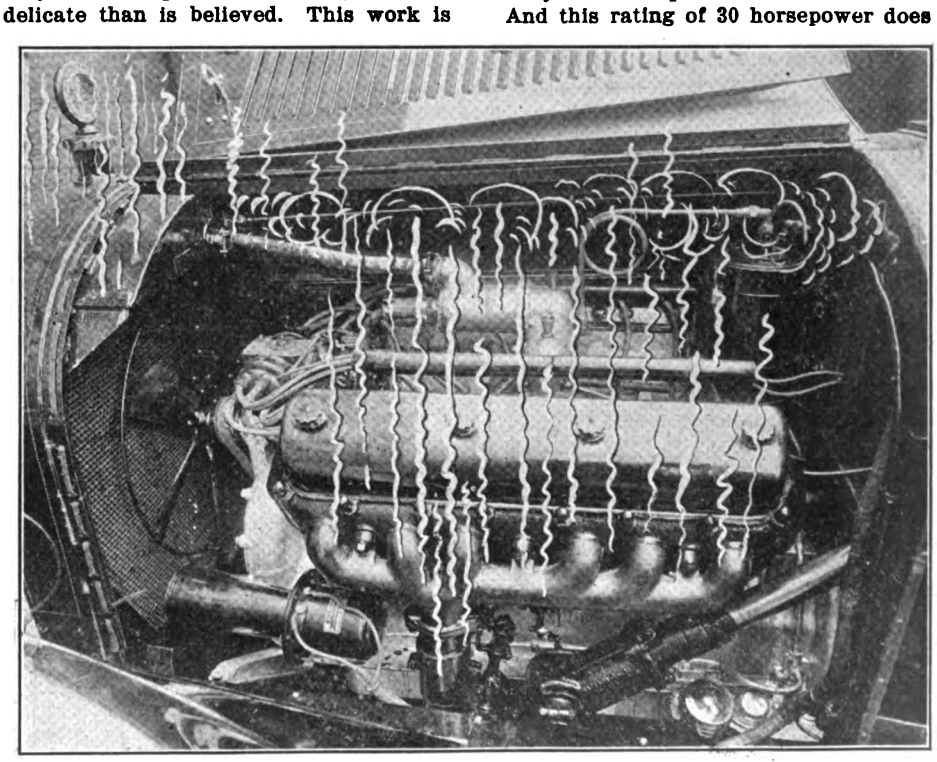
The ignition system will be a potent factor, and this will include every element from magneto or timer or distributor to the spark plugs. Each of these must be operative to the standard of efficiency. The engine has been assumed to be in normal condition, but the lubricant will be more effectively distributed if the machine has been heated, and this in turn is influenced by the cooling system. If the valves leak, air is admitted through the manifolds, the spark plugs, the valve caps, or the fuel is diluted in any way; if the lubricating system is defective, if the engine is worn and there is lost motion and excessive friction, the power output is more or less reduced.

How Engine Power is Determined.

The owner or driver may be impressed with the efficiency of an engine which, for the purpose of illustration, may be assumed to develop 30 horsepower at maximum by brake test, which is the best indication obtainable. He does not understand that the test is made with the engine out of the chassis. The power appears much in excess of any ordinary requirement.

Yet to obtain this 30 horsepower fuel is consumed that, were its entire thermal value realized, would develop approximately 150 horsepower.

And this rating of 30 horsepower does



Showing Power Plant (Direct Radiation) Cooling System (Indirect Radiation.)

Digitized by Google

not mean 30 horsepower available for useful work; that is, delivered in actual tractive effort at the road wheels. The power actually delivered is approximately one-eighth of the thermal value of the fuel consumed.

This leaves as available for useful work at the road wheels but 12.5 per cent. of the thermal value of the fuel. This is approximately 18.75 horsepower. The resistance of the air against which the vehicle must be driven requires no less than 7.1 per cent. of the total fuel value, or really 56.8 of the actual car power, and this leaves 5.4 per cent. of the total fuel value, or 43.2 of the actual car power for acceleration, climbing hills, driving through soft surfaces, etc.

The Various Causes of Power Loss.

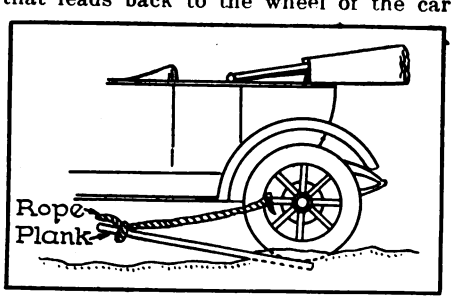
Assuming a thermal value of a gallon of fuel as 100 the losses, as determined by extremely careful experiments, are the following, expressed in terms of percentage:

Engine friction	5.6	
Cooling system (indirect radiation)	35.8	
Direct radiation, exhaust, etc.	35.6	
Exhaust pipe	1.0	
Muffler	1.2	
Loss in the engine	79.2	79.2
Power transmission system friction	2.9	
Rear tire adhesion or friction	3.7	
Front tire friction	1.1	
Front wheel friction	0.6	
Loss in transmission to road wheels	8.3	8.3
Total loss in engine and transmission		87.5

By this one realizes that of the gallon of gasoline consumed in the engine a very small part is converted into useful work. But even this value may be materially lessened by neglect that will reduce engine efficiency.

PULLING CAR OUT OF MUD.

A motorist called attention recently to a kink for getting a stalled car out of mud. A plank several feet long and six or eight inches wide is shoved under the wheel as far as possible. To the outside end of the plank is fastened a rope that leads back to the wheel of the car



and is secured around one of the spokes of the wheel. When the car is started the rope will hold the plank in place and pull the car on to it as the wheel moves forward. With a very long plank the outer end might need to be steadied to prevent the wheel running off into the mud again. The operation can be repeated as often as necessary till the car reaches solid ground, the rope being untied and the plank being placed in a new position each time.

Brief Mechanical Hints and Suggestions

SCREW DRIVER KINKS..

In working about the various parts of the engine or the chassis the average repairer needs such suggestions as shown for the easy manipulation of small machine screws.

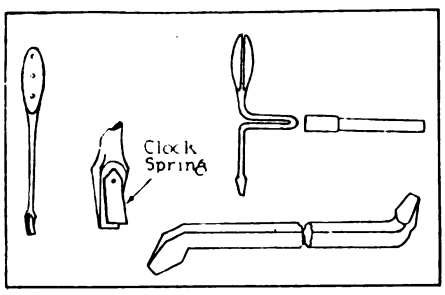


Fig. 1 shows how by riveting a short piece of clock spring to the blade of an ordinary screw driver, it is adapted to grip the slotted screw holding it to the end of the driver and enabling the repairer to reach into inaccessible places and to start a screw that would be troublesome to remove otherwise.

Fig. 2 illustrates a very practical way of applying additional leverage to a screw driver. A long handled screw driver is used for the purpose, the handle being bent to the shape of a short crank, and on the arm thus formed a piece of piping is used to supply the leverage for starting stiff screws.

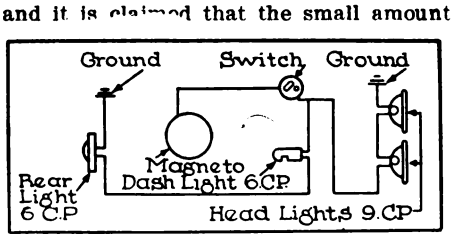
Fig. 3 shows a very useful angle screw driver by which screws may be reached in close quarters where a long handle straight screw driver could not be used.

MUD AND BRAKES.

Many times the motorist after driving over rough, muddy roads, finds that his brakes are stiff and refuse to work properly. This is because the mud has worked into the joints of the brake mechanism and on to the brake lining, affecting their operation. These parts cannot be properly cleaned by wiping with a cloth or washing off with a hose. The operator will get the best results by dismantling the brake mechanism and thoroughly cleaning it, then thoroughly lubricating the joints and removing all loose dirt from the brake bands with a stiff brush or by washing. This will prevent rusting of the parts.

WIRING SYSTEM FOR FORD DASH AND TAIL LIGHT.

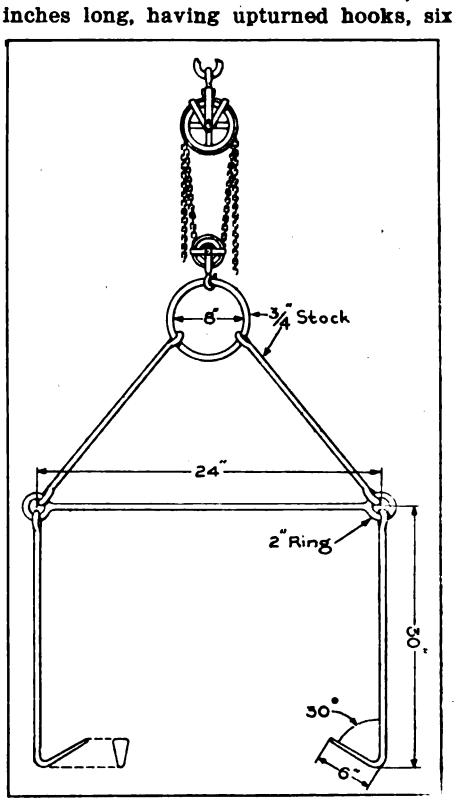
The accompanying illustration clearly shows the method of wiring a dash and tail light to the Ford car, without interfering with the regular lighting system. Six-volt, two candlepower lamps are used and it is claimed that the small amount of power taken from the regular supply of current will not affect the brilliancy of the head lights. Note that a single point switch is used and the extra circuit is attached beyond the switch, on the main lighting wire leading to the head lights, the circuit being grounded after leaving the rear or tail light, with both lights in series as with the head lights.



FORD CAR HOIST HOOKS.

A handy car hoist for the Ford service station can be made by the shop mechanic in a few hours time that will prove invaluable in lifting engines from the chassis, the front end of cars when replacing springs or can be used in numerous other ways.

The hoist consists of two arms, 30 inches long, having upturned hooks, six



inches long, flattened at the end, attached to a cross bar at the upper ends by welded eyes, the cross bar being 24 inches in length and attached by iron rods about 20 inches long to an eight-inch ring by welded eyes. All stock should be ¾ inch round iron and the eyes two inches in diameter. Hooks at the bottom of the side rods are set in at a 30-degree angle, insuring a firm hold on the engine or car frame. The side rods may be offset so as to pass around the fenders of the car and still give a direct lift. The device is to be used with a chain fall in the regular way and is light enough to be easily handled by one man.

WHEN NOT TO USE A REAMER.

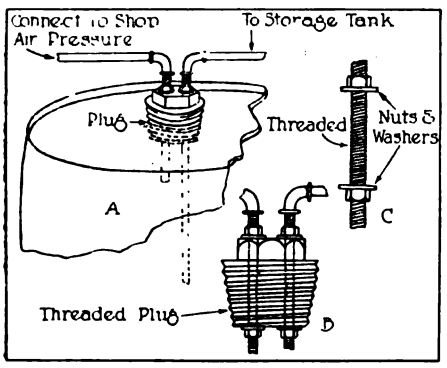
Never use a reamer on the inside of a pipe. The scale inside a pipe, caused by the flux used in welding or brazing, is as hard as glass and will turn the edge of any reamer.

Digitized by Google

For the Repair Shop and Garageman

TRANSFERRING OIL TO STORAGE TANK.

A convenient method for transferring oil from barrels to the shop storage tank is by making use of air pressure. All that is required is a special bung and

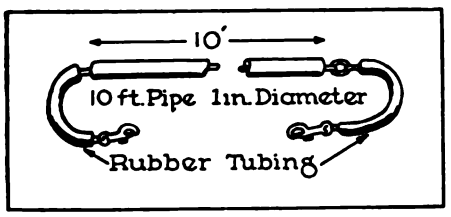


two lengths of pipe ¼ inch in diameter, threaded where they pass through the bung and fastened to it with a nut and washer at the top and bottom. The bung should be of good size, large enough to admit the piping and allow for tightening the nuts against the washers.

Stand the barrel on end, bore a hole in the head to receive the bung which, by the way should have a coarse thread, and screw the bung into the head of the barrel. Connect the air pressure to the shortest pipes. The other pipe should be of sufficient length to reach the bottom of the barrel and should be joined to the oil storage tank. Turn on the air, using only sufficient pressure to force the oil into the storage tank in a solid stream. This device will empty a barrel of oil in a few minutes time.

HANDY TOWING DEVICE.

A handy towing device for the shop is made from a 10-foot length of iron pipe either ¾ inch or one inch in diameter, through which a chain is drawn. The



ends of the chain are covered with rubber tubing, pieces of old hose will do. Snaps are fastened to the ends of the chain and the towing device is ready for service. When using the device, place one end of the chain around the hook end of the frame and the spring on the towed car so that the rubber tubing will press against the painted surface, and fasten the spring snap into a link of the chain near the end of the iron pipe. Pass the other end around the axle of the towing car in the same manner. The object of the iron pipe is to space the distance between the cars, so that accidents cannot occur from the towed car running up too close to the towing car.

USE OF THE SPARK LEVER.

In the pioneer days of motoring drivers prided themselves on their skill in manipulating the spark lever, but the tendency today is to give it too little attention.

The driver who leaves the spark lever fully advanced irrespective of grades, road conditions and speeds, imposes unnecessary strain on the engine and does not get the efficiency he should in car performance. It pays to regulate the spark to suit the load and speed of the engine, so that the ignition does not take place either too early or too late for smooth running and steady flow of power.

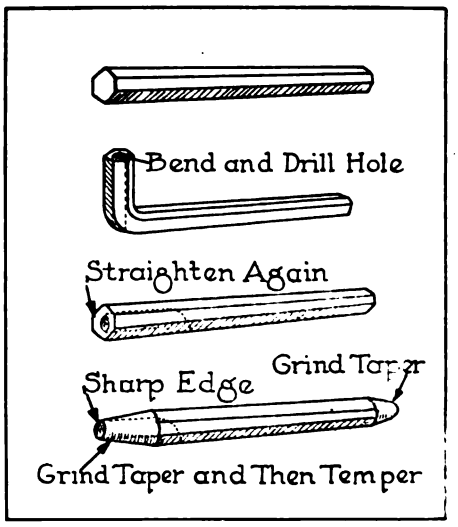
The best method for the beginner to pursue is to keep the spark lever retarded sufficiently to avoid the slight knock in the engine, which is sure to develop if the spark is too far advanced when accelerating from slow car speed in high gear; then advance the spark gradually as speed increases. A few experiments will soon develop the best position.

TO FILL BLOW HOLES.

To fill blow holes in cast iron, take one part of red lead and 1½ parts red litharge and mix with glycerine to the consistency desired.

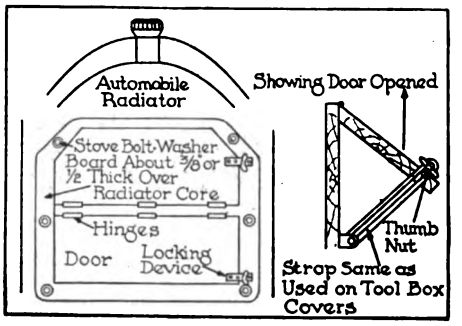
MAKING A SMALL LEATHER PUNCH.

The repairer will want to make his own tools from time to time and the following directions for making a small leather punch may be utilized, as well for making punches of larger sizes. Take a piece of steel about six inches in length, hexagonally shaped if possible, as that is the easiest form to hold when working. Heat one end in a forge and bend at a right angle. Drill a small hole, the size required, as shown in the dotted line, from the end of the rod down and through the bend. Straighten the rod again in the forge and grind the end to a tapered cutting edge and temper. Taper and flatten the upper end. Larger punches may be made by using stock of a larger size.



RADIATOR SHIELD.

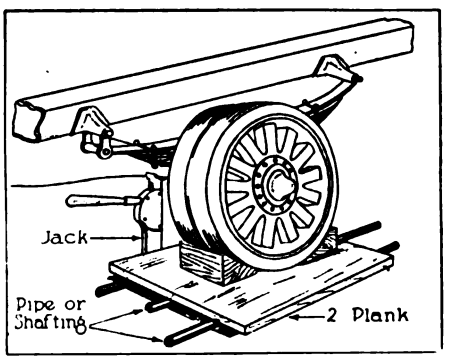
A radiator shield that will answer every purpose during cold weather may be made by the motorist who is handy with tools, from thin boards, as follows: Procure from the hardware store six



stove bolts of the correct length to pass through the radiator core and the board or frame work, or curtain material may be used instead of the board if desired, in which case a frame of wood fitting the radiator is required. Make the frame as shown in the illustration, leaving space for the doors, to be hinged at the center, using three hinges for each door. The doors are held in the open position by slotted arms and bolts having wing nuts, similar to those used on carpenter tool boxes to hold the cover up. The shield is fastened to the radiator frame by boring holes through the cover frame and fastening with the stove bolts. Doors may be made of wood or a frame covered with curtain material as desired.

REMOVING MOTOR TRUCK WHEELS.

A simple device for removing motor truck wheels of the dual type and especially serviceable where one man has to do the work, is made from a two-inch plank, cut to the desired length and width. Jack up the wheel several inches from the floor, lay four rollers, made from either iron pipe or old shafting, on



the floor beneath the wheel, place the plank on top of them and chock the wheel at each side. After the wheel has been loosened on its axle it can be easily adjusted on the movable platform for further work.

The amateur mechanic is often puzzled in removing a dent from a tank. Solder a tire valve to the filler cap and pump air into the tank, meanwhile tapping lightly around the edges of the dent with a leather mallet. The pressure of the air in the tank will push the dent out even with the rest of the surface.

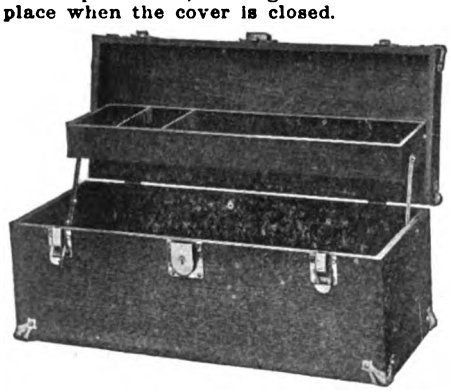
ACCESSORIES, EQUIPMENT AND TOOLS FOR THE GARAGE AND REPAIR SHOP

Union Tool Chests are made for a discriminating service station trade that requires the best. The frame is made from thoroughly kiln-dried oak, all joints lock-cornered, with the top of cover and bottom of chest rabbited in, glued and nailed. The trays are automatically raised or lowered by special hinged fittings, are provided with removable partitions and are constructed with all joints rabbited and glued. When closed the tray fits flush with top of chest, holding the contents in place when the cover is closed.



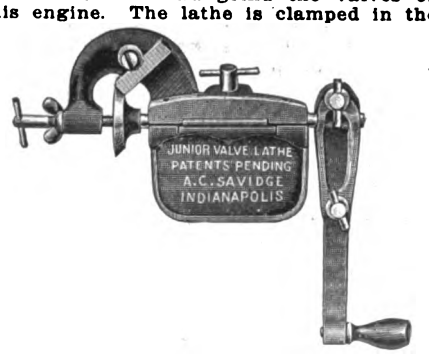
The chest is provided with a genuine leathered covered handle, over a steel core, attached to nickel-steel loops by cotter pins, the loops being riveted to the cover of the chest. All trimmings are heavy, nickeled and polished, including top loop fasteners and specially built 12-key change lock supplied with two flat, milled slot keys.

The tool chest is finished inside with a dark oak stain and outside in golden oak, filled, stained, primed and varnished with a high grade, waterproof varnish, dull finish.

The chests may also be supplied with leather covers, the construction being the same as the plain wooden chest, being covered with the best grade of imitation leather, which is water proof.

Manufactured by the Union Tool Chest Co., Rochester, N. Y. Prices on request.

The Junior Valve Lathe for Ford Engine Valves is designed for the motorist who wishes to true and grind the valves of his engine. The lathe is clamped in the vise and operated with the turning handle, or may be held with one hand while being turned by the other.



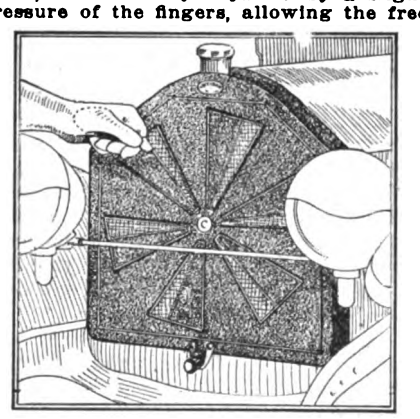
The Junior lathe is constructed from the best of iron and steel and is finished in gray, nickel plated. It is equipped with an adjusting screw and wing nut gauging the pressure exerted on the head of the valve and holding it against the cutting tool. It is designed especially for cast iron head valves up to 1¾ inches in diameter and with 5/16-inch stems.

The Junior valve lathe makes an ideal equipment for Ford repair shops and service stations.

Manufactured by A. C. Savidge Co., Indianapolis, Ind. Price, $5. Extra cutter, $1.

"Antidam" Heat Retaining Radiator Cover is a heavily padded radiator cover having a patented adjustable feature that makes it a desirable radiator for the motorist who is obliged to use his car during the winter months.

The adjusting feature is formed similar to a cooling fan, fitting in the front of the cover, and is easily adjusted by a slight pressure of the fingers, allowing the free



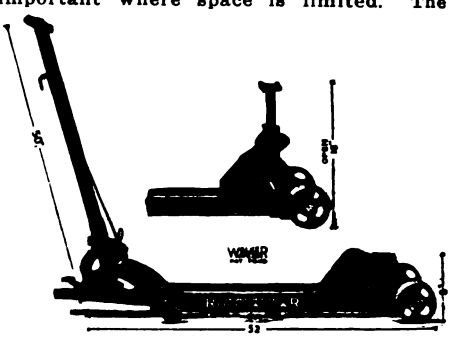
circulation of air through the sections of the radiator core during warm days and may be partially closed during extreme cold weather.

Antidam Radiator Covers are made of the best of material obtainable and heavily padded to keep out the cold and keep in the heat of the engine. Made in sizes to fit any model radiator.

Manufactured by the Glover Equipment Co., 412 Capitol Boulevard, Indianapolis, Ind. Prices, $6 to $8. Sold by dealers everywhere.

The Walker Roll-A-Car Jack consists of a lift jack mounted on a steel frame, having fixed rollers at the jack end and castor rollers at the rear. A long upright handle is fastened at the rear by which the jack is moved, raised or lowered. A slight pressure on the handle tilts the jack back on to the rear castors, raising the front wheels from the floor and allowing the jack to be guided into any position. The raising or lowering of the jack or the locking of the handle is controlled by a small lever on top of handle. A foot pedal is provided to quickly raise the jack bar to proper height under the axle of car; the same pedal drops the rack after the jack is removed from under the car.

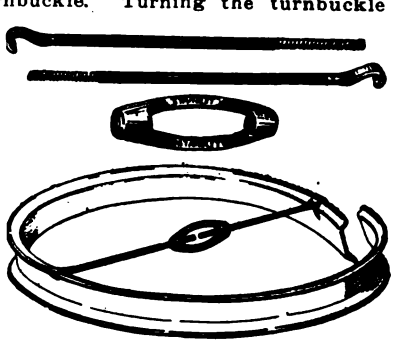
Six strokes of the handle raises the jack six inches in a few seconds, it is stated, the jack being lowered in same manner by reversing the lever. After the car is raised the handle on the Roll-A-Car can be placed in an upright position without lowering the car. This feature is very important where space is limited. The



pressure required to operate the device is claimed to be very small; the average car can be raised by the operator with one hand.

Manufactured by the Walker Manufacturing Co., Racine, Wis. Price, $50. Capacity lift in pounds, 5000; weight, 120 pounds.

The Standley Rim Tool is a device for facilitating the removal of tires from demountable rims. It is made in three sections, two rods and a turnbuckle, the rods having right and left hand threads respectively so that they may be tightened by the turnbuckle. One end of the rod is hook shaped so it may be slipped over the edge of the rim. When using the tool the operator places the hooks over the rim, first starting the threaded ends into the turnbuckle. Turning the turnbuckle to

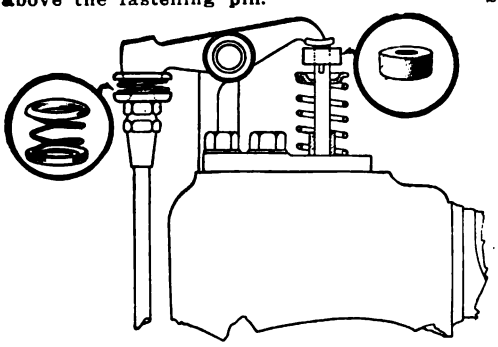


the right opens the rim, allowing the tire to be slipped over the edge. To replace the tire the operation is reversed.

Manufactured by the Standley Skid Chain Co., Boone, Ia. Price, East of the Rockies, $6; West of the Rockies, $6.50.

Digitized by Google

Automatic Take-Up for Valve Mechanism of Buick and Oakland Engines consists of a spring exerting three pounds pressure between the ball and socket of the rocker arm push rod joint, two caps holding the spring in place and a felt washer that is placed on the valve stem above the fastening pin.



The object of the spring is to exert sufficient pressure between the ball and socket joint to keep the push rod pressing firmly against its cam and the rocker arm bearing firmly on the top of the valve stem. It is stated that the use of this spring device helps to reduce wear at the ball and socket joints by stopping the sudden knock of the push rod ball when it comes in contact with the socket of the joint, silencing the contact and causing the parts connected with each to wear longer and to operate more quietly. The felt washer on the valve stem is filled with engine oil every 300 to 500 miles and keeps the valve stems lubricated, preventing excessive wear and compression leaks.

Sold by H. L. Frey Sales Co., 418 Beard Avenue, Buffalo, N. Y. Prices, Buick Six, $3.50; Buick Four, $2.50; Oakland, $3.

The Simplex Rim Remover is a tool for opening and closing split rims of the demountable type. This device works on the principle of a turnbuckle, the turnbuckle being operated by a hand wheel, that is easily turned by the hand of the operator. Clamps are fastened to the rim at each side of the split, while turning the hand wheel in one direction contracts the rim for removal, turning the wheel in the opposite direction expands the rim, when replacing it in the tire.

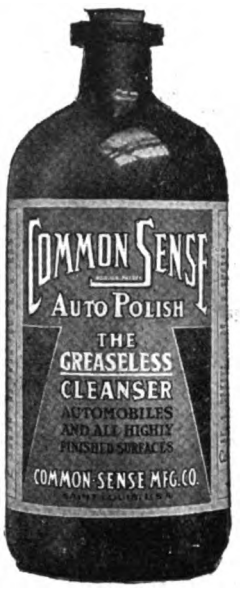
The device is made unusually strong, the jaws, hinges and bolts are steel, while the turnbuckle and wheel are castings.

The Simplex rim remover is manufactured in two sizes. No. 1 for use of the motorist and is of a size that is readily folded and carried in the tool box; No. 2 is larger and designed for service station and garage use, but is made similar to No. 1, but considerably heavier and longer.

The clamps are adjustable, so that they may be fitted to individual rims by simply opening the jaws of the clamps with a screw driver.

Manufactured by the Simplex Steel Stamping & Manufacturing Co., 1926-28 Gravois Avenue, St. Louis, Mo. Prices on request.

Common Sense Auto Polish is a liquid to be used by the motorist for cleaning dust and oil from the painted surface of the automobile. This polish is a laboratory product that has stood the test for about six years and is claimed to be beyond the experimental stage. Common Sense Polish is said to be made from ma-

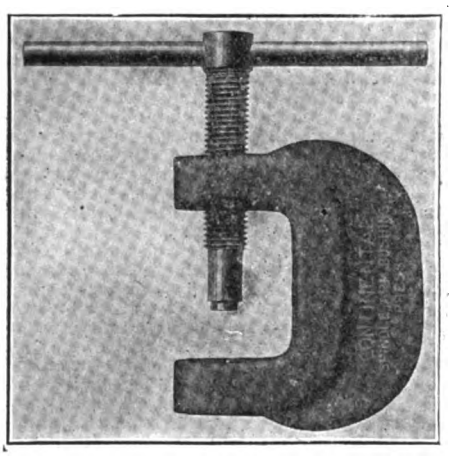


terials best adapted for this type of cleaning and when used according to directions is claimed not to injure the finish of the car in any respect.

Common Sense Polish is equally as well adapted to polishing such surfaces as rare china, porcelain, mirrors, enameled ware, etc., the blending of the different materials used in the formula being so perfect that it may be used for the purposes mentioned with perfect safety, it is stated.

Manufactured by the Common Sense Manufacturing Co., 500 North Whittier Street, St. Louis, Mo. Prices on request.

The Continental Spindle Arm Bushing Press was designed to remove and replace the worn bushings in the Ford spin-

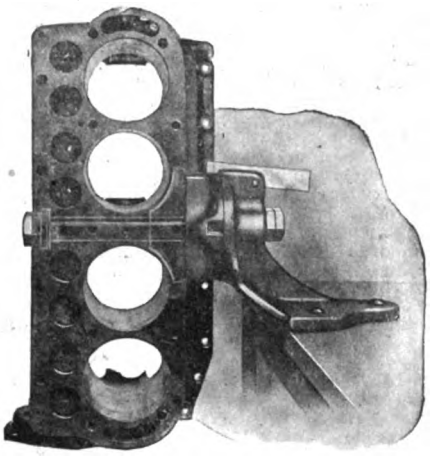


dle arm. The device much resembles a "C" clamp, but is built stronger and heavier. The device will remove bushings that are worn out on one side, as the screw is constructed to fit the shoulder of the bushing exactly, while the boss on the end of the screw exactly fits the inside of the bushing. The device is made of the best of materials, heavy cast iron being used for the clamp, while the screw is made of the best of tool steel.

The use of this tool greatly facilitates the removal of worn bushings and the replacing of new parts.

Manufactured by the Continental Auto Parts Co., Knightstown, Ind. Price, $5.

The A. B. Motor Repair Stand is designed to hold either the Ford engine block or the complete engine assembly breast high in any of the four positions, top, bottom or either end, allowing the work to be performed with ease and rapidity when repairing, assembling or disassembling the engine. The stand is fast-

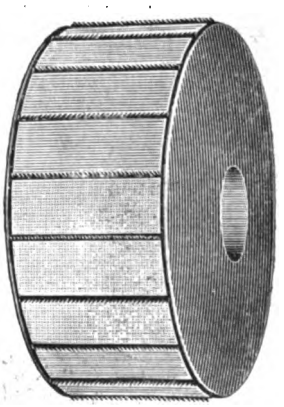


ened at the edge of the bench, allowing the work to swing clear and yet holding it in a firm grip, while the bench itself is left clean for tools and parts. The bolt is cast in the revolving part, hence it does not interfere with work on the center bearing bolts and nuts. As the A. B. stand is firmly bolted to the bench, it is never necessary to hold it with the hand.

The A. B. stand is strongly made of the best of materials and is tested to 1000 pounds, giving a large margin of safety.

Manufactured by the G. H. Dyer Co., 155 Brookline Street, Cambridge, Mass. Price, $10.

The Taber Tire Dressing Wheel is a device for tire repairing stations and is designed to enable the repairer to accomplish his work in shorter time and in a more scientific manner. The device is used either in an emery wheel or buffing stand and it is claimed may be speeded to 10,000 revolutions a minute without injury. Its special function is to remove surplus rubber from the casing prior to vulcanizing, or when applying re-treads, half-soles or other covers. The wheel consists of a carrier, or aluminum alloy center block, which has transverse slots into which the cutting blades fit. These blades are removable and can quickly be replaced with new ones at little cost. They are held in place by rings which intersect a notch in the end of each blade and the rings are held to their seats in the sides of the wheel by two spring steel discs which constantly exert pressure on the blades.



The size of the wheel is five inches in diameter, two-inch face and 1¼-inch opening in the center, which can be bushed to fit any arbor.

Manufactured by the T and T Tire Dresser Co., San Francisco, Cal. Price of the wheel complete, $20, and the blades are $6 a set.

Digitized by Google

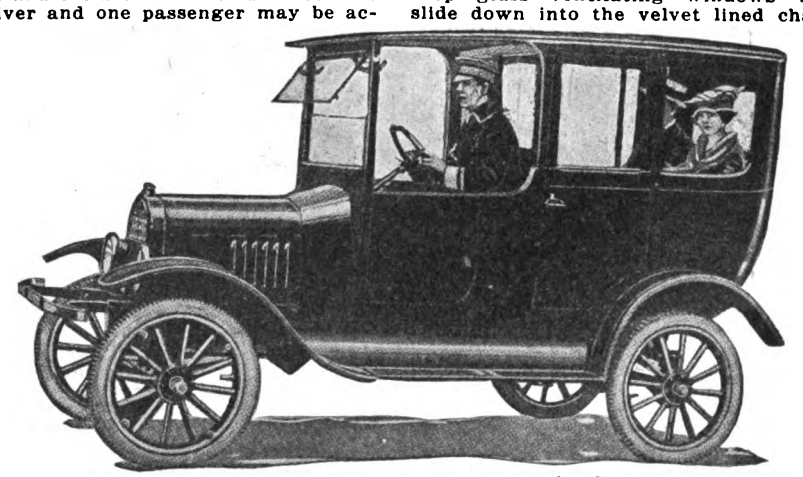
"Geneo" No. 111 Freesometer consists of an instrument, similar to a thermometer, to be used in testing the cooling medium

of the engine radiator, especially during winter months when some form of non-freezing solution is used in the cooling system. The instrument is guaranteed for one year.

Manufactured by the General Scientific Equipment Co., 2718 West Lehigh Avenue, Philadelphia. Prices and literature on request.

The New Taxicab or Limousine Body for the Ford Chassis is a new body that has recently been introduced to the trade. The body is made somewhat different for taxicab work than for private use as a limousine, especially in the front compartment of the driver.

For taxicab work the left hand door is left off, the floor is slatted and only one seat is provided. For private use the door is used and the seat is continuous so that the driver and one passenger may be accommodated. The rear compartment is provided with the regulation three-passenger seat and two extra folding seats for emergency use.

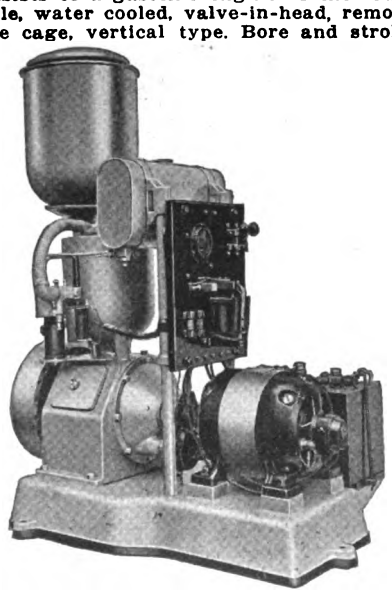


Still another type of body is made and this is known as the landaulet limousine, this body having the added feature of being an all-year body for either private use or taxicab work. The top in this body folds down over the rear compartment for summer use and for winter is in an upright position, as a limousine or closed car.

A special windshield is provided, having upper and lower sections, with the upper section hinged in such a manner that it swings forward. The regular equipment includes the windshield cleaner. The partition between the front and rear compartments is of glass, in two sections, that may be lowered. Doors are equipped with drop glass ventilating windows which slide down into the velvet lined channel in door panel. Interior trimming is of Spanish leather, and the roof and sides are trimmed to match. A roll-up curtain is provided for rear window and a set of side curtains for the driver's compartment. Electric dome light furnishes illumination in the passenger's compartment.

Manufactured by the Anchor Top & Body Co., Cincinnati, O. Price and literature on application.

The Holt Electric Power Light Plant is for the service station where city power is not available and the farm home. The Holt plant does not require a set of storage batteries from which current may be drawn when the plant is not working, but operates automatically whenever a light is turned on or a piece of electrical apparatus is used, such as a motor, toaster, percolator or other apparatus. The plant consists of a gasoline engine of the four-cycle, water cooled, valve-in-head, removable cage, vertical type. Bore and stroke 2⅜x3 inches, normal 1600 revolutions per minute. An electrical starter is made a part of the generator.

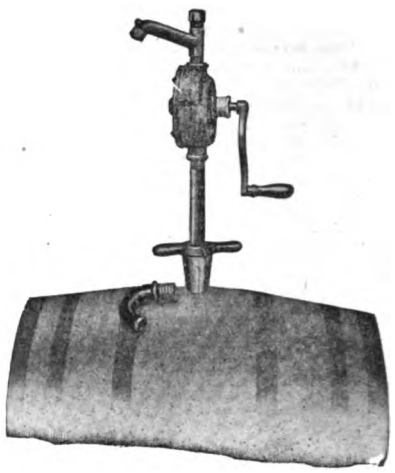


One end of the generator is wound for a six-volt current, supplied by a single six-volt storage battery, and is used solely for starting the engine. The opposite end of the generator is wound for a 110-volt current and is used for lighting and power purposes. The capacity of the generator is 25-30 watt lamps or several pieces of electrical apparatus at the same time. The lights do not flicker, but glow with a steady white light.

The capacity of the water supply tank and condenser is 4½ gallons; starting and ignition battery six-volt, 86-ampere capacity; ignition, Atwater Kent; carburetor, float feed type with hot air connection to cylinder; oiling system, automatic, with one place provided to oil entire system; governor, electric solonoid type, assembled as a unit with the carburetor; special generator, compound, wound, multipolar type with double commutator, six-volt at one end and 110-volt at other, built by the General Electric Co. A simple control switchboard is mounted on two vertical standards. The complete plant is assembled on a strong iron base.

The Holt plant is economical in operation, as it develops power according to the demands required of the current developed by it. When burning one light the power is in proportion to the current consumed and when operating at full capacity the power developed is in proportion to the work required of its current.

Manufactured by the Automatic Light Co., Inc., Ludington, Mich. Price, $450 f. o. b. factory.

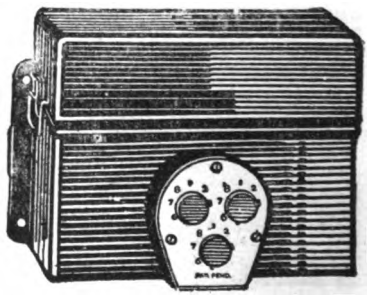


The No. 9 Hand Transfer Oil Pump is of the rotary type to be used by garage and service stations for the transfer of oil from shipping barrels or tanks to the garage or service station oil containers. The outfit includes the pump and a taper bung attachment for use with wooden barrels, or a special holder for use where steel shipping drums are used, which protects the threaded hole and holds the pump rigid. The crank is made of malleable iron and is fitted with a wooden hand grip. A non-drip spout is furnished having a tubular hook for end of hose to hook into barrels. A malleable iron spout may be purchased in place of the regular spout to reach from the center of drum to the center of the can being filled.

The pump has the "take-up-for-wear" feature that is typical of all Blackmar pumps. The weight is only 30 pounds complete with all attachments. The pump has a capacity of one-eighth of a gallon per revolution and one-inch connections. A suction pipe 36 inches long is furnished with each pump. The pump is guaranteed against rust or corrosion when fitted with bronze buckets.

Manufactured by the Blackmar Rotary Co., 1347 Book building, Detroit. Prices on request.

The Christie Auto Lock for Ford Cars consists of a combination lock attached to the regular Ford coil box in place of the regular ignition switch. There are three combination dials with the numerals running from one to eight. It is claimed that the lock is thief proof, as there are no tumblers in the lock and all wires are so enclosed that they cannot be reached. When the lock is on the coils are also



locked so that their removal is said to be impossible.

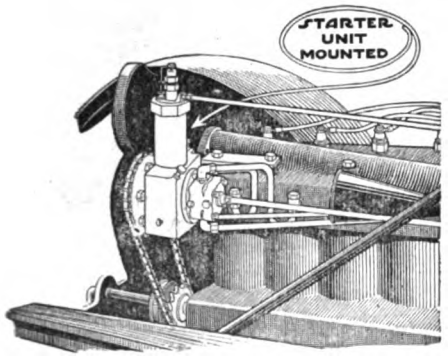
In attaching the Christie lock the heads of the bolts are covered by the top of the lock and cannot be removed. The cover cannot be removed when the lock is on. The Christie can be locked and unlocked rapidly. The combination may be changed to suit the owner and as many times as desired in about 90 seconds. Every time a new combination is tried it is necessary to get out and crank the car to see if it is unlocked, as tumblers are not used in the lock.

Manufactured by the Christie Auto Lock Co., 6607 Dorchester Avenue, Chicago. Price, $6.

Digitized by Google

The Ten Eyck Air Starting System for the Ford consists of a storage tank supported from the frame of the car under the seat, connected to an air pump, and located at one side of the engine at the front, the pump driven by a chain from a sprocket on the crankshaft and a control valve located on the steering wheel. The operation of the pump for starting is by means of the air control on the steering wheel. Three positions are shown here, neutral, start and pressure.

Placing the lever to the right allows the air to pass from the distributor of the pump to the cylinders of the engine, the air being taken from the tank. After the engine is started the pump operates and, by turning the lever by neutral to the left position, air is forced into the pressure tank to bring up the pressure again. It is claimed that pressure enough is carried



in the tank for from 12 to 20 starts. With the control lever in the neutral position the air is allowed to escape.

About one-quarter horsepower is required to operate the pump when pumping against the pressure of the tank, but when pumping into the air the power required is a negligible quantity. A primer button is provided for cold weather starting and is located on the floor of the car within easy reach of the driver.

The manufacturer claims that the use of air under high pressure will have a tendency to force out any accumulation of carbon from the cylinders before it has the chance to harden. The device is guaranteed for one year against defective material, which should be returned to the factory, express paid.

Manufactured by the Air Device Co., 2975-77 Cottage Grove Ave., Chicago. Prices on application.

The Kriesel Multi-Purpose Machine is a combination of three machines in one for the machine shop of the service station and garage. It will handle an unlimited range of boring, milling and drilling jobs accurate and economically. The frame and base are cast in one unit, assuring perfect alignment of parts.

It is possible to purchase the machine for boring and reboring work only, adding the milling and drilling features later as desired. The machine may be bought on a plan enabling the purchaser to pay for it from the profits of work done on it.

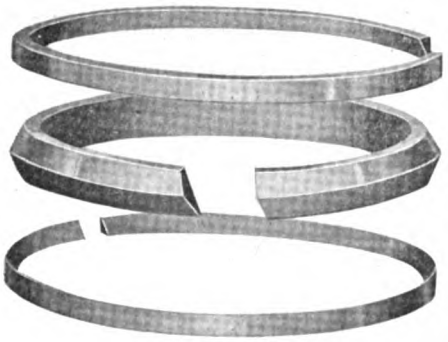
Such work as reboring, drilling, cutting gears, squaring a shaft, cutting keyways

for both straight and Woodruff keys, drilling wrist pin holes and practically all classes of machine work in automotive repairing may be done on this machine.

The maker announces that the machine is built throughout from the best material obtainable and that all cutting tools are of the highest grade steel for the purpose. Four roughing tools, four finishing tools and many other attachments accompany the complete machine.

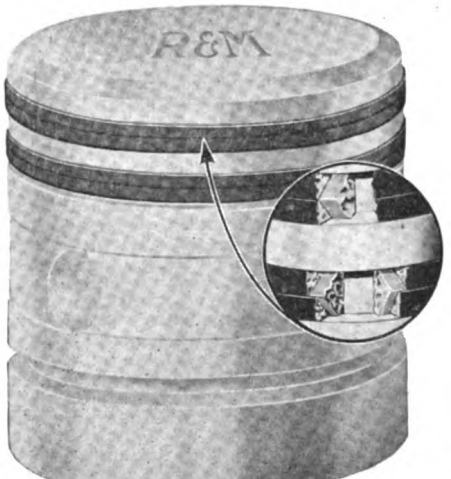
Manufactured by the Mill City Co., 800-823 Plymouth Building, Minneapolis, Minn. Prices and literature on application.

The R & M Conform Piston Rings are formed of three sections, the inner or "bull ring" and an upper and lower section. Wear does not affect the inner or bull ring and all wear is taken by the outer rings or sections. The manufacturer claims



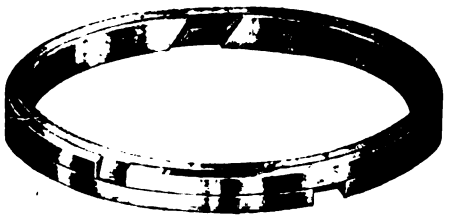
that this type of ring is absolutely gas tight and that two rings will prove as satisfactory on a piston as three. As the spacing between the rings is at different points there is no chance of the gas leaking past.

The R & M Conform Ring is not an experiment, but has been used successfully by the inventor on all types of cars and trucks and has been proved out in the hardest fields and under conditions that the average car owner would never meet,



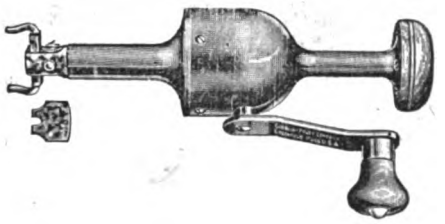
it is claimed. Long life and economy are guaranteed by the maker, who states that the points where wear may occur are easily removed.

The rings are sold direct from the factory to the service station and garage trade or through the jobbing trade. A money back guarantee goes with the sale of all R & M Conform Rings.



Manufactured by the Modern Electric and Machine Co., Indianapolis, Ind. Prices on application.

Goodell Pratt Valve Grinder No. 288 is a hand tool used by the automobile and truck repairer for grinding valves in gas engines. By means of a simple operating mechanism the spindle is caused to rotate back and forth when the crank is turned continuously in one direction. The cast iron casing, in which the working parts are enclosed for protection, gives the tool



sufficient weight so that additional pressure need not be applied to the valve seat.

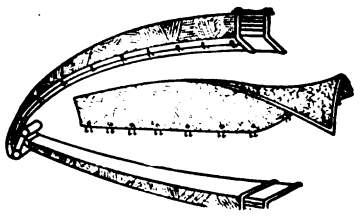
Each tool has a polished hard wood crank handle and a Lignum-Vitae head. The frame is finished in red and black enamel. Both an adjustable spanner and a blade are provided in order that the tool may be used universally. The length over all is 10¼ inches and the net weight 3¼ pounds.

Manufactured by the Goodell Pratt Co., Greenfield, Mass. Price, $4.20.

Woodworth Lubricating Spring Cover is a new spring covering manufactured for the trade for the 1920 season. It consists of a cover of leather or imitation leather, lined wth wool felt and saturated with oil. It is placed on the spring and the edges hooked in a suitable manner, making a covering that is oil, dust and water tight.

The manufacturer claims that springs oiled in this manner will not require oiling more than once in one or two years.

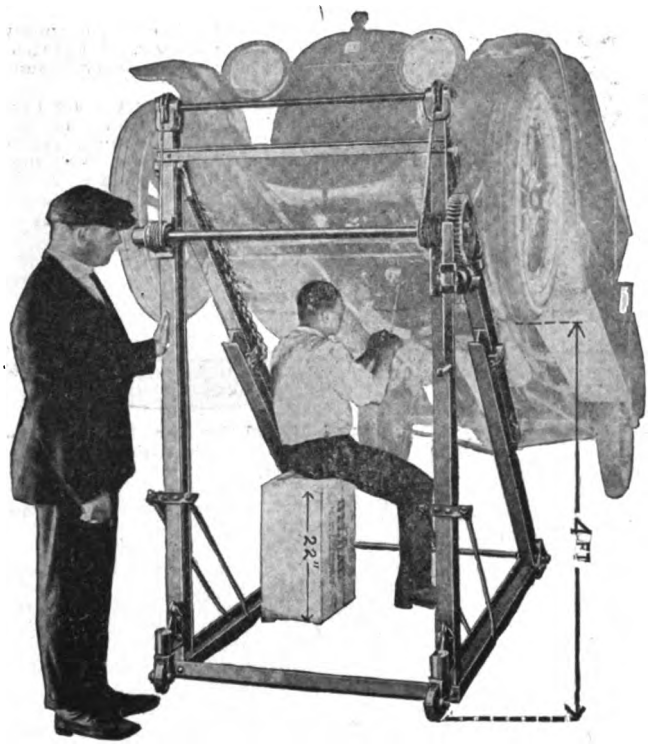
The covers are easily fitted to any make of car, full instructions being sent with each, and they are very convenient for dealers to handle, as there are only seven standard sizes besides the Ford sets to fit



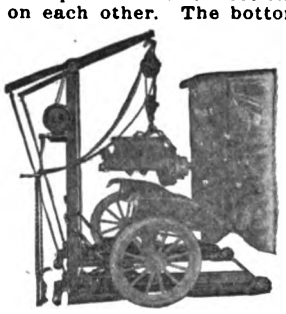
all cars. They are made of two grades, one having an outer covering made of oil and water proof leather and the other having the outer covering of imitation leather, which is also proof against oil and water. Dealers and jobbers are asked to correspond with the manufacturer regarding these covers, as an interesting proposition is offered.

Manufactured by the Woodworth Manufacturing Corporation, Niagara Falls, N. Y. Prices and literature on application.

Digitized by Google



The Kiemame Auto Hoist and Crane is a combination device for garage and service stations, designed to obviate many of the disagreeable features of service station work. The frame is made of girder shaped steel bars, fastened at the joints with hot rivets and well braced with steel rods and clips. The girders forming the lifting device are composed of two sections each, slidable on each other. The bottom girders are hinged at the bottom while the upper girders slide on guides attached to the lower bars and are pulled by steel chains attached to wire cables running over pulleys attached at the top, the cables being fastened to steel drums mounted on a cross shaft and operated by a worm gear, worm and crank at the side of frame. Forked slides at the ends of the slidable girders allow the arms to rise against the main frame when the front or rear end of car is lifted.



The crane attachment is easily fitted to the hoist in a few minutes time and with it it is possible to easily remove units from the chassis of the car with the least effort by means of the worm, worm gear and crank. The hoist and crane is mounted on rolls so that it may be easily moved.

Sold by Bailey-Drake Co., Inc., Chicago, Ill. Price complete. $175, chain block not included. Weight 600 pounds.

The Steiner Hydrokit consists of a convenient container for distilled water and a very accurate, non-breakable hydrometer carried in the same container. To test battery, the hydrometer is removed from the container, the water is squeezed from the glass bulb and the small rubber tube inserted in the cell to be tested. After noting the reading the electrolyte is replaced in the battery cell and the next cell tested in like manner. When through testing, squeeze the electrolyte from the glass bulb and supply fresh distilled water from the container if necessary. It is stated that the Hydrokit may be safely carried in the tool box of the car and will stand rough usage without breaking. The container is guaranteed to be acid proof and water tight.

Manufactured by the Steiner Manufacturing Co., 530-532 Jackson Avenue, Long Island City, N. Y. Price on request.

The Continental Ford Engine Stand is a modification of the regular Continental motor stand, but designed to handle the Ford engine only This device is similar in construction to the original stand and is built throughout of the best of materials by skilled workmen.

The Continental Ford stand makes it possible to perform every operation necessary in overhauling the Ford engine while setting in the stand. Self-locking features make it possible to turn the engine to any angle and lock the engine securely, the engine being held absolutely rigid while in the various positions.

The stand is of heavy construction, many of the parts being built of steel. Every stand is portable and may be used or moved to any part of the service station while work is progressing.

The chief feature of the Continental Ford engine stand is that the complete engine may be placed in the stand, and it is not necessary to remove the engine till all of the overhauling work is completed.

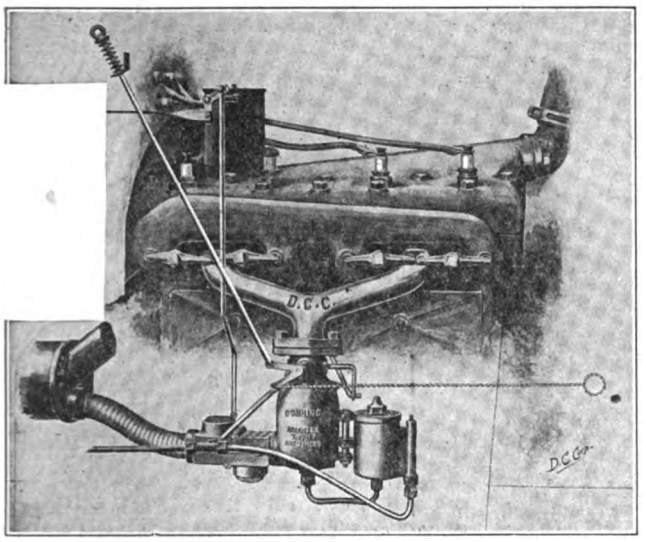
Manufactured by the Continental Auto Parts Co., Columbus, Ind. Price, $30 f. o. b.

The Canedy-Otto Universal Piston Clamp is a device for holding pistons during the process of disassembling or reassembling connecting rods. Also for holding pistons while reaming or bushing for wristpins. The clamp is lined with babbitt, therefore it will not mar the piston or rings. The device is fastened to the work bench at any convenient point by three screws or bolts, while the clamp is operated by a knurled hand wheel fastened to a large threaded screw fitting a ball and socket

recess in the slidable clamp. The Universal Piston Clamp is made from the best grade of cast iron. Net weight, nine pounds.

Manufactured by the Canedy-Otto Manufacturing Co., Chicago Heights, Ill. Price, $7.50.

Digitized by Google



The Donning Vaporizing and Gasifying Carburetor for Ford Cars combines a priming device, heating unit and thermostatic control in one unit, that is easily operated by the driver either from the dash or in front when starting the car.

The carburetor differs from the regular Ford type in that the float chamber is located at one side instead of being a unit with the carburetor. Gas is drawn in by the suction of the engine from the bowl through metal tubing to the bottom of the mixing chamber, passing through a venturi tube and mixing with the warm air drawn in through the air inlet from the special stove surrounding the exhaust pipe and joined to the carburetor by flexible tubing. A special priming device is tapped into the fuel line, allowing gasoline to be forced into the manifold for priming purposes. This device is connected by a rod to the dash and by a pull wire through the radiator coil to the front of the radiator. A special thermostat placed on the top of the number four cylinder, is fastened to the dash and connected to the air inlet by a rod, controlling the flow of warm air from the stove. Throttle control is accomplished in usual way by a rod passing between the second and third cylinders, connecting with a butterfly valve in the intake manifold. Provision is also made for heating the carburetor with hot water during cold weather and it is stated that this device works equally well in the hottest days of summer or the coldest days of winter.

Manufactured by the Donning Carburetor Corporation, Sanford Street to Unquowa Road, Fairfield, Conn. Price complete ready to install, $16. Installation from $1 to $2.

Ford Reamer Sets, comprising eight reamers, covering 15 bushings, are put up in neat hard wood boxes for the Ford service station and repair shop trade as follows: 2713-14, spindle arm and body bushing; 2559 X, hub camshaft bushing

(extra long reamer); 3022½, piston pin bushing; 3042, camshaft front bearing bushing; 3043, camshaft center bearing bushing; 3044, camshaft rear bearing bushing; 3545, steering post bearing bushing; 3052 B, valve stem bearing; 1916, 1/64 oversize; 3320 B C, transmission driven sleeve bushing; 3311, transmission sleeve bushing; 3820, front spring perch bushing; 3844, rear spring perch bushing; 3314½, transmission triple gear flanged bushing. Reamers are made from the highest grade tool steel by experienced workmen and under a system that insures the highest efficiency and accuracy. It is stated that the Keystone reamers are used in large quantities by a majority of the builders of the best known standard cars.

Manufactured by Keystone Reamer & Tool Co., Millersburg, Pa. Prices on request.

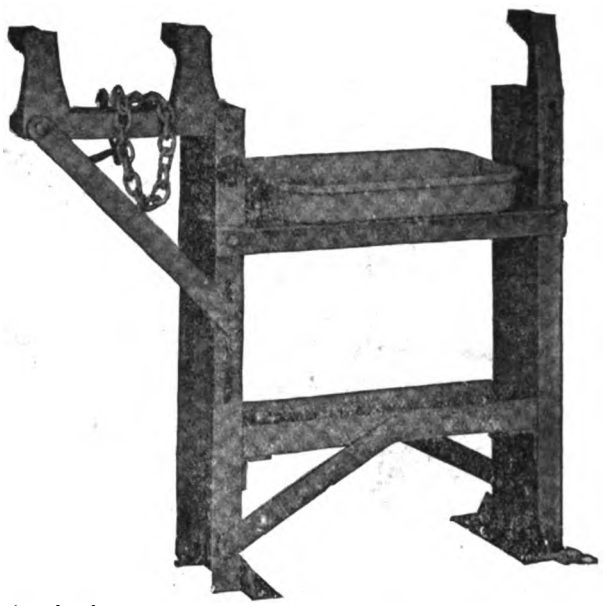
The Roedding Signal Tail Light is especially adapted to enclosed cars where it is impossible to signal by hand, and is equally applicable to open cars.

The device, as its name implies, is attached to the rear light bracket in place of the regular light and is connected to a 2½-inch disc attached to the steering

wheel, operated by the driver without removing hands from the wheel. The signals are communicated to the rear light, showing in easily discernible letters the driver's intention, whether of proceeding to the right or left, to stop or back up.

The Roedding signal operates by electricity from a battery or dry cells, is water proof, dust proof and is quickly installed in any make of car. When the car is moving ahead the rear light only shows. It complies with the law of all states where some form of signaling device is specified.

Manufactured by the Grand Rapids Brass Co., Grand Rapids, Mich. Prices on request.



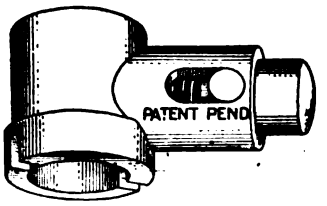
The Continental Engine Stand is designed to overcome the difficulties usually found in service stations when disassembling and assembling rear axle systems. In service work the axle is removed from the car or truck, placed on the Continental axle stand and clamped firmly in position on the adjustable vise. The taper of the housing is taken care of by this adjustment. The axle is at a convenient height to work on and the mechanic has every part at hand. The axle may be torn down, whether semi-floating, three-quarter floating or full-floating construction, without unclamping the axle from the stand. The semi-floating axle may be split open exposing the gears and integral parts without lost effort. A grease pan takes care of the old grease and oil as fast as it flows from the differential housing, while the tool tray is very convenient for the repairer as it may contain whatever tools are necessary for the work in hand.

The Continental axle stand is universal and is large and strong enough to handle any and all types of axles both front and rear and has proved itself indispensable to the garage and service station doing a large amount of axle overhauling work.

The stand is heavily constructed of cast iron and steel, is 34 inches high and takes up a floor space of 12x22 inches.

Manufactured by the Continental Auto Parts Co., Columbus, O. Price, $46, f. o. b. Shipping weight, 145 pounds.

The "Master" Timer Brush is designed to take the place of the regular roller timer employed in the Ford timer case and consists of an aluminum hub fitting the end of camshaft, and an arm carrying the slidable brush which makes contact with the contacts of the timer case. The slidable brush is of copper alloy, held in place by a spring tension in the arm. It is stated that this type of contact im-

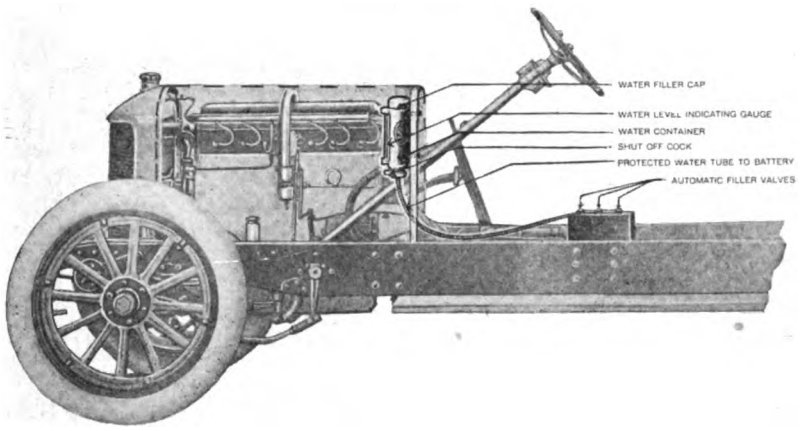


proves the starting qualities of the Ford engine during cold weather, as it provides a much larger contact for the current then the regular roller type. The manufacturers guarantee this timer brush for 5000 miles.

Manufactured by the Master Products Co., Detroit, Mich. Price, brush, each, 75 cents; commutator case, including brush, $1.25.

Digitized by Google

The 20th Century Automatic Water Filler for Storage Batteries consists of an aluminum water container of about one pint capacity, screwed to the dash board under the hood. A gauge at the side of



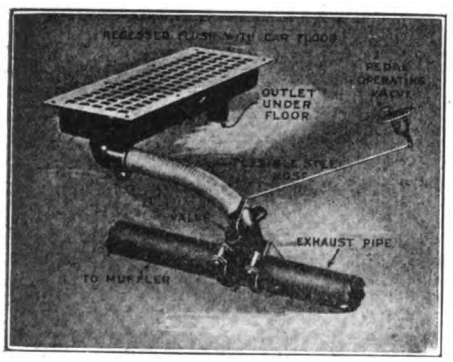
container shows the water level at all times, the water flowing to the battery through a flexible metal covered rubber tube to the caps of the battery. Special hard rubber filler caps containing a float valve are furnished with each outfit to be substituted for the regular caps of the battery. As the level of the electrolyte goes down the valve opens and allows just enough water to drop into the battery cells to bring the electrolyte to the proper level and the valve then closes. A petcock just below the container allows the water to be shut off at that point if desired.

Sold by Forrest Co., Inc., distributors of West Gasaver and 20th Century automatic battery water filler, 1974 Broadway, New York City. Price, $10. When ordering give make and model of car, location of battery and name and type of battery.

The Eureka Automobile Heater is a device heated by exhaust gases and is placed in the rear compartment of the car, fitting flush with the floor boards and opened or closed by a small lever at the side that may be operated by the foot.

The radiator is made of aluminum, the exhaust gases enter at the side through a pipe having a flexible connection with the exhaust pipe, heating by transfusion the pure air which enters the car body through openings in the floor plate, while the gases escape through a pipe outlet at the side of the car.

The Eureka heater is constructed on scientific principles, by which all operating expense is eliminated, as the waste



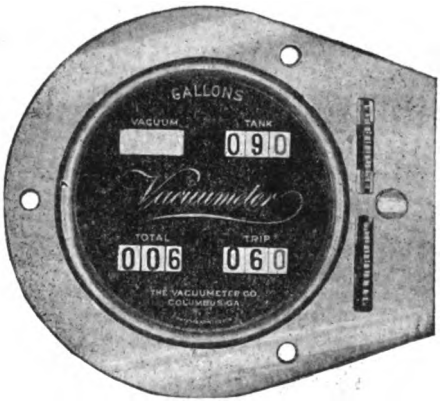
gas from the exhaust is utilized. The heater is made of aluminum and pressed steel, finished in nickel, and is claimed to combine the essential points of lightness, strength, appearance, radiation and economy.

It is stated that this system can be installed in one hour's time by any good mechanic.

Manufactured by the Eureka Accessory Company, 404-405 Dollar Bank Building, Youngstown, O. Price, $20, complete.

The Vacuumeter is a neat dash board instrument of the speedometer type that tells the amount of gasoline in the fuel tank, total gallons used to date, gallons used per trip and also indicating in a special window whether the vacuum is in working order or not by a shutter changing from white to red.

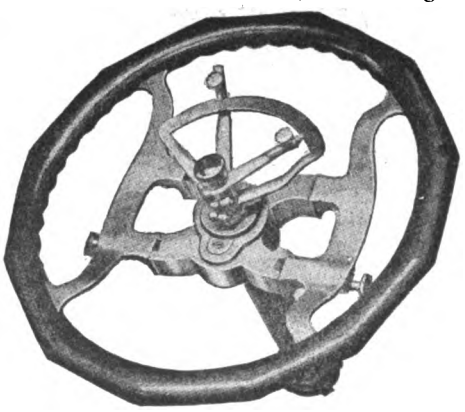
The Vacuumeter is connected to the top of the Stewart vacuum tank by a short length of copper tubing, which is the only connection necessary for its successful operation. The gasoline does not pass through the Vacuumeter on its way to the vacuum tank, but the device is operated by the vacuum in the tank.



It is stated that the readings of the Vacuumeter are absolutely accurate and that by its use owners of cars equipped with this device are enabled to tell how much gasoline is consumed for a trip or for the season, besides acting as a check on the adjustment of the carburetor.

Sold by the Vacuumeter Selling Co., 1410 Girard Avenue, Philadelphia, Pa. Price, $18.50.

The Tilting Lockable Steering Wheel is manufactured in three styles of rim. The first, known as the Liberty model, is equipped with either a 17 or 18-inch wheel as desired, and is fitted with interchangeable bushings in the hub of the wheel to fit all types of automobiles and steering shafts. The wheel consists of a polygon corrugated walnut rim, with aluminum spider arms, buffed, polished and inserted in the wheel rim, the spider head being constructed of malleable iron and the center bushing of steel, sherardized to match the aluminum finish.



The second style is similar in construction to the first, but differs from it in that the wheel is corrugated on the inner side and smooth on the outside. Either style may be tilted up or down to suit the convenience of the driver, by means of pull pins in the spider arms. When pulled out the wheel passes by projecting arms at each side of the center or hub and is hinged at the front of the hub by two similar projecting arms. A Yale lock is provided in the hub of the wheel by which it is locked in such a manner that the wheel turns freely on the steering column without operating the steering mechanism. It is stated by the manufacturer to be proof against theft.

A tilting lockable steering wheel is adapted to all cars larger than the Ford, a smaller style being made for the latter working on the same principle, the wheel and spider being similar to the regular Ford equipment, but differing from it in that the locking and tilting features are combined in one unit, as in the larger sizes.

Manufactured by the Detroit Steering Wheel Corporation, 1231-35 Woodward Avenue, Detroit, Mich. Prices, No. 1 and No. 2, Liberty model, 17 and 18-inch, $29; No. 3 and No. 4, Liberty model corrugated, 17 and 18-inch, $24.50; Ford model, 16-inch corrugated, $18. Specify make and model of car when ordering to secure bushing required in the hub of wheel.

The "Shuro" Cell Tester is designed for storage battery service station testing and shows, by short-circuiting each individual cell, the condition of the charge of that cell. This instrument is specially designed to meet the constant demand of the battery expert and the automobile owner. The simultaneous voltammeter is

mounted in a position by which it can be easily read and is amply protected. The light above the voltammeter will quickly indicate the condition of the cell being tested.

The simultaneous voltammeter has a double scale, the upper reading volts 0-2, the lower amperes 0-250, which gives accurately the voltage of each cell under a discharge test. Full instructions accompany each tester.

Manufactured by H. B. Shonts Co., 157 West 54th Street, New York City. Price with meter, $17; without meter, $8.50.

Digitized by Google

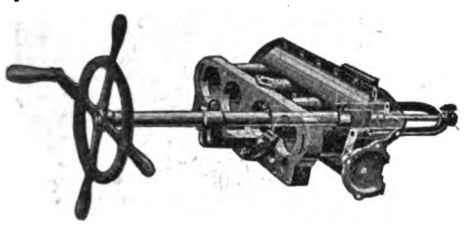
Heiser's Improved Cylinder Reboring Machine for the Ford Engine is a tool for the Ford service station repair shop and comprises many unusual features that recommend it especially for cylinder reboring work.

This tool rebores between centers, insuring a finished cylinder that is square with the crank shaft, as well as being straight, round and true. The cutters leave a finish closely resembling a ground finish. This is the only tool, except expensive grinders, it is claimed, that will not leave the finished cylinder slightly tapered towards the bottom.

The left side of the Ford cylinder always suffers the most wear. For this reason it is impossible to hold the compression with new or over-size piston rings, without first trueing out the cylinder. The cylinder must be as true as the rings for perfect work.

Reboring and fitting over-size pistons is the most important repair that can be given an engine, for by fitting these parts properly, they are made as tight, true and new as the day the car was first delivered.

The time required to rebore all four cylinders with the Heiser's improved reboring machine is from 60 to 90 minutes. The machine is self-centering, as it centers itself from the unworn portion of the engine cylinder. The reboring tool is fastened at the top of the cylinder by a special bracket that holds the shaft of the



tool in a rigid position, while the base end is fastened by a plate extending across the base of the cylinders and fastened to the base by screws, thus holding the lower end of the shaft rigid.

The cutting bit is sharpened and given the correct amount of clearance without an emery wheel, or the necessity of sending it to the factory, or to a machine shop, as it may be sharpened by any one handy with sharpening tools.

The Heiser reboring tool is operated by a hand wheel having an increased leverage so that the operation of the cutting tool is very easy. The cutter is adjustable so that cylinders may be bored to any size desired, from those that have only seen a few months service to those that have been in service for many years.

The maker states that centering of the cutter is easily accomplished after a trial and once properly set does not have to be changed to rebore the other cylinders of the set.

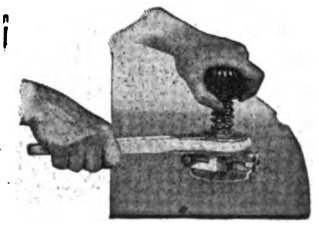
Manufactured by the Heiser Special Tool Co., Kingston, Mo. Prices, $42, cash with order. Over-size pistons, complete with rings, pins and bushings, .015, .031, $1.60; .045, $1.90.

The "Jiffy" Adjustable Cutter is a small portable tool designed to cut holes varying from 1¼ inches to six inches in diameter. The Standard knives, supplied with the device, will cut through steel 3/16 of an inch in thickness. Special knives can be supplied for cutting through ⅜-inch metal and also knives for cutting holes in one-inch material, such as slate, marble, fiber, etc.

The device is made in three sizes. No. 1 outfit cuts holes from 1¼ inches to three inches in diameter, and the No. 2 outfit from 1⅜ inches to six inches in diameter. The No. 12 outfit is a combination of both of these sizes.

In addition to the holder and ratchet wrench the outfit consists of a small knife holder wrench for adjusting the knives. New knives or cutters can be secured as they are needed. The appliance is especially desirable to electrical men and service station repairers.

The tool consists of a swing chuck with two knives adjustable to various centers. The swing chuck is a steel casting. Pressure is put on the knives by means of a heavy spring. Rotation of the knives is secured by applying to the swing chuck a special ratchet wrench, made of malleable iron.

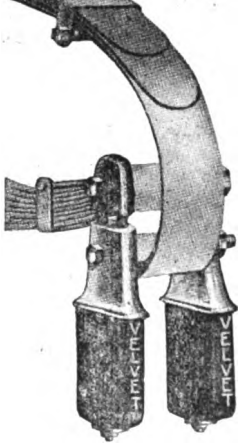


A ⅜ inch pilot hole is first drilled, and in the case of thin material a flange nut is put on the opposite side of the sheet so that the stud may be placed through the pilot hole and screwed into the flange nut. For cutting heavy material the pilot hole could be tapped with standard thread for receiving the stud, thus eliminating the use of the flange nut where it might be difficult to get back of the material to place the flange nut in position.

Outside of the many ordinary applications, such as cutting holes in service and distribution cabinets, boiler tanks, dash iron, steel plates and sheets, etc., there are many special applications, such as cutting holes in heavy structural steel members, and where awkward shaped castings, which cannot readily be drilled by machine process, are encountered. This tool should prove of value in cutting through plates where it is not practical to set up gas flame cutting outfits. Special washers can be quickly cut by setting one of the knives at the inner diameter of the washer and the other at the outer diameter. The tool cuts holes in a neat and clean manner, and work can be done much better and much faster with it than by the old method of cutting holes with a hammer, cold chisel and punch.

Manufactured by Paul W. Koch & Co., 19 South Wells Street, Chicago, Ill. Prices and literature on request.

Velvet Shock Absorbers, Model E and Model F for cars with half-elliptic springs are attached by special shackles to the rear of the spring ends. A feature of the Velvet shock absorber, that especially appeals to the motorist, is the fact that in changing them from one car to another it is unnecessary to discard them and pur-



chase new shock absorbers as the springs may be removed and replaced with heavier or lighter springs according to the weight of the car to which they are to be attached.

Velvet shock absorbers have an adjustable feature, by which they may be made either stiff or light, according to the load carried by the individual car.

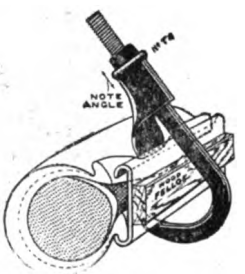
The absorbers are simple in construction, are made throughout of the best of material by skilled workmen, and are made in different sizes for cars weighing from 2200 pounds up to 4800 pounds. In ordering, give make, model and year of car, also weight of car, width of the rear springs and diameter of rear spring bolts. Also mention whether the car is a touring car, runabout or closed car.

Manufactured by John W. Blackledge Manufacturing Co., Chicago, Ill. Prices on request.

Essenkay Tire Filler for passenger car and light truck owners using pneumatic casings consists of a prepared filler, put up in a convenient form for handling, and connected in lengths according to the size of casing in which they are to be used.

The filler is placed in the casing and forced on to the rim of the car wheel with a special tool provided for that purpose.

It is stated that with Essenkay tire filler the casings wear down to the last layer of fabric when the filler is removed and placed in another casing and are used



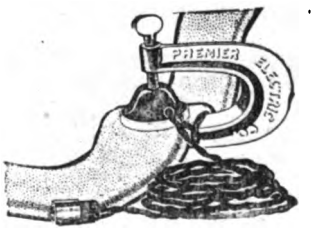
indefinitely, this operation being repeated as often as the casings wear down. It is pointed out that Essenkay tire filler contains no rubber, therefore it cannot harden, oxidize or bloom.

The manufacturer has a free trial offer to owners of passenger cars and trucks that is very liberal. It is stated that Essenkay is the ideal solution of tire problems for the owner of any vehicle which requires easy riding, shock absorbing tires which at the same time are not subject to deflation by means of punctures or blow-outs.

Manufactured by the Essenkay Products Co., Grand Avenue and Orleans Street, Chicago, Ill. Prices on request.

It's-It Electric Vulcanizer for the motorist's tool kit is an emergency outfit for vulcanizing tubes by the electrical current taken from the storage battery of the car in case of emergency.

The vulcanizer is small and easily placed in the tool box. When using the patch is placed on the roughened tube in the usual manner, the clamp screwed down tight and the plug on the end of the cord placed in a socket provided for it on



the dash or other convenient place on the car and the current from the battery turned on. It is stated that about 10 minutes are required to vulcanize a patch with this device, that the amount of current drawn from the battery is small and that the patch is vulcanized as thoroughly as though done with a larger outfit.

Made either for six or 12-volt batteries and furnished complete as shown with patches ready for use. When ordering mention voltage and style plug desired.

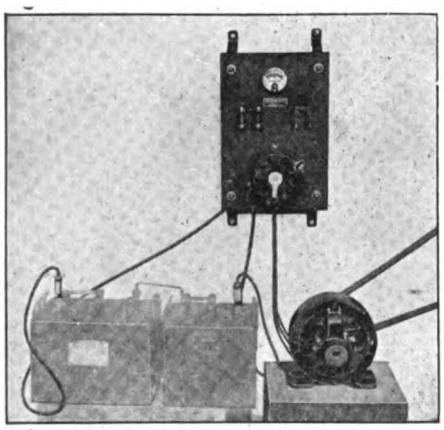
Manufactured by the Premier Electric Co., Grace and Ravenswood Avenue, Chicago, Ill. Price, $1.

Digitized by Google

Main Battery Charging Set No. 1 consists of a belt driven outfit to be operated from the power shaft of the service station. The outfit consists of a charging dynamo of superior design, having oil ring bearings, a high grade armature and field coils. The capacity of the generator is 300 watts and can supply 14 amperes when charging one six-volt battery or eight amperes when charging five six-volt batteries at one time. A slate charging panel is included in the outfit, equipped with ammeter, rheostat, necessary fuses, switch, an iron frame for mounting on the wall and a set of long flexible leads with universal snaps for making connections to batteries when charging.

It is stated that the probable cost to operate the main battery charging set from any source of belt driven power will run from 1½ to three cents a kilowatt-hour.

A larger outfit is manufactured by this company, which has a charging rate about three times that of the No. 1, which is de-



signed primarily for service and battery charging stations, and is capable of charging several sets of five six-volt batteries in multiple at a time; that is five six-volt batteries or any combination, such as one six-volt and two 12-volt, etc., so long as the voltage does not exceed 30, and two or three such combinations in multiple at the same time. The dynamo of the No. 3 set is similar in design to that of No. 1, but is much larger, is equipped with a flywheel pulley and furnished with sliding base for taking up the slack of the belt.

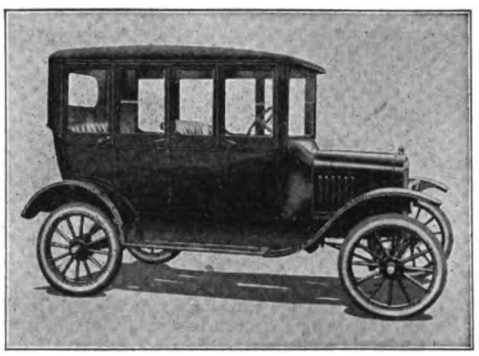
The switchboard is similar in design, but is much larger, has larger instruments, heavier switches, fuses, etc.

Manufactured by the Main Electric Co., Cleveland, O. Price, No. 1 set, $105 f. o. b. Cleveland; No. 3 set, $205 f. o. b. Cleveland.

The Miller Ideal Enclosed Auto Top for Ford Cars is combined with patent Miller windshield standard, which allows the windshield to be opened for ventilation and affords complete adjustment to the

variations in length of Ford cars. The windshield rests against a heavy felt pad, preventing rain or snow from entering when closed.

The enclosed auto top is constructed of selected seasoned hard wood, having 16 bows, 18 slats and a solid back. All joints and slats are separately glued, nailed and screwed, while all sash is dovetailed at the joints, glued and nailed. Over 1000 nails and screws enter into the construc-

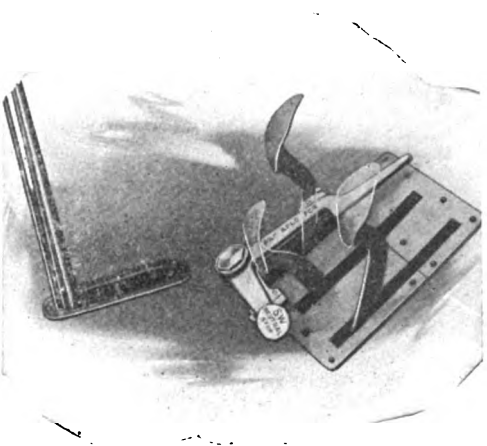


tion of a Miller Ideal auto top. The curves in the back and top are of steel and the front standards are of 20-gauge steel, adjustable. The top covering is the best grade Neverleak, lined with fine black and white whipcord. A neat metal moulding prevents rain from dripping on the windows, and the glass used in the windows is extra heavy clear vision "Crystal."

The doors and left front panel are equipped with a divided or ventilating glass. The doors open at the same time with the body door.

Manufactured by the Miller Top & Body Manufacturing Co., Caro, Mich. Prices on request.

The S-W Neutral Stop for the Ford Foot Pedals consists of a device that is fastened to the floor board of the car at the rear of the high and low pedal. The device is in two parts; one part passes forward and carries a trip arrangement that catches back of the pedal when the pedal



is in the neutral position, while the second part projects to the right out at one side, acting as a release to loosen the catch when the operator desires to push the pedal into first.

This device is small, is easily attached to the floor board and is inconspicuous and in case of an emergency catches the pedal in neutral as the foot is pushed forward, preventing the operator from moving the pedal still further forward into first and causing a possible accident.

The neutral stop does not interfere with the regular operation of the car, but does act in case of emergency. The stop is made of high-grade material and will outlast the car upon which it is attached.

Manufactured by the S-W Manufacturing Co., Lynn, Mass. Price, $5, parcel post prepaid.

The Campbell Storage Battery is a new model, which the manufacturer has named the "Battery of No Regrets." After experiment and exacting research covering a number of years a battery has been designed which is claimed to overcome many faults of storage batteries in the past.

The grids are of a design possessing great strength and flexibility capable of taking and holding the proper charge and giving the correct discharge without undue harm to the battery. Grids are pasted by hand, pass under a rigid inspection; none but perfect plates being used in the construction of the finished batteries.

The jars are guaranteed to withstand a strain of 3600 pounds a square inch, much heavier than they will ever be called upon to receive, while the result is greater durability in service. Each jar is tested with an electric current of 36,000 volts, so that any leak or defective spot becomes apparent before the battery is assembled.

The separators are resawed Port Orford white cedar, each separator being rigidly inspected before being used. This wood has been proved to be the best for battery separator use, it is stated. Battery cases are made of select kiln dried oak, dove tailed, no nails or screws being used.

Treated and painted with acid proof paint.

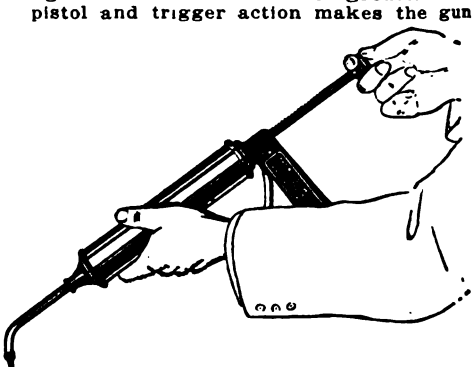
The battery post construction is such that it is stated it is impossible for them to become broken or to leak. Large vents are provided in the top of each cell through which distilled water may be added to the electrolyte or the electrolyte tested.

Campbell batteries are covered by a 12 months written guarantee, given the purchaser on the date of sale.

Manufactured by Campbell Electric Co., Inc., 1529-31 Wyandotte Street, Kansas City, Mo. Prices on request.

The Vital Automatic Grease Gun combines two devices in one, a pressure gun for heavy grease and oil operated by a trigger and pistol grip and a pump for light oils or gasoline actuated by pushing the plunger by hand.

The cylinder is made of the best of material and the caps, top and bottom are made of cast metal smoothed and polished. Two nozzles are furnished, one for light oil and the second for grease. The pistol and trigger action makes the gun



very easy to operate even with one hand. The cap on one end unscrews, so that the gun is easily loaded with grease, while the offset nozzle permits inaccessible places to be reached.

Manufactured by the Vital Manufacturing Co., Cleveland, O. Price $5.

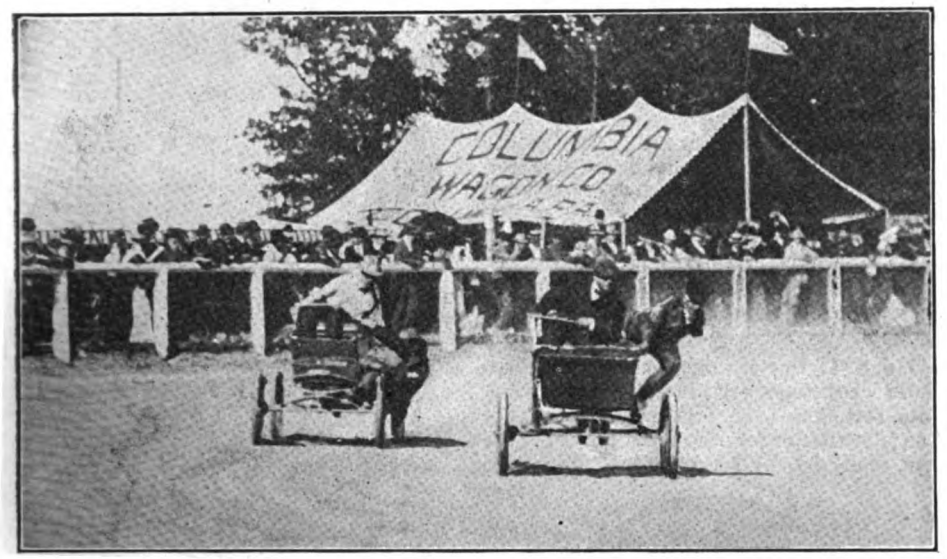
News of Racing Events and Recent Endurance Tests

THE accompanying illustration affords a glimpse of the racing game as it was in the earlier days of the automobile. In the right hand car is Percy Owen, now president of the Liberty Motor Car Co., Detroit, but at that time branch manager for the Winton company in New York City.



Percy Owen, Now President of Liberty Motor Car Co., Making a Fast Turn in Racing Event in 1903.

Mr. Owen was then an internationally known racing driver, holding world records in 1901 and 1902 for all distances from one to 10 miles. The picture here shown was taken during one of his races on Long Island in 1903. The figure at his left is the mechanician who, it will be noted, had to serve also as counterweight when rounding the turns at high speed.

AUTOMOBILE RECORDS FOR THE YEAR 1919.

Following is a list of important records made in racing events during the year just finished:

February 12—Ralph De Palma, at Daytona Beach, Fla., set two world speed records: One mile in 24:02. 149.87 miles per hour or 215.65 feet per second; one kilometer in 15:86.

February 16—Ralph De Palma, driving a Packard special 12-cylinder aviation engine of 905 cubic inches piston displacement, set these world records at Daytona, Fla.: Two miles in 49:54; three miles in 1:15:04; four miles in 1:39:77; five miles in 2:04:58; 10 miles in 4:09:31, and 20 miles in 9:21:41.

February 17—Ralph De Palma set these world records at Daytona, Fla.: Fifteen miles straightaway in 6:48:75; 20 miles straightaway in 8:54:20, and one mile, standing start, in 0:38:83.

March 15—Santa Monica, Cal., road race, 250 miles, won by Cliff Durant in 3:04:45; average of 81.6; E. Hearne second in 3:11:95; Louis LeCock third in 3:15:28, and Eddie Pullen fourth in 3:20:40.

May 19—Victory sweepstakes, 112 miles, at Uniontown, Pa., won by Tommy Milton in 1:10:09:32, average of 96½; Louis Chevrolet second and Ralph Mulford third.

May 31—Five hundred miles, $50,000 national sweepstakes, at Indianapolis; won by H. Wilcox, Peugeot, in 5:44:21:75, average of 87.12; E. Hearne, Durant, second, in 5:46:16:05; Jules Goux, Peugeot, third in 5:50:29:90; A. Guyot, Ballot, fourth, in 5:53:33:50, and Tom Alley, Bender, fifth in 6:06:54:85.

June 14—Results at Sheepshead Bay: Fifty miles, won by R. De Palma, Packard, in 26:23 1/5, average of 114.5; Joe Boyer, Jr., Frontenac Special, second, and Dave Lewis, Meteor, third. Ten miles, won by Tom Milton, Duesenberg Special, in 5:20 1/5; R. Mulford, Frontenac Special, second, and R. Resta, Resta Special, third. Thirty miles, won by Mulford in 16:20 3/10 (world record); De Palma, second. Ten miles, won by Mulford in 5:24 1/5; Boyer second and De Palma third.

July 4—Ralph Mulford won a 40-mile race at Tacoma, Wash., in 24:02 2/5; Durant second, Chevrolet third, Hearne fourth and Resta fifth. Louis Chevrolet won a 60-mile race in 36:47 1/5; Mulford second, Hearne third, Durant fourth and Resta fifth.

July 4—Gaston Chevrolet won a 100-mile race at Sheepshead Bay, N. Y., in 54:17⅛ (world record); Wilcox second and Dave Lewis third.

July 19—Tom Milton won a 22½-mile speed race at Uniontown, Pa., in 101.17 miles average per hour. He drove a Duesenberg; D. Lewis, Meteor, second, and Fetterman, Fecrless, third.

July 22—R. J. Copes, Denver, in a Chevrolet, won the Denver-to-Cheyenne road race, under the auspices of the Denver Times, in 2:11:59; Red Myers, Hudson, second.

August 23—Tom Milton, Duesenberg, won 301-mile Elgin road race at Elgin, Ill., in 4:05:17, average of 73.5. Roscoe Sarles, Roamer Special, second, and Kurt Hitke, Roamer, third.

October 12—Auto sweepstakes, 250 miles, at Cincinnati, won by Joe Boyer, with an average of 101.69. Art Kline, second, and Kurt Hitke, third.

November 8—Eddie Hearne won 100-mile free-for-all at Phoenix, Ariz., in 1:29:09 (claimed to be world record on dirt track); R. Sarles, second, and R. C. Durant, third.

INAUGURAL FOR NEW SPEEDWAY.

The inaugural event on the new speedway being built for the Los Angeles Speedway association, near Beverly, Cal., will be held on Feb. 22.

SEVENTH 500-MILE RACE AT INDIANAPOLIS, IND.

Entry blanks are out for the seventh International 500-mile race on the Indianapolis speedway on Monday, May 31. This will be the first of these important international contests to be held under the new speedway rules limiting the competition to cars of 183 cubic inches displacement, and is, therefore, anticipated with unusual interest both in the United States and abroad. Some modifications have been made since the preliminary conditions for the race were announced some time ago. The weight limit has been lowered from 1700 to 1650 pounds, this making the Indianapolis racing rules conform with those of the Grand Prix de France, scheduled to take place at Le Mans next fall. The right hand drive has been made optional instead of compulsory, left hand steering now being permitted also.

The prize money will be as in former years, with a total of $50,000 divided among the first 10 cars to finish, of which $20,000 goes to the winner. In addition, as has been customary, a number of tire and accessory manufacturers are expected to add substantial bonuses, payment being conditional upon the winner's using the manufacturer's equipment, so that the first prize winner may be reasonably certain of securing not less than $25,000 to $30,000.

The first entry for next May was again registered this year by Clifford Durant, the millionaire son of W. C. Durant, head of the General Motors Co. Mr. Durant wired his entry from Oakland, Cal., where he is having a special 183 cubic inch racing car made in the Chevrolet factory. He was also the first to enter the race last year, and was well up among the leaders until at the 150-mile post his steering gear gave way and he was forced to retire. He bears the title of Pacific coast champion by virtue of his victories in the 1918 Montamarathon and Potlatch contests at Tacoma, Wash., and the 1919 Santa Monica road race.

CLEVELAND "SIERRA PIONEER."

An "altitude" record was recently given the Cleveland Light Six car, made by the Cleveland Automobile Co., Cleveland, O., by its San Francisco dealer, Peacock, Alexander & Hunter Co. A member of the San Francisco organization drove a stock car up the Placreville lake road in the California Sierras to the summit of the highway, which is 7630 feet above sea level. The car finished with a perfect score and has been christened the "Sierra Pioneer."

Harry G. Thomas, driving Franklin touring car, made by the H. H. Franklin Manufacturing Co., Syracuse, N. Y., made a new record for endurance runs recently, under adverse weather conditions, by covering 532 miles in 13 hours and nine minutes, at an average speed of 40.45 miles an hour.

Officials of Hart-Parr Co., Makers of Farm Tractors

M. W. ELLIS, son of C. D. Ellis, president of the Hart-Parr Co., Charles City, Ia., has succeeded W. R. Dray, who for the past 2½ years has been vice president and general manager of that company, and a reorganization of the company has been effected. C. D. Ellis, who has been elected president and chairman of the board of directors, is president of the Security Trust & Savings Bank of Charles City; A. H. Witt, who has long been associated with the company, becomes secretary and assistant treasurer; W. S. Frederickson, general sales manager, came to the company five years ago as manager of local sales, and R. C. Rolfing, works manager, started in 1912 as assistant in the office of the superintendent.

C. D. Ellis, President and Chairman of Directors.

The Hart-Parr Co., which claims to be a pioner in the farm tractor industry, has a large plant at Charles City, now employing about 1000 men. Since the war the old type of tractor was abandoned and a new design has been developed, which has created a considerable demand.

W. S. Frederickson, General Sales Manager.

W. B. Jameson has been placed in charge of warehousing and buying for Bellanger Freres of Paris, France, with offices in the Bush Terminal, New York. All the buying for the Parisian concern has hitherto been done at the offices of Briscoe & Stahl, Detroit, and this new arrangement will relieve the Detroit office of the routine of this branch of its activities. Mr. Jameson has been connected with Mr. Briscoe in many of his enterprises in the past, was superintendent of the Maxwell plant at New Castle, Ind., and was later superintendent of the Chicago assembling plant of the Maxwell-Briscoe Co.

Hugh T. Porter, one of the foremost sales executives on New York's automobile row, has been appointed metropolitan distributor of the new La Fayette car, made by the La Fayette Motors Co., Indianapolis, Ind. Mr. Porter has had eight years experience in automobile merchandising, identified with high-grade cars, principally in the metropolitan district. He was first associated with the Locomobile Co. as New York sales manager, and about five years ago became sales manager for the Detroit-Cadillac Motor Car Co. Before entering the automobile business he was in the ordnance department of the United States government, stationed at the Sandy Hook proving ground. He was also associated with the Western Electric Co. both in New York City and Atlanta, Ga., studying electrical engineering at the Georgia Institute of Technology. He is a resident of Greenwich, Conn.

M. W. Ellis, Vice President and General Manager.

F. S. Bacon has been appointed southwestern district sales manager for the Acason Motor Truck Co., Detroit, with headquarters at Fort Worth, Tex.

Charles Drum, in charge of the Buick Motor Body Co., is to become factory manager of the Hayes Manufacturing Co., Detroit. Other changes in the Hayes personnel, effective Jan. 15, are as follows: Harry Deering to have charge of production in the sheet metal plant; A. T. Wieland, formerly in the body department of the Pierce-Arrow Motor Car Co., superintendent of body plant; L. B. Griffin, formerly in the sales department, secretary to the president; Godfrey Strellinger succeeds Mr. Griffin in sales department.

A. H. Witt, Secretary and Assistant Treasurer.

C. M. Wallace, formerly with the purchasing department, body division, of the Packard Motor Car Co., has joined the Standard Motor Truck Co. as purchasing agent. The automotive experience of Mr. Wallace began with the Buda Co. as purchasing agent, and later he joined the Mitchell Motors Co. as assistant purchasing agent.

W. C. Rolfing, Manager of Works.

CALENDAR OF COMING EVENTS

Jan. 26-27—Chicago, Ill., Third Annual Members' Meeting, National Automobile Dealers' Association, La Salle Hotel.

Jan. 26-31—Amsterdam, N. Y.; automobile show, benefit of Co. H, N. Y. State Armory, Amsterdam, N. Y.

Jan. 26—Elmira, N. Y., Annual Meeting, Auto Trade Association.

Jan. 27—Atlanta, Ga., Annual Convention, Georgia Automobile Dealers' Association.

Jan. 27—Chicago, Ill., Annual Meeting, Congress Hotel, National Association Automobile Show Managers.

Jan. 27-30—Louisville, Ky.; convention Kentucky Hardware and Implement Dealers' Association.

Jan. 27-30—Portland, Ore.; convention, Oregon Hardware and Implement Dealers' Association.

Jan. 28—Chicago, Ill., Truck and Tractor Meeting, Society Automotive Engineers.

Jan. 28-31—Louisville, Ky.; Kentucky Hardware and Implement Dealers' Association; M. J. Stone, secretary.

Jan. 31-Feb. 7—New Brunswick, N. J., Annual Automobile Show, Armory, W. A. Kuehn, manager.

Jan. 31-Feb. 6—Kansas City, Mo., Motor Car Dealers' Show, Overland building. E. E. Peake, manager.

Jan. 31-Feb. 7—Minneapolis, Minn., Twin City Automobile, Truck, Trailer and Industrial Exposition, Minneapolis Automobile Trade Association. Walter R. Wilmot, manager.

February—Chicago, Ill., International Automobile Managers' Congress.

February—New York City, Marine Motors Meeting, Society Automotive Engineers.

February—Deadwood, S. D.; annual show, Deadwood Business Club; F. R. Baldwin, manager.

February—Montreal, Quebec, Dealers' Show.

February—Manchester, England; North of England motor exhibition.

Feb. 2-7—Kansas City, Automobile Show.

Feb. 2-7—Toledo, O., Car and Truck Show, Terminal Auditorium, Toledo Auto Shows Co.

Feb. 3-7—Baltimore, Md., Car Show, Fifth Regiment Armory, Baltimore Dealers' Association.

Feb. 9-11—Wichita, Kan, tractor and farm machinery forum, Wichita Thresher-Tractor Club.

Feb. 9-13—Louisville, Ky.; annual show and convention, American Road Builders' Association; 10th annual good roads congress; 11th annual good roads show.

Feb. 3-13—Charlotte, N. C., Show of the Carolinas. Lee Folger, chairman, show committee.

Feb. 9-14—Nashville, Tenn.; Annual Show, Nashville Auto Trade Association.

Feb. 9-14—Kansas City, Mo.; Fifth Annual National Tractor Show, Kansas City Tractor Club. Guy H. Hall, manager, Sweeney building.

Feb. 10-14—Greenfield, Mass.; automobile show, benefit of Co. A, Massachusetts State Armory, Greenfield, Mass.

Feb. 10-14—Quincy, Ill.; Second Annual Automobile Truck and Tractor Show.

Feb. 12—Kansas City, Mo., Tractor Meeting, Society Automotive Engineers.

Feb. 14-21—Brooklyn, N. Y., Ninth Annual Brooklyn Automobile Show, 23rd Regiment Armory, Brooklyn Motor Vehicle Dealers' Association.

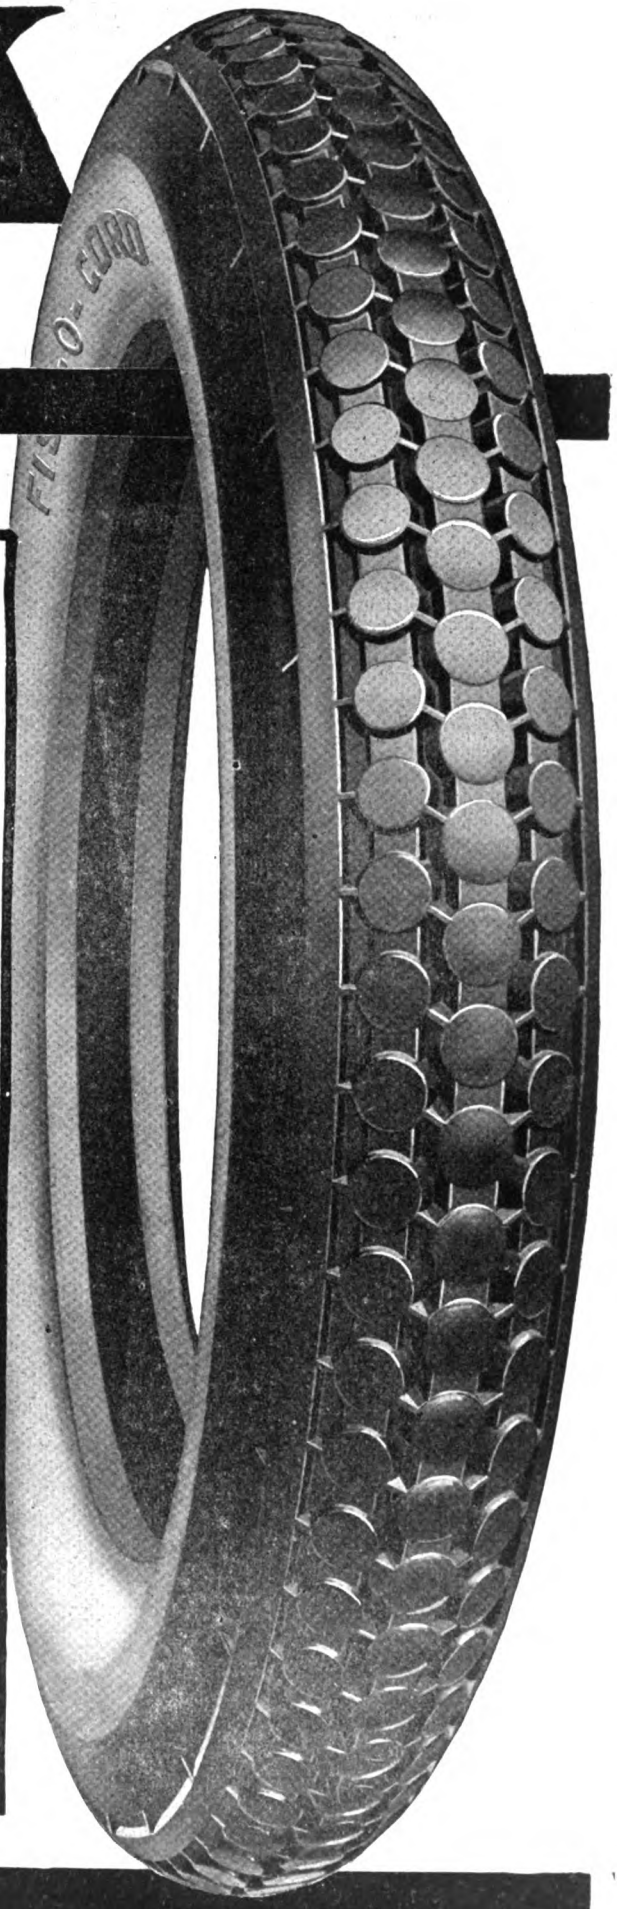
FISK TIRES



THE Fisk Black Tread Non-Skid is the best dollar-for-dollar value on the market, bar none.

The Fisk Cord represents the very peak of "cord" workmanship.

And the Fisk Red-Top—between the two in price, and, with its extra heavy tread and extra ply, actually without a rival in the tire world—is the wonder of the trade.

Investigate. You'll find ***completeness*** only in Fisk.

Next Time—BUY FISK

Sold ***direct*** to dealers and manufacturers. There is a Fisk Branch within 24 hours of any dealer.

RECORD SHIPMENT OF REO TRUCKS TO FORT WORTH, TEX.

The great demand for motor trucks in Texas is shown by the fact that the first railroad train composed exclusively of motor trucks to be transported for any considerable distance, was dispatched from Lansing, Mich., to Fort Worth, Tex., by the Reo Motor Car Co. the latter part of November. This was composed of 29 cars, was loaded with 100 Reo Speed Wagons and was sent out as a "through freight" direct from Lansing to Fort Worth, consigned to the Stapleton-Brown Motor Co.

The accompanying picture shows the huge banners which were attached to the sides of the cars as they pulled out of the Reo yards.

LIBERTY'S CHICAGO DEALERS.

McShane-Hill, Chicago agent for the Liberty car manufactured by the Liberty Motor Car Co., Detroit, has purchased the property at the northwest corner of 25th street and Michigan avenue, where it will erect a two-story automobile salesroom and service building. The frontage is 40 feet and the depth 112 feet, and it is planned to have it ready for occupancy by the first of March. The McShane-Hill concern has contracted for a large allotment of Liberty cars for 1920 and in order to fully carry out its policy of giving the utmost in service, finds its present quarters at 2250 Michigan avenue inadequate.

VESTA EMPLOYEES TO BENEFIT BY PROFIT SHARING.

The Vesta Accumulator Co., Chicago, maker of Vesta storage batteries and electrical equipment, has put into effect a new plan of sharing with its employees whereby the profits will be distributed each year at New Years, beginning with this year.

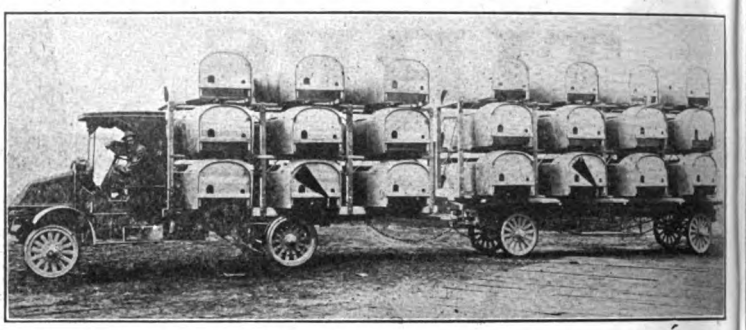
The profit sharing idea is not new with the Vesta company, but it has heretofore been done on the basis of a percentage of each year's profits. The new plan puts the matter on a more definite basis, based upon the length of time the employee has been in the service of the company. It starts by apportioning an amount equal to one per cent. of salary to all employees who have worked less than one year, and each succeeding year that the employee remains in service an additional per cent. is added until a maximum of 10 per cent. is reached for 10 years' service.

Many of the Vesta company's employees were engaged in military activities during the war and the percentage of these has been figured so as to give them credit for all the time they were in government service.

Hauling Truck Bodies by Trailer Found Economical by Westcott Motor Co.

J. S. WAGNER Transfer & Storage Co., Springfield, O., is a trucking concern which, to meet a particular haulage need, has just purchased from the Troy Wagon Works Co., Troy, O., a three-ton trailer with a 22-foot chassis for use in connection with a truck which has a body equipped with special racks.

During the recent freight congestion, the Westcott Motor Co. of Springfield had great trouble in getting bodies from Muncie, Ind., as oftentimes the bodies were a week on the way when sent by rail. To meet this condition the Westcott company called to its aid the Wagner Transfer Co., and the accompanying picture shows the truck and trailer outfit loaded with 21 light six Westcott touring car bodies, the number that could be loaded on a 40-foot railroad car. These bodies were transported from the Westcott body factory at Muncie, to Springfield, an approximate run of 100 miles each way. The round trip is made in 20 hours, this including loading and unloading time. The average hourly mileage is 15 miles. This makes a saving in time of six days.



Tractor and Troy Trailer That Hauls Loads of 21 Auto Bodies from Muncie, Ind., to Springfield, O.

In bad weather the bodies are protected by a large canvas envelope, which fits closely over the loads on both truck and trailer. The bodies average to weigh 500 pounds each, making the total load for truck and trailer 10,500 pounds, but in this case it is the bulkiness rather than the weight which governs the amount of the load.

The traffic manager of the Westcott company states that while it costs a little more to ship these bodies by truck and trailer than by railroad, the fact that deliveries are promptly made more than offsets the extra expense.

CAPITAL INCREASED.

The capital of the Western Die & Stamping Works, 720 Fulton street, Chicago, has been increased from $7000 to $12,000.

The Curtiss Southwest Airplane Co., Tulsa, Okla., manufacturer of aircraft, announces an increase in capital from $10,000 to $200,000.

The Chicago Steel Tank Co. has increased its stock to $25,000.

India Tire & Rubber Co., Akron, O., from $1,500,000 to $5,000,000.

CROFOOT GEAR WORKS BUYS LARGE PLANT.

The Crofoot Gear Works, Inc., Cambridge, Mass., has purchased of the Mason Regulator Co., Dorchester, a large plant containing approximately 50,000 square feet of floor space and about 87,000 feet of land on Hyde Park avenue in the Hyde Park district of Boston.

The Crofoot company will occupy these premises early this year and will, it is understood, employ 200 hands. This factory is considered one of the finest industrial plants in Boston, being of first class construction and equipped with every modern convenience. The cost of construction was more than $200,000 and the purchase price is said to be near that figure.

Train Load of Reo "Speedwagons," Said to Be the Largest Single Shipment Ever Made, Leaving Lansing, Mich., for Fort Worth, Tex. The Train Carried 100 Machines.

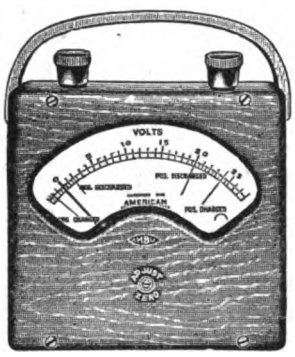
AMBU BATTERY SHOP NECESSITIES GO HAND IN HAND WITH INCREASED PRODUCTION AND GREATER PROFITS

KNOW WHICH SET OF PLATES ARE IN BAD CONDITION WITHOUT OPENING BATTERY

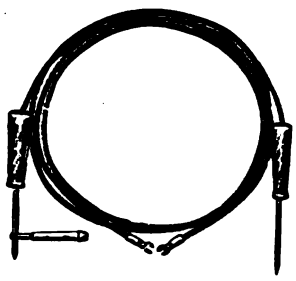
AMBU CADMIUM VOLTMETER AND LEADS TELL YOU QUICKLY



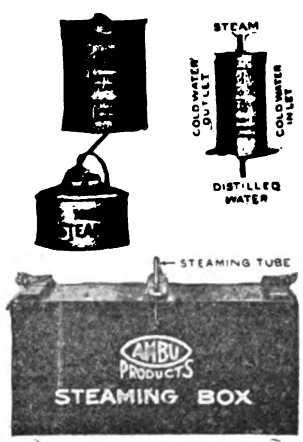
Ambu Cadmium Leads are two heavily insulated flexible wires with brass prods and wooden handles, and forked terminals for attaching to the voltmeter. Fastened at right angles to one of the brass prods is a rod of chemically pure cadmium. With them you have the means to make tests in finding out which set of battery plates is functioning properly and whether they are positive or negative plates. No Battery should be sent out of your shop until a Cadmium Test shows that both positive and negative plates are fully charged and ready to give good service.

In order to make accurate Cadmium Tests you must have a fine reading Voltmeter.

The AMBU CADMIUM VOLTMETER is made especially for Cadmium Tests, and is, therefore, absolutely certain to give you accurate results. A complete instruction book for making Cadmium Tests goes with each instrument.



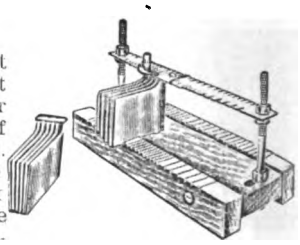
Voltmeter with Cadmium Leads.....$25.00
Voltmeter, only..... 22.50
Cadmium Leads, only..... 3.25



AMBU BATTERY STEAMER

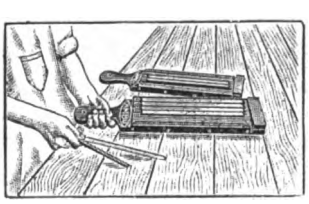
Softens the sealing compound in a few minutes so that it can be easily removed. Works while you are busy elsewhere. No chance to burn the battery top cover as with a flame. Supplied either with or without condenser for making distilled water for batteries. Type "A," with steaming box, $52. Type "B," steam direct into cell, $25. Condenser with either of above, $12.50 extra.

AMBU PLATE BURNING RACKS



Holds plates at exactly right spacing and absolutely upright when burning in new ones or attaching new strap. Saves half the time of any other method. Attachments fit around plate lugs permit puddling lead. No iron touches the bottom of the plates. Made in two sizes—smaller one takes two groups—⅛-in. and thin plates—and large size takes 95% of all types, including the two sizes cared for in the small rack. Every shop needs these. Small size $7.50. Large size $12.50.

AMBU BURNING LEAD MOULD



In every shop there is an accumulation of scrap lead from old plates, post drillings, etc. Save this scrap and use it in lead burning. The Ambu Lead Mould gives a very handy sized burning lead, absolutely free from air holes.

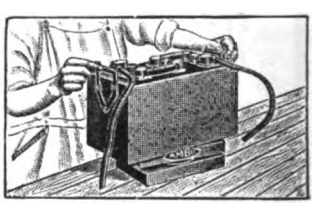
Price, each.....$1.50
Price, per pair..... 2.50

AMBU BATTERY CARRIER

Enables you to carry a battery like a suitcase, with the least strain on your arms. One man can carry two batteries at once, one in each hand. Also useful in lifting battery in and out of the car.

Price, each.....$1.50
Price, per pair..... 2.50

AMBU BATTERY TURNTABLE



Nobody moves a battery around unnecessarily on account of its great weight. Yet, in lead burning, sealing and repairing or painting the case, it is necessary to get at all sides of the battery. The Ambu Turntable enables the repairman to get at all sides of a battery when making repairs and eliminates the tiresome lifting and turning by hand.

Price, each.....$2.50

To Wholesale Tire Distributors

We want the one best WHOLESALE TIRE DISTRIBU in each territory not now occupied, to write for ou clusive proposition!

To Retail Tire Dealers

Our new plan of having a factory branch—or an exclu wholesale distributor in every important trade center ables you to get STERLING TIRES when you v them—and at our best factory price.

Why are STERLING TIRES *so dependabl*

Twelve years of successful experience!
Highest quality material—and plenty of it!
A sincere desire to make the best tire possible!

LONG experience alone is not a sufficient guarantee that a tire will be made as good as it is possible to make it.

Highest quality of material and plenty of it is necessary to make a thoroughly dependable tire, but even this added to long experience, will not insure long life in a tire—and satisfaction to the user.

Experience counts for much, and good materials are essential; but the one thing that crystalizes both these factors and develops them into a good tire, is the earnest desire of the manufacturer—and each individual workman, to put *"Sterling Conscience"* and *"Sterling Character"* and *"Sterling Dependability"* into every STERLING TIRE!

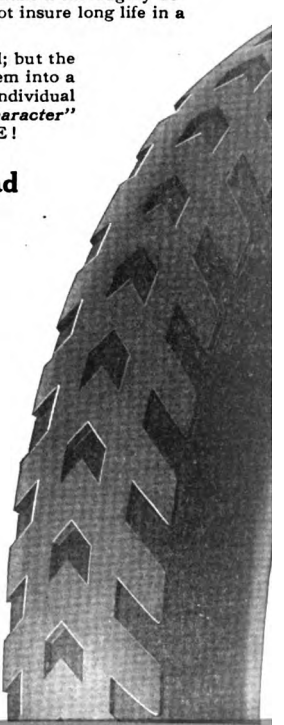
Vacuum Tread, Non-Skid -:- Plain Tread

Cords and Fabrics

STERLING CORDS have never been excelled by any cord tire made—and seldom equalled.

STERLING FABRICS are like old friends; they are dependable.

STERLING SEAMLESS RED TUBES are made of pure gum. A section will float in water. Only the highest quality of pure rubber will float.



Sterling Tires

STERLING TIRE CORPORATION
Rutherford, New Jersey, U.S.A.

Foreign Trade Mark Piracy Cases

THE American Manufacturers' Export association, through its patent and trade mark committee, has taken action with a view to bringing about relief in the serious situation of trade mark piracy. Acting with the National Automobile Chamber of Commerce, an appeal has been sent to the state department at Washington asking the United States ambassador at Portugal to protect the interests of those manufacturers whose trade marks were appropriated by Manuel Silva Carmo of Oporto, Portugal. This, under Portuguese law, he is entitled to do, although it is indicated that an opportunity is granted for the interposition of objections by any whose interests may be injured.

The American Manufacturers' Export association has repeatedly warned exporters of the danger of doing business without protecting their trade marks. The Portuguese registration of American trade names was discovered by an international patent attorney upon his attempt to register the names Jordan and Mercer at Oporto. Not alone was it found that these names had already been entered for registration by Carmo, but that a long list of others was equally endangered, so far as their real owners are concerned. Among those reported by cable are: Chandler, Bartholomew, Velie, Cole, Grant, Chalmers, Paige, Auburn, McFarlan, Saxon, Kissel, Dorris, Stutz, Mitchell, Moline, Hackett, Maxwell, Monroe, Chevrolet, Lexington, Winton, National, Stearns, Westcott, Hal, White, Moline Plow, Jackson, Haynes, Elkhart, Oakland —in all there were 43.

The pirating of American trade marks is not limited to any particular country. Hundreds of American trade marks are appropriated throughout the world. Only recently the registration of the words "India Rubber" as a trade mark in Argentina was successfully opposed. If this trade mark had not been registered it would have enabled the person who registered this mark to confiscate any goods shipped into Argentina marked with the words "India Rubber."

Only a few weeks ago an attempt was made in Spain to register the trade mark "Peerless," "Selden" and "F. W. D." for automobile trucks, "Corona" for typewriters, "3-in-1" oil and "Havoline" for lubricants. In Cuba, within the last month, "Diamond Grid" for storage batteries, "Kirschbaum" clothes, "Fashion Park" cloth, "Kissel Kar" and "McFarlan;" "Commerce Trucks" in Uruguay; "Coca-Cola" in Japan; "A. C." spark plugs in Japan; "Marmon" and "Stutz" in the Argentine Republic. The list could be added to indefinitely.

It is stated, however, that in view of the patent and trade mark provisions of the peace treaty, it will be possible upon ratification of the treaty to recover all the trade marks pirated in Portugal, owing to an extension of the International Trade Mark convention, to which this country is a party.

AN ENGLAND WITHOUT RAILS.

Brigadier-General Charles B. Drake, chief of the United States army motor transport corps, predicts that England is destined within a few years to become "a nation without railways, or with railways supplementing a highly developed system of motor transportation." This forecast can be made with reason after a study of the recent railway tie up in England.

"Because of the efficiency of the system of transportation by motor that was devised under the compulsion of necessity," says General Drake, "the life of the nation was not thrown out of joint entirely and the strike itself, in consequence, fizzled out."

CARS IN THE PHILIPPINES.

During the past year of record there were 4326 cars of 144 different makes registered in the Philippine bureau of public works, which has the oversight of the licensing of motor vehicles in those islands. Considering the most popular car from the viewpoint of passenger capacity, the five-passenger car stands far in advance, with a total of 2153 cars. The seven-passenger ranks second with 1171 registrations; next in order come the two-passenger, 459; four-passenger, 181; eight-passenger, 108; three-passenger, 107; six-passenger, 94; 10-passenger, 37; nine-passenger, 16.

WILL DEAL IN AUTOMOBILES.

The Eagle Star & British Dominions of London, England, is to open an automobile department through its United States manager, Fred S. James & Co.

Canadian Programme of General Motors

The General Motors Corporation is extending its Canadian construction programme. The already extensive building operations now in progress at Walkersville, Ont., is being expanded to permit of the manufacture of transmissions. Howard E. Blood, general manager of the Canadian Products, Ltd., the Canadian subsidiary of the General Motors Corporation, recently announced that an additional department will be added at Walkersville to those already planned. Plant No. 1 will be used for the manufacture of automobile motors and for office space. Plant No. 2 will be used for production of axles and tools.

The plants are of most modern construction. There is being shown an increasing tendency to make more desirable working conditions and the Canadian Products plant is an outstanding example of this. A lighting system of maximum efficiency is being installed throughout the various buildings, and in addition to this, ceilings and structural supports are painted white. Ventilation is also provided along scientific lines. The power and heating plant, costing approximately $175,000, is nearing completion. Construction of huge oil tanks to hold 60,000 gallons is under way at the rear of plant No. 2. A maintenance building for the repair of electric motors and plant equipment will be built.

The Walkerville site is 38 acres in extent. The expenditure there is estimated at $6,000,000, and the entire appropriation of the corporation for extensions this year in the United States and Canada was $37,398,000.

MOTOR ROAD FOR BRAZIL.

An improved automobile road is being constructed between Rio de Janeiro and Petropolis, Brazil, and this highway, 25 miles long, is expected to prove one of the most popular drives in South America, as it affords fine panoramas of the surrounding country.

Cuba is discarding the historic two-wheeled mule cart for the American motor trucks in connection with the big sugar industries.

FREE
CURTIS AIR
FREE FROM OIL

The Curtis Sign is 10x14 inches—baked enamel on steel. Furnished FREE with every Curtis Garage Air Compressor—can not be had in any other way.

Curtis Free Air Service Brings You New Patrons and Increased Profits

It is generally recognized that compressed air to fill tires frequently carries oil and that this oil has a deteriorating effect on inner tubes. For this reason motorists are discriminating in their use of "free air service"—and are on the lookout for the Curtis sign because they know that Curtis Air is free from oil. It may be that the installation of the CURTIS outfit will be the beginning of a new era of profit-making for you.

Curtis Air—Free From Oil

Curtis Air Compressors, through a patented construction, prevent oil from getting into the air line—therefore the air delivered is clean, pure and free from oil. The many other exclusive points of superiority, together with the simplicity, sturdiness and dependability of Curtis Compressors make them the popular choice everywhere. With the two new outfits illustrated—Style "Y" and Style "Z"—the Curtis line is now complete, offering a suitable compressor to meet every requirement. Ask your jobber or write us for illustrated literature describing the different sizes and types of outfits.

A Ford Controlling Itself

The Over-land Guide PATENTED *Controlling* the Ford

The OVER-LAND GUIDE Will Do It

When a Ford car or truck is equipped with the Over-Land Guide the driver can steer the vehicle with the tips of his fingers.

Over rocky or hilly roads, through sand or gravel, mud holes or washouts on city streets or rutty country roads the Over-Land Guide will keep the wheels in alignment.

It protects the entire front system and steering mechanism and the steering gears up to the wheel from undue wear and breakage. It will save parts and repairs and insures the longest possible service life of any Ford car or truck.

It will eliminate the danger of ditching and collision with the possibility of fatal results to the occupants and the destruction of the car even though the steering mechanism be broken or failed to work.

There is no danger from a blowout of a front tire even though the Ford car or truck is driven at high speed, as the Over-Land Guide will hold the machine to its course.

The Over-Land Guide stops the wabbling, scooting and creeping of the front wheels. There is no strain on the arms or shoulders of the driver. It does away with the strain and stresses on the steering mechanism. It saves time. It is life and car insurance of the highest order and affords a degree of security that makes it worth a hundred times the cost to any owner.

It is strongly made, neat and compact, requiring no upkeep. It will last longer than the car or truck and always saves and serves. It will not get out of order or fail to operate properly.

THERE IS NO EQUIPMENT MADE FOR THE FORD CAR OR TRUCK THAT IS MORE PRACTICAL OR NECESSARY. NONE THAT PROTECTS SO MANY PARTS AND SAVES SO MANY REPAIRS. THERE IS NONE THAT ADDS SO MUCH TO SAFETY AND SERVICE. ESTIMATE THE SAVINGS, ADDED EFFICIENCY AND PROTECTION AND YOU WILL AGREE THAT THE OVER-LAND GUIDE SHOULD BE ON EVERY FORD CAR OR TRUCK.

The OVER-LAND GUIDE protects these parts against breakage, undue wear and repair. Spindle connecting rod (or tie rod.) Spindle body arms and bushings. Spindle body and bushings. Ball and roller bearings and hub. Steering connecting rod and ball joints. Steering gear ball arms. Steering post bracket, bushing and bolts. Steering post. Steering gear pinion. Steering gear drive pinions. Steering gear internal gear case and bushings.

Also helps to keep axle from breaking or bending—and may save the entire car from destruction.

JOBBERS AND DEALERS:—The Over-Land Guide is a wonder seller. The sales are limited only to the number of Ford cars and trucks in use. Sold under an iron clad guarantee. It is priced right and the discounts are liberal. Write today for proposition and discounts.

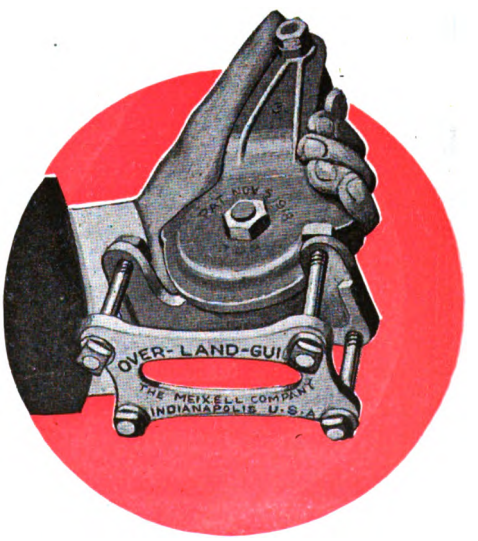
THE MEIXELL COMPANY

216 Board of Trade Building, INDIANAPOLIS, IND.

Automobile Sundries Co., 18 Broadway, New York, N. Y. Sole Foreign Agents.)

THIS BROAD GUARANTEE IS PART OF EVERY SALE.

The Over-Land Guide properly installed (which only takes a few minutes) is guaranteed to do all we claim. Your customers can use it for twenty days, and if at the end of that time they are not satisfied, money will be refunded upon its return.



The OVER-LAND GUIDE bolts to the center of the front axle and the center of the spindle connecting rod (or tie rod), securely relieving the vibration and strain in the spindle connecting rod (or tie rod) and the entire front system, and the steering mechanism up to the steering wheel. Can be attached in a few minutes by anyone.

A Ford Radiator of Great Strength and 42% Greater Cooling Capacity

FIGURE what greater strength, less weight and a 42% larger cooling capacity will mean in the day-in and day-out running of your Ford.

The Modine SPIREX radiator for Ford cars, because of its peculiar core construction, has a far greater cooling capacity than any other radiator of equal size. In addition, this core reinforcement gives it great strength and durability.

The SPIREX eliminates all boiling and over-heating troubles and cuts the care of your radiator to an occasional filling.

You can also get a special SPIREX for Fords that has a 67% larger cooling capacity.

Replace that old, troublesome radiator today with a Ford SPIREX. Ask your dealer about it or write direct to us.

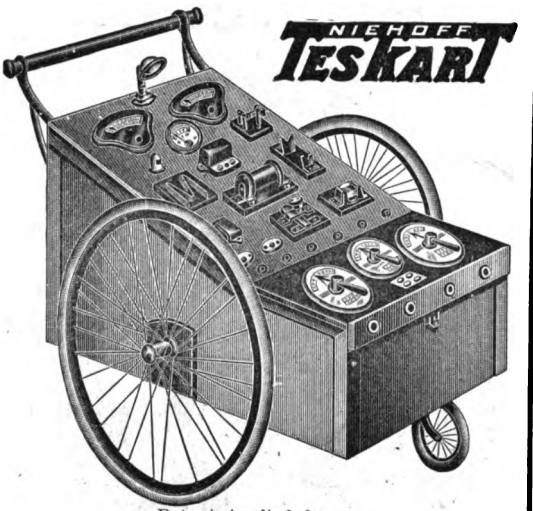
Niehoff Automotive Repair Shop Equipement



Patent Applied for

The NIEHOFF TEST KART is the latest achievement in the way of a complete Testing Outfit for locating all electrical trouble in the ignition, starter, generator, battery, wiring, relays, meters, in fact anything in connection with the electrical mechanism of an automobile. It will also recharge Ford magnets on the car. This outfit is a necessity in every repair shop. With it you can render a service to the motorist that will insure you increased business. It will enable you to inform the motorist intelligently, just what has to be done and give him an estimate as to the approximate cost.

The NIEHOFF TEST KART is the ideal rig for the general automotive garage service station. Price, **$850.00.**

We list below a few other important testing outfits.

Niehoff Defectometer—For testing magnetos and coils. Price, **$50.00.**

Niehoff Generometer—For locating shorts in starting and generator armature. Price, **$55.00.**

Niehoff Mag-Charger and Testing Outfit for Fords—Will recharge Ford magnets on the car, burn out shorts, test coils, spark plug, voltage of magneto, etc. Price, **$60.00.**

Niehoff Growler—To test armatures. Price, **$30.00.**

Niehoff Laminated Magnetizer—To recharge all sizes of magnetos for automobiles.
Storage Battery model. Price, **$25.00.**
110 D. C. Current model. Price, **$30.00.**

Niehoff Power T. B. Test Bench—To test generators and magnets after assembled.
Complete with motor. Price, **$650.00.**

DUNTLEY

MAGNETO BREAK

TIMER

The positive make and break contact of the Duntley magneto break timer embodies an individual magneto break to each cylinder that causes a clean, strong, hot, fat spark, which makes starting easy, and adds pep and power to the motor.

With the new Duntley magneto break timer you are assured perfect ignition 100% of the time, because

It is self-cleaning.

It requires no lubrication.

It has no whirling contacts to jump over a metal segment and wear out or become insulated with oil.

It is equipped with genuine tungsten points that will not corrode, pit or burn out.

EVERLASTINGLY GUARANTEED TO ALWAYS MAKE GOOD

Dealer write for our proposition today, it is mighty interesting

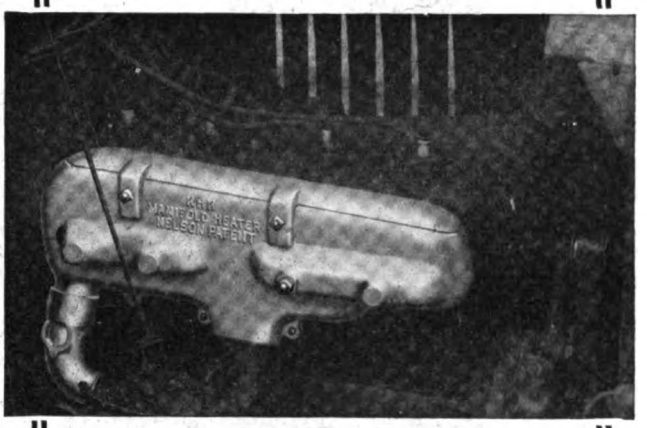
A PROFITABLE OPPORTUNITY



Get Your Share of these Cold Weather Profits

Now's the time to cash in on the profitable opportunity offered in the sale of K H K Manifold Heaters to Ford owners.

It fits over the regular Ford manifold holding the heat from the exhaust around the gas intake, keeping out the cold air and preheating the gas so that every particle is vaporized and exploded regardless of the quality of the gas.

Actual tests have shown a gas saving ranging from 15% to 30%. The resulting increased power is really remarkable.

The K H K Manifold Heater can be attached or removed by anyone in ten minutes to suit weather conditions. It is well made and its appearance adds to its sales value. Ask your jobber's salesman about the

K H K Ford
MANIFOLD HEATER

Or write direct for literature and attractive dealers' discount.

Every Ford owner should read "Transforming the Ford." Tells how to secure smooth, positive brake action that no car can excel. A little "transforming" and your car will glide to a quick, quiet stop without the annoying, irritating clatter that you now experience. It will go into low or reverse without jumping or jerking, and you can pick up speed with all the smoothness and ease of a high-priced car. All accomplished without additional expense and the result is a clear saving of 75 per cent. in one direction alone. "Transforming the Ford" tells how it's done. Send for your copy this very minute. 10c stamps or coin. **CORMACK CO., Dept. 57, 500 Fifth Ave., New York City.**

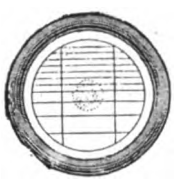
Completely Overcomes Glare— Waste of Light – Danger.

The Safest Lens for Dealers - - The Safest Lens for Motorists

Any good law that helps make motoring better and safer means good business for the dealer. You, as a good dealer, ought to welcome the anti-glare laws passed for the good of motoring. You can make these laws profitable by handling the right kind of lens. And the best lens from the motorist's point of view, as well as your own is



THE NEW

OSGOOD LENS

CRAVATH LONG DISTANCE TYPE

No Glare
No Dimmers
74% More Road Brightness Rays Thrown 1/3 of a Mile.
Never More Than Waist High.

Write for our proposition.

This is the lens that makes the road safe by giving 74% more road brightness just waist high for one-third mile ahead. It throws the rays forward and downward without glaring into the faces of people coming head-on.

By stocking the Osgood Lens you save yourself the nuisance and grief of carrying a bewildering assortment of different sizes and different makes, and the Osgood is the one lens that meets every requirement of the law, fits every car and every size.

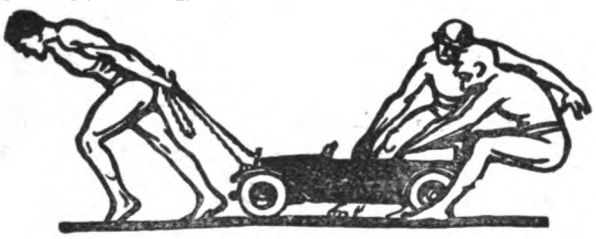
Another thing, complete stocks of Osgood Lenses are now on hand and ready for instant delivery. Prices, $2.90 to $4.50, according to size.

You have all the sales arguments on your side if you handle the Osgood. It outsells all others combined because it does not waste the light like colored glass or cut it in two like old-fashioned dimmers.

With the Osgood in stock you've got the goods and you're ready for all comers. And the prices are right, and your profits are right. Clean stock, quick delivery and complete satisfaction.

These are the facts and the arguments that have made the Osgood Lens the best lens proposition from the dealer's side of the fence throughout the country.

Osgood Lens & Supply Co., Mfrs. Harris Trust Bld., Chicago



TAKE CARE OF THE GO-BETWEENS

Transmissions and differentials are the go-betweens in the constant fight of **Power** against **Resistance.** Here the battle takes place—where the two forces meet.

DIXON'S GRAPHITE Transmission and Differential LUBRICANT

is made specially to meet a difficult lubricating problem like that.

It stands to its post under the tremendous pressure that must be met and conquers in this gruelling work.

It stays on the gears as faithfully when they are not moving as when they are in action.

They will build better lubricating business for you and satisfy your customers.

TEN Reasons Why The A1 Battery Charging Clip is Superior

1—Made of the highest grade acid resisting BRONZE.

2—LEAD COATED, adding additional protection from the acid.

3—The only 1 piece clip—gives absolute conductivity to both jaws.

4—No springs to break and allow clip to fall over and short circuit battery or open charging circuit.

5—The pointed teeth insure positive connection.

6—Jaws of clip open 1¼". Capacity 50 amperes.

7—The long legs allow clip to be used on batteries where connections are close together without danger of shorting.

8—Has a perfect terminal for wire connection which also protects wire from corrosion.

9—The long screw for wire connection acts as a stop, thus limiting the amount of pressure on the hinge of the clip and insures lasting tension.

10—Will outlast other clips several times.

PRICES: Less than 10, 25c. 10 to 100, 23c. 100 or more, 21c.

Positive Proof of How It Fires

Just Show Him The Famous "Lead Pencil" Test

This simple demonstration will instantly convince even the most skeptical motorist that **Twin Fires** will banish all his troubles with spark plugs.

Take any lead pencil and you can convincingly prove to the troubled motorist that **Twin Fires** give two independent sparks—entirely different from any other spark plugs.

This test will prove to his sense of sight that with **Twin Fires** he will always get two distinct, hot, fat, and instant sparks—that if dirt, oil or carbon clogs one point—the other point continues to fire.

Show Him Twin Fires—Then You'll Equip His Engine

The handy **Twin Fire** demonstration outfit enables you to prove how this plug overcomes troubles from oil and from carbon, and how it increases power. When the motorist sees this he wants you to sell him a set.

Dealer Plan Sent to You On Request.

Give the Motorist What He Wants

Public approval is the soundest possible basis upon which to build your business. For upward of 30 years we have been pre-eminent throughout the world in the manufacture of Electrical Measuring Instruments. Today, the

Weston. Model 354 **Ammeter**

which is advertised through the national publications with circulations totalling into the millions, is used on a very large percentage of the highest-grade domestic and foreign cars. You will increase your reputation and your trade if you install this standard Instrument on the cars of your customers.

The Weston Ammeter furnishes the driver the only absolutely reliable means of knowing whether his generator is working properly and his storage battery receiving its proper charge. Write us—don't fool with inferior substitutes!

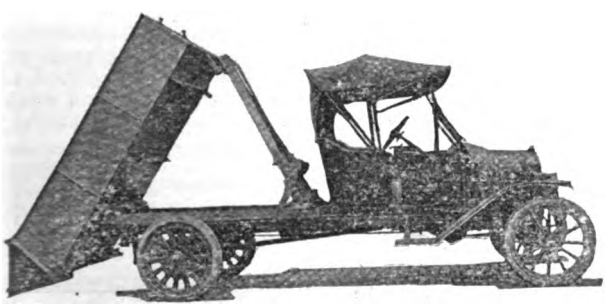
THE PEERLESS HAND HOIST

Single Cable Quadruple Worm Gear Drive

For Any Make or Type of Truck.



A wonder in efficiency and speed. It will fit any chassis and body. Weighs but 200 pounds. Simple, fool proof, wholly dependable and will last for years in the hardest service.

Any one that can drive a truck can hoist the heaviest load to 30 or 50 degrees in the longest body in less than two minutes. The smaller the body and load the quicker the action.

But two gears are used, quadruple worm and gear (both machine cut) and housed to protect from dirt and dust. The single cable makes an even pull. Compact and can be installed without drilling holes in chassis frame. The body hitch is also furnished.

We specialize in building all-steel bodies for any need.

Write for complete information.

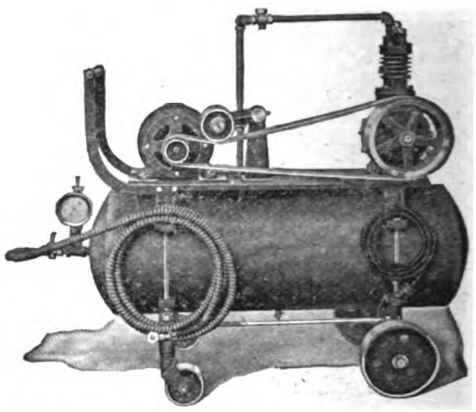
GARDNER AIR PUMPS

Result of 50 years manufacturing experience.

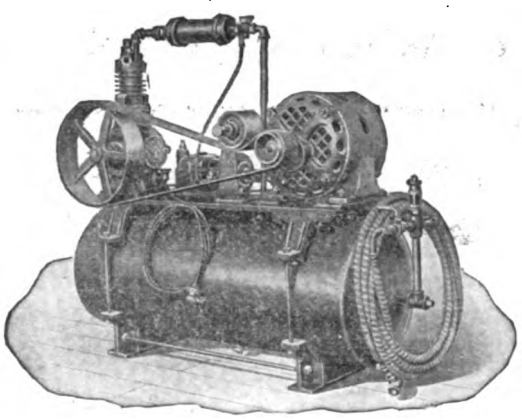
An inefficient air pump makes your air service expensive.
It hurts the quality of your service.
Makes a customer dissatisfied and hurts your business generally.

Install a GARDNER

It will pay for itself in a short time.
It is simple, rugged and efficient.
The fact that many filler stations supplying hundreds of car owners daily use the Gardner air pump is proof that experience had demonstrated it is economical.



GARDNER AIR WAGON



GARDNER AUTOMATIC UNIT

Made in Single and Two Stage Types

SAFE POWERFUL CHEAP

"LAFAYETTE PORTABLE STEEL CRANE"

The war is over and we are ready again to fill orders promptly. Labor and materials are 100% higher than pre-war. Our advances are only 50%. It is steel. It will not break. Roller bearings. Low center of gravity and will not upset. Double locked. It is safe. It is a heavy, strong machine for heavy, rough work. It won't wear out in 100 years. For the thousands in use we have not furnished $100 worth of repairs in seven years. It will always invoice at cost. It is in every state and most foreign countries. The only successful steel crane made and standard everywhere. It saves its cost in a short time. No first class garage or shop is without them and none other should be. For sale by jobbers everywhere. If the jobbing men who call upon you do not have it listed, write direct to the manufacturers.

NEW YORK
AUTOMOBILE REPLACEMENT IGNITION COILS

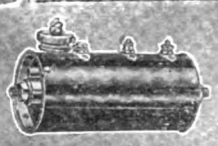
are the ORIGINAL Replacement Coils

that have successfully made Coil Replacements possible. Every sale is permanent, profitable and satisfactory. They are the most treasured line of the smallest and largest Service Stations throughout the U. S.

A special New York Coil engineered to suit the exact requirements of each car manufactured that will fire the poorest gas that positively will not "miss" at highest engine speeds and rival magneto ignition, is available.

They are installed with no trouble in ten minutes, as they positively fit each car. Fifteen years of successful coil building experienced by an organization of Ignition Specialists, is the reason a car owner always agrees when told he needs a New York Coil.

MORE REAL PROFIT, LESS COME BACKS AND EASIER MADE SALES THAN ANY ARTICLE YOU EVER HANDLED.

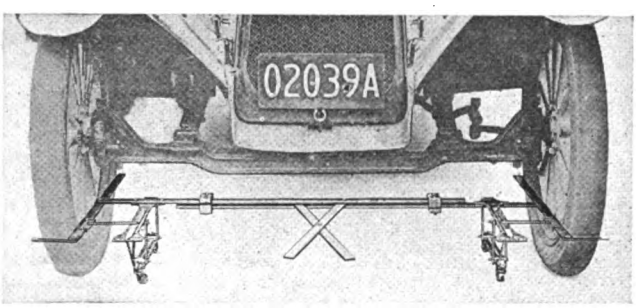


NEW YORK COIL COMPANY

338-340 Pearl Street New York, N.Y.

Duby's Wheel Gage

A positive instrument which tells instantly if wheels are out of line. Can be used on either front or rear wheels and adjusts itself instantly to any car regardless of the size of wheels or tires. The Pointers register on the dials in plain view of the operator.



With this device ten cars can be tested by one man in less time than two men could test one car by the old method. Price to garages and service stations $15.00. Special discount to jobbers.

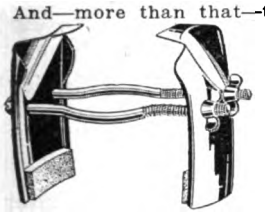
Steers Your Ford Safely

And—more than that—the Jubilee Stabilizer absorbs those numerous jerks, twists and jolts which otherwise tire the driver. Makes steering easy, safe and pleasant—'cause the wheel can't pull on the driver's arms or wrench from his hands. The Jubilee prevents this. It's a neat, clever and practical attachment. Costs



Only $1.50

ABSOLUTELY NO TOOLS REQUIRED FOR INSTALLATION

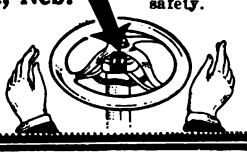
Good Profits for Dealers

Here's something that SELLS, stays sold, and sells others; turns your money quickly, with a good profit too—

The Jubilee Stabilizer

A safety-insuring and comfort-making steering device for Fords. Takes the place of high-priced and complicated accessories. Strong, durable, efficient, easily installed—just what the Ford owners need and want—yet it sells for **only $1.50.** Send *today* for our dealer proposition.

By acting as a safe and constant brake on the steering post, the Stabilizer keeps the front wheels steady—holds the car to the road—despite all bumps, ruts and high crowned centers. You avoid "turning turtle" or crashing into curb, and—with a Jubilee Stabilizer—there's no need of GRIPPING the wheel. You can pull out of ruts, round the curves, meet and pass others with perfect safety.



JUBILEE MFG. CO.

1328 Station C, Omaha, Neb.

Makers, also, of Jubilee Spark Plugs, Two-in-One Spark Plug, Bulldog Chain Fastener and Jubilee Spark Intensifier. Write for catalog.

JEFFERSON AUTOMOBILE IGNITION COILS

Small Stock For Fitting All Cars

Because of flexible caps, terminals and brackets these coils are adapted to all ignition systems. You are required to carry only a very small stock. Consequently, your investment is unusually small and at the same time you can fit all makes of cars.

JEFFERSON

Coils are famous for their long life, dependability and uniformly high standard. Order your stock at once.

Send for Coil List

showing list of all cars that are Coil-Equipped and the types of Jefferson Coils and Brackets to be used as Replacements.

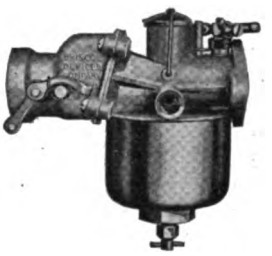
SCOE

CARBURETOR

MAKES A FORD RUN LIKE A SIX



SAVES ITS COST IN 60 DAYS

Any dealer who puts a Scoe Carburetor on one Ford, opens for himself a neat and profitable line of business.

Simply because this carburetor enables the Ford engine to perform as nothing else can or will.

Write us to send you the Scoe on our 30 Day Trial Plan. Pay half the net—$4.25—on receipt of the carburetor. Put it on a customer's machine and check up its performance for 30 days.

Then pay the balance, or ask a refund, and we will make it without a question.

That surely is a fair offer, and hundreds of dealers have proved it so.

August 11, 1919.

The Stenman Electric Valve Grinder Co., Inc.,
42 Southbridge St.,
Worcester, Mass.

Gentlemen:-

Replying to your letter of August 9th, would say it affords us much pleasure to send you our check to cover the cost of the Electric Valve Grinder sent to us for trial a short time ago.

We have no hesitation in stating that we have tried three or four other different makes of grinders, and consider yours much superior to any of them. Its smooth, velvety action enables us to make a much nicer job than any other valve grinder we have tried.

HHH/FM Yours very truly,

HALL MOTOR COMPANY,
By Harry A. Hall

The moral from the above letter, is that you insist on getting a "Stenman" and accept no other. "As good or better" has not yet been made. Your jobber can supply you—if not—write to —us. Circulars on request.

Made under U. S. Patents 876,449 1,313,490. Others pending.

"Will Pay 300%"

The Stenman Electric Valve Grinder will pay 300% yearly on the original cost where it is used to grind but one set of valves a week. If used more the returns will be proportionately greater.

"They Serve Best Who Are Best Equipped To Give Service"

The Stenman Electric Valve Grinder is the greatest time and labor saving tool that ever went into a repair shop. It is eight times quicker than hand work and does a better job. Thousands are already in use and you can depend on this wide use as a guarantee of its worth. Order one today from your jobber. It will have practically paid for itself before the bill is due.

"They profit most who serve best"

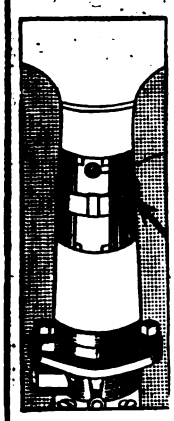
Starts Any Cold Motor In a Jiffy



Attaches to the Intake Manifold or Carburetor
Current from battery to a resistance coil in the heater warms the air inside the intake, causing the gasoline to **vaporize** and **ignite** with the **first turn-over** of the motor. Same heating principle as used in the electric flat iron. Gives same result as pouring hot water on the manifold.

This Electric Intake Heater

assures easy and quick starting on the coldest winter day, **and saves drain on battery.** No priming. No delays. Operates from dash switch. Easy to attach. **No drilling or tapping or alterations.** Entirely out of the way. Always ready and perfect in performance. Sold with the distinct understanding that it will give satisfaction when the simple instructions for applying are followed

If your car or truck has storage battery, write for descriptive matter today. **$3.50**

A FORD THAT PURR-R-R-S

That is the way your Ford will sound when you equip it with a

GARDNER THERMOSTAT CARBURETOR

The temperature of a Ford motor changes quicker and more often than the temperature of any motor. The Gardner Carburetor is designed to overcome this condition.

The Gardner THERMOSTAT CONTROL is governed by the temperature of the motor and automatically supplies the correct mixture for every varying temperature.

The GARDNER actually saves 25 to 50% of your gasoline, but the main advantage is a smooth purring motor whether cold or hot. Ask us for literature and open territory.

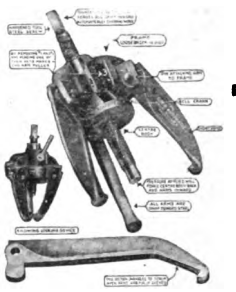
Gardner Carburetor & Brass Wks.

23 Hancock West, Detroit. Mich.

GREB AUTOMATIC GRIP PULLER

BEACH PATENT

"The One Best Bet" in Wheel, Gear and Bearing Pullers. Combinations of two or three jaws. Quick, Strong, Durable, Efficient and Simple. Positive Grip, cannot unhook and adjust to work instantly.



East of Rockies

Greb Arbor Press Base—designed to be used with the three long jaws of No. 1 Puller. Comes complete with two V Blocks and one T on. Makes desirable equipment for pressing off gears, bushings, bending pipes, straightening shafts, etc. It is a good Bench Plate. Width 11 in. Depth 2 in. Diameter of Center Opening 1 1/4 in. Weight approx. 90 lbs. Price complete $12.50

Greb Automatic Grip Puller

No. 1 Senior Size—designed for heavy work—a one man Puller with a locking device. Capacity 1 to 18 in. Complete with two sets of jaws, 7 in. jaws open to 10 in., and 12 in. jaws to 18 in. Screw of hardened steel, 1 in. diameter, 14 in. long. (See Arbor Press Base Attachment.) Shipping weight 30 lbs.
Price complete $25.00

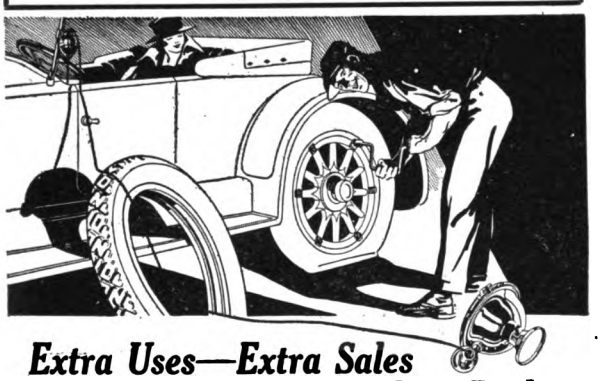
Greb Bearing and Race Attachment for No. 1 Puller has a Knife edge and can be forced behind magneto, electrical generator and self starter bearings and races where it is impossible for the jaws of any Puller to be attached. This attachment when used back of small gears and bearings not only saves them but the rest of the Puller jaws as well. Capacity—Bearings and Races up to 4 in. including 2 in.
Price complete $5.00

No. 2 Junior Size—designed for all types of motors. Will remove magneto and pump shaft gears, couplings, etc. An efficient tool for all small work. Capacity 1 to 7 in. Complete with two sets of jaws 2¾ in. jaws open to 4 in. and 4 in. jaws to 7 in. Screw of hardened steel, 9/16 in. diameter, 7¼ in. long. (See Bearing and Race Attachment.) Shipping weight 4 lbs.
Price complete $12.00

Greb Gear Attachment for all sizes of Greb Pullers has a 1/8 in. edge and can be forced behind gears where there is little or no room. This attachment when used back of small gears furnishes something for the jaws to get hold of and as it lays flat against the back of the gear it permits an even pull. Made in two sizes. Small size has capacity to take gears up to 3 in. on its front and 1¾ in. on its back.
Price complete $5.00

No. 3 Intermediate Size—designed to pull the average motor gears, such as timing, pinion, transmission differential, and crank shaft gears, carbon and universal joints, pulleys and for general work. Capacity 1 to 12 in. Complete with two sets of jaws, 5 in. jaws open to 8 in., and 9¾ in. jaws to 11 in. Screw of hardened steel, 7/8 in. diameter, 10 in. long. (See Gear Attachments.) Shipping weight 12 lbs.
Price complete $18.00

Large size has capacity to take gears up to 4 in. on its front and 4 in. on its back.
Price complete $8.00



Extra Uses—Extra Sales

The Handy Spotlight On a Reel

Autoreelite is a convenient and powerful spotlight with the added advantage of a self-winding cord on a reel. By two twists of the thumb and finger, Autoreelite can be reeled out to a distance of twelve feet.

There is a ready market for this combination spotlight and trouble-light. Motorists appreciate its usefulness for making repairs on the road at night. And Autoreelite is priced no higher than ordinary spotlights.

Security Auto Lock

Affords every protection to Ford car owners that a perfectly designed and extremely well made lock can give. While neat and attractive it is built very strong. In operation it is positive and the car can be left with a feeling of confidence that no one but the owner can use it.

It is the original loose wheel lock for Fords.

It is approved by underwriters.

It will reduce insurance premiums 15%.

When locked the car cannot be towed.

List Price, $6.00

It makes the Ford thief-proof

Anyone can easily install the Security in ten minutes. No drilling, filing, sawing or chiseling necessary. It is made of solid brass. Nickel plated finish.

TO DISTRIBUTORS

When this lock is shown no other will satisfy Ford car owners. It sells at sight. Our trade discounts are liberal and our proposition will interest any one that can sell high grade car protection at a moderate price. *Write for details today.*

THE JOYS OF A MOTORIST

What is a pleased customer worth?

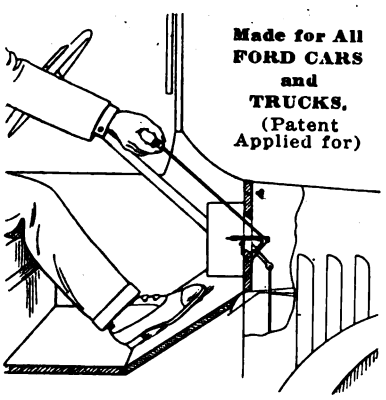
It's a rare motorist that doesn't cheer for Pep Plugs. Either he hasn't called on the right dealer or he is located beyond the Alps.

The Pep is self-cleaning. A sparking surface completely around the disk makes a ring of fire that cannot be had with other plugs. No broken porcelains. Motor starts easily in cold weather.

Your profits are good, your turnover fast. You want to begin making these profits early, and we want you to.

Every Pep Plug is guaranteed: **"Your Money Back If You'll Take It."** No strings to this guarantee.

PEP SPARK PLUG COMPANY,
233 South 6th Street, Minneapolis, Minn.



Made for All FORD CARS and TRUCKS. (Patent Applied for)

IN FIVE MINUTES YOU CAN INSTALL A

T-R STARTING AID FOR FORDS

It holds carburetor choke valve in any position.
Operates from seat. Trips with the foot.

All Other Cars Have its Equivalent, Why Not Your Ford?

ELIMINATES { Racing engine to warm it up
Continuous reaching for choke
Driving with too rich a mixture.

MAKES STARTING EASY, YOU DRIVE RIGHT OFF WARM OR COLD WEATHER ALIKE. SAVES GASOLINE BY A THIN RUNNING MIXTURE.

Equipment For Ford Cars

The ten items shown below are taken from our new catalog, which is now ready for you. As a dealer you are interested in satisfying your customers besides making money and if you sell Apco products you do both. Five hundred jobbers stock Apco goods and if yours does not, send your order to us and we will see that it is shipped promptly by a jobber near to you. Remember Apco means made right and advertised so that they sell themselves.

Get your catalog today and tell us your jobbers name.

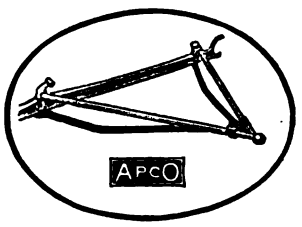
APCO MFG. COMPANY, Providence, R. I.

MUFFLER AND TESTING VALVE NO. 99

A one-piece cast Muffler with testing Valve cast integral. When open the Valve gives a clear opening for the gases and the valve positively will not stick or leak. Detects a missing cylinder instantly and its construction eliminates back pressure.

List $5.00
Dealer's Price.....$3.65
Lots of 5.....$3.39

FRONT AXLE BRACE NO. 117



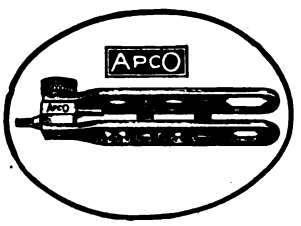
Designed to accomplish the same results as our No. 72, but it is not adjustable. Made from steel instead of angle iron. Finished in black enamel. A real article at a real price.

List $1.00
Dealer's Price..... 66c
Lots of 10..... 61c

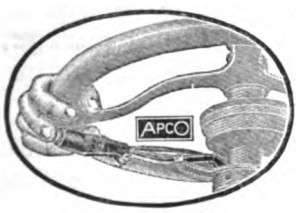
TIRE VALVE TOOL NO. 84

A six in one tool that should be in every kit. Dies are fitted with guides to prevent cross-threading. Tap is tapered to enter jammed valve. Wrenches fit valve stem nuts. One of the best tools ever offered to the trade. High grade steel hardened.

List $1.00
Dealers' Price..... 73c
Lots of 10..... 68c



HORN BUTTON NO. 9



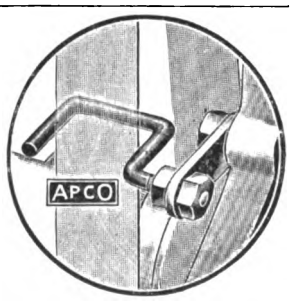
Places the Horn Button under the driver's finger all the time, where the horn can be sounded without an effort. Complete, ready to attach, and installed in five minutes. One of the best selling items we have ever offered.

List $1.00
Dealer's Price..... 73c
Lots of 10..... 68c

FAN BELT GUIDE NO. 36

Prevents the fan belt coming off, a fault found with a number of Ford cars. Adjustable and made from steel. Can be put on by removing one bolt as shown in cut.

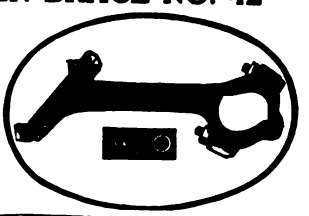
List 25c
Dealer's Price.....15c
Lots of 10..... 14c



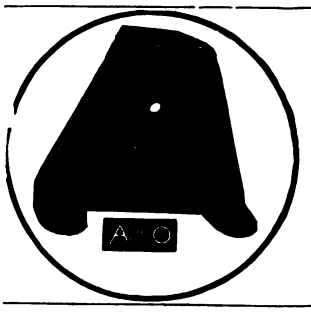
STEERING COLUMN BRACE NO. 42

Supports the steering column, preventing excessive vibration and loosening of the column caused by pulling on the steering wheel when getting in and out of the car. Consists of a black enameled malleable iron bracket, bolts and screws, ready to attach. Can be put on in a very few minutes.

List $1.00
Dealer's Price..... 66c
Lots of 10..... 61c



CRANK CASE ARM NO. 30



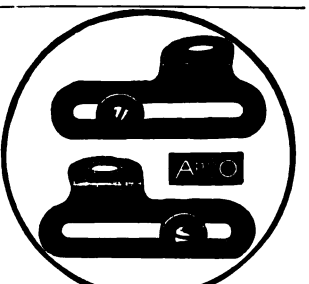
Replaces broken Ford Crank Case Arms in a few minutes, without taking motor down or welding of any kind. Remove four bolts and broken arm, place Apco Arm in position, replace bolts and job is done. Made from Loller plate steel, ¼-inch thick, finished in black enamel.

List $1.50
Dealer's Price..... 73c
Lots of 10..... 68c

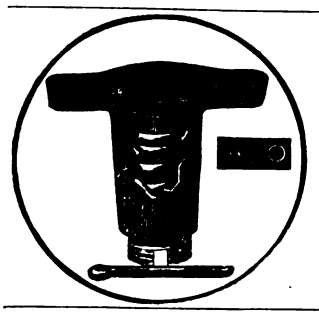
LICENSE BRACKETS NO. 27

Hold the front number plate or license tag rigid, under the spring clip nuts. Made from steel, finished in black enamel and furnished with nuts, bolts, washers, etc. Will fit any plate.

List 25c
Dealer's Price..... 15c
Lots of 10..... 14c



ANTI-RATTLERS NO. 21-51



Take all the rattles out of the Steering Rods and Radius Rod. Malleable iron castings, black enameled, heavy springs, pressed steel cups, machine cut screw plugs. Easily installed, and as necessary as gasoline.

Radius Rod Type
List (each).....50c

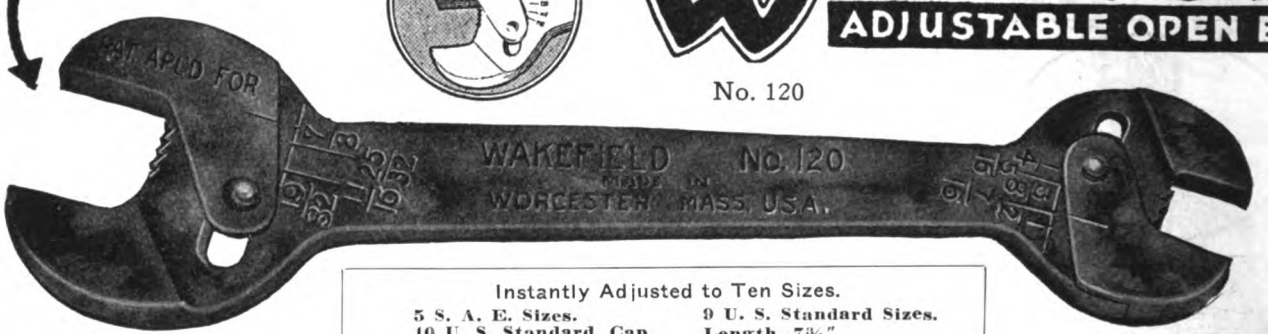
What More Can You Demand?

STRENGTH
UTILITY
DURABILITY
QUALITY
10 SIZES IN 1
ALL THIS AND MORE - YOU'LL FIND IN THE WIZARD

WAKEFIELD
WIZARD WRENCH
ADJUSTABLE OPEN END

No Knurl Adjustment.
No Back Lash.

No. 120



Instantly Adjusted to Ten Sizes.

5 S. A. E. Sizes.	9 U. S. Standard Sizes.
10 U. S. Standard, Cap Screw Sizes.	Length, 7¾".
4 Set Screw Sizes.	Thickness, ⅜".
	Width, 2⅛".

A combination tool equal to the average wrench set, a perfection of simplicity and instantly adjustable to ten sizes as follows: 1-4, 5-16, 3-8, 7-16, 1-2, 9-16, 19-32, 11-16, 25-32, 7-8.

It is made of highest quality steel, heat treated, by methods developed from 30 years' experience and manufacturing wrenches.

It is designed to economize time and labor, and compared with the cost of any other tools having equal utility, the price is extremely cheap.

There are ten individual settings, more quickly made than an exchange of tools, always in readiness for use.

No tool or even wrench set is its equal, in the shop, the service station or garage, or in the tool kit of the car, truck, motorcycle or bicycle.

It is guaranteed by the Wakefield trade mark, known the world over as a standard of quality.

The list price is $1.50 a wrench.

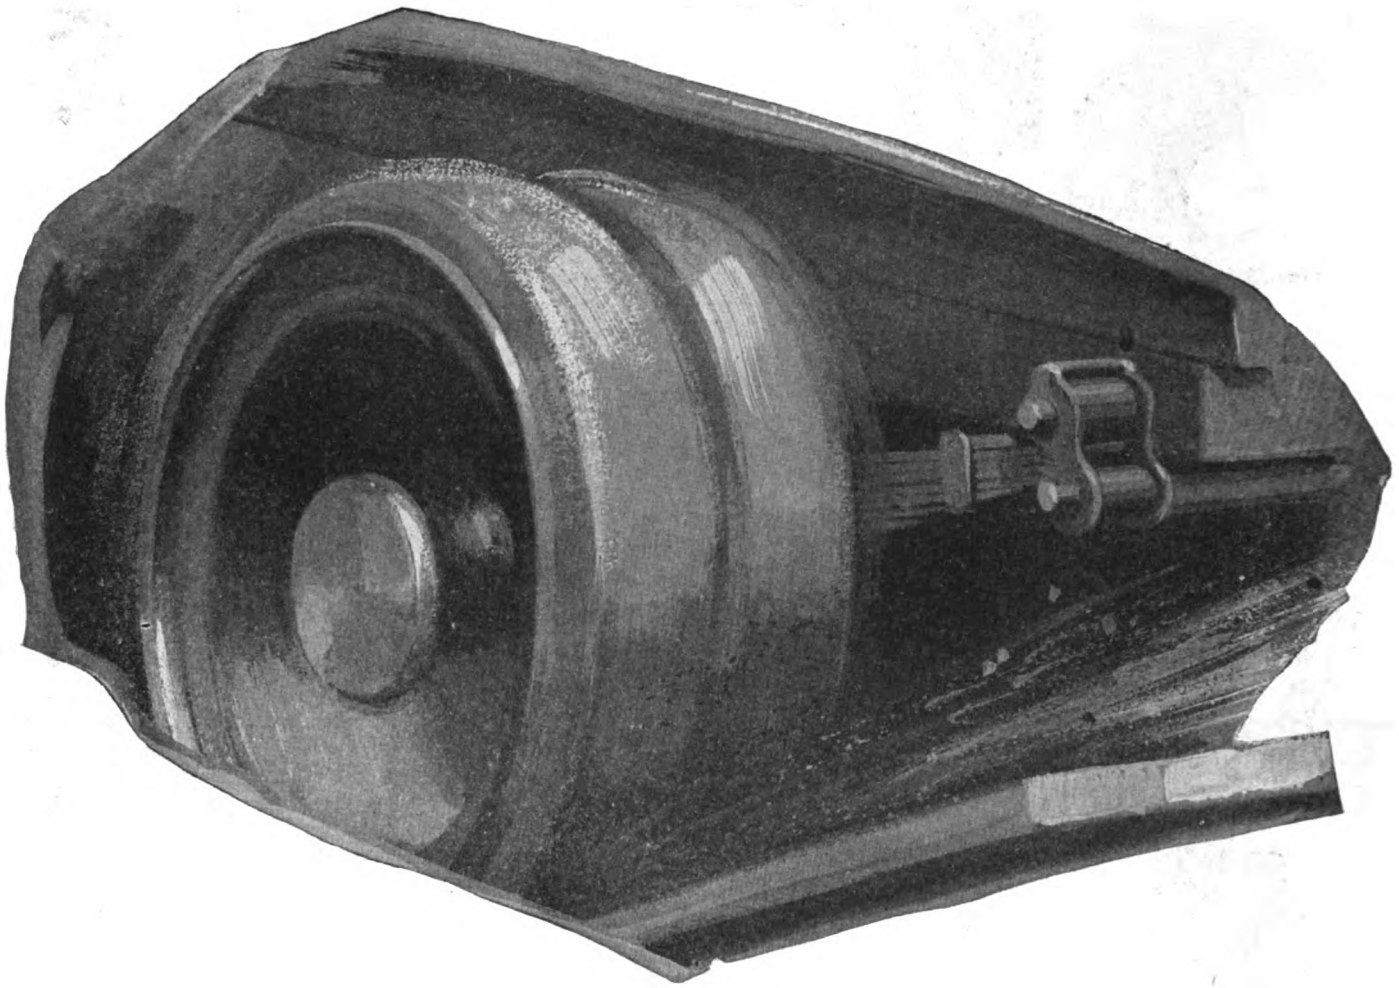
Powrlok in the Rear Axle



Stops Stalling

Powrlok actually does stop stalling and prevents skidding, because it automatically distributes the power to the rear wheels the logical way—in direct proportion to the traction or hold which the wheel has on the ground—instead of in indirect proportion as the ordinary differential does.

It supplies the power to the wheel that can use it instead of giving it to the wheel that wastes it in useless spinning.

Even conservative automobile engineers class it as one of the three or four greatest improvements made in motor cars within a decade. This is best proven by the fact that fifty manufacturers of all classes of automotive vehicles—passenger cars, trucks, tractors and industrial trucks—now use it as standard equipment.

Write for our new booklet entitled—"More Than a Differential."

Specify Powrlok when you buy.

THE POWRLOK COMPANY, 1107 East 152nd Street, CLEVELAND, OHIO

Foreign Representatives: The Powrlok Company, Ltd. Offices: 24 Maddox St. Regent St., London, England.
19 Avenue MacMahon, Paris, France.

Take Care of That Glare

And Make the Road Safe for Others as Well as Yourself

The Osgood Lens does a lot more than merely stop glare; it gives you a brighter, clearer light and more of it—out onto the road ahead of you *and downward*, right where you need it.

THE NEW

OSGOOD LENS

CRAVATH LONG DISTANCE TYPE

throws a powerful light one-third of a mile ahead of the machine and never more than waist high. It makes the road just as safe for others as it does for you and solves absolutely the safety-problem of night driving. Another thing, with the Osgood Lens, there is absolutely no need of dimmers.

DEALERS: There's more lens-profit in handling the Osgood, than in all the rest of them put together, and you get rid of having to carry all sizes of other lenses. Osgood outsells them all, because they do the business. Complete stocks of all sizes now ready for instant deliveries. Write us today.

Prices $2.90 to $4.50 According to Size.

Are you afraid to tell the truth?

When the car comes thumping into your garage, knocking like a wood pecker, are you afraid to tell the truth?

Don't you hate to tell the owner that his crankshaft needs regrinding?

You hesitate to tell him that you must take down the motor, remove the crankshaft, send it to a machine shop, and then after waiting a week, reassemble the job and present him with a bill that looks like the Allies' war debt.

It look as though you were trying to "put something over".

But if you will invest ten dollars in an Atlas Abrasive Tool, you can look your customer squarely in the eye and tell him the truth.

You can grind his crankshaft in ONE HOUR, and save him time, money and temper.

The Atlas Abrasive Tool, Patented Nov. 11, 1919, is built for all passenger car and truck crankshafts. Adjustable to pins up to 2½ inches diameter.

There is only one adjustment necessary with the Atlas and anyone with a sense of feel can do a job that is accurate within a thousandth of an inch—and finish the job in one hour. No lathe or other equipment necessary, the crankshaft need not even be removed from the crank case.

This tool is sure to make good for you, just like it has for hundreds of others. Master mechanics write us that they would rather part with a $50 bill than their Atlas Tool.

Price, complete with cutter, $10, postpaid. Extra cutters (including bronze bearing tracks) good for from 10 to 20 pins or bearings, 30c each.

ATLAS SPECIAL TOOL, Capacity 2 to 4 inches—$25.00 delivered.

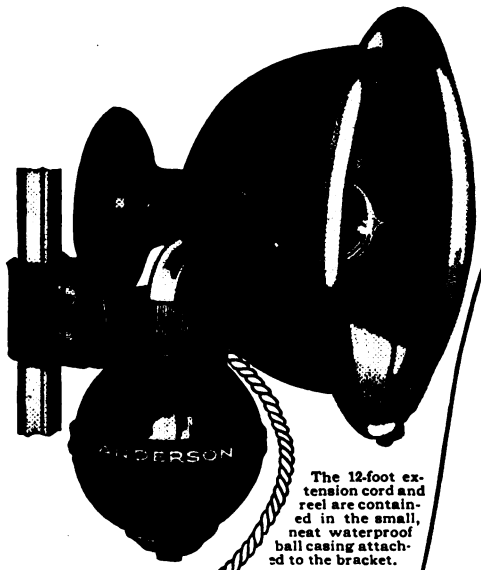
Autoreelite



The 12-foot extension cord and reel are contained in the small, neat waterproof ball casing attached to the bracket.

This feature is found only in the Autoreelite

WHEN Sinclair Lewis was touring to obtain the material on which he founded his interesting Saturday Evening Post stories "Adventures in Autobumming" the Autoreelite was part of his essential equipment.

It makes driving at night safe and sure. Has every spotlight advantage. Its powerful rays help "spot" and remedy motor and tire troubles.

Self-contained. No loose parts. Fits any windshield. Reels and unreels exactly like a window shade. Always ready to use. Made of highest grade materials and best workmanship. Costs no more than ordinary spotlights.

BURD Quick-Seating PISTON RINGS Are Easy to Install

No medium priced—One Piece—patented piston ring—ever offered to the trade—has won the approval of mechanics and motorists so quickly. Millions of BURD Quick Seating Piston Rings are in successful operation, in practically every type of internal combustion engine. They are unequaled for ease of installation, micrometric accuracy, quick and perfect seating, efficiency of operation and economy of fuel and oil for this type of piston ring.

Seats in 45 Minutes

The outer edges—the Quick Seating feature wear down quickly, producing a seat in harmony with the hard, glass-like surface of the cylinder, giving maximum efficiency (for this type of ring) almost immediately.

The central channel on the face of the ring, two thousandths of an inch in depth, carries an oil film which absolutely prevents undue cylinder wear.

No slow, laborious "lapping in" is necessary. There is no delay of several days before the owner can use his motor. The BURD Quick Seating Ring promptly adjusts itself to a new or worn cylinder, and perfect seating is obtained in about 45 minutes running. It saves time, expense and trouble during installation—is efficient in operation, and prevents delays, loss of compression, waste of power, gasoline and lubricating oil.

Sizes: Made in all sizes and oversizes for practically every make and model of internal combustion engine.

Prices: Sizes up to and including 4 inches, 60 cents each. Sizes over 4 in. up to and including 5 in., 70 cents each.

It has the Quick Seating feature of a narrow ring—the wall tension of a wide ring.

Most Popular One Piece Ring

BURD Rings are cast individually, from a tough, dense gray iron of special analysis, filtered so that all impurities are removed, to insure absolute uniformity of metal texture, maximum strength and resiliency, prompt and perfect seating, and freedom from flaws, porous spots and other defects. BURD rings are ground (not turned) to a micrometic accuracy of .00025 of an inch. They fit accurately—are exceptionally resilient—exert an unvaried wall pressure, and will not break down under cylinder heat conditions.

Order From Your Jobber—Write for Directory of Sizes

Ask your Jobber's salesmen—or write now for the new 1920 BURD Piston Ring Directory of Sizes, and Dealer's Price List, which give complete information.

This view shows both the Whistler and the Lox-on in action.

LOX-ON TRADE MARK AIR CHUCK "DOESN'T RUB THE RUBBER"

Grips the Valve

Guards the tire against incorrect inflation. Set it for any pressure desired. It whistles when the right amount of air enters the tire. You can't put any more in. Saves 50% to 75% on tires; 20% gasoline; 100% time, trouble and temper.

YOU know the usual type of air hose chuck—you have to *push* it down on the valve. In a short time the rubber washer wears out—the chuck leaks and you've got to fix it—and then it does it again!

The Lox-on Air Chuck is positively *guaranteed* not to leak or wear out quickly. The rubber is not chewed to pieces by the valve threads. It slips over the stem freely—then, by turning the lever, you make it grip the valve like a hand.

When ready to take off, reverse lever.

Simple, strong, everlasting and efficient, the Lox-on Air Chuck answers the crying need of garage men everywhere for a chuck that can be used indefinitely without wearing or leaking. $3.00 each.

PROOF of a Better Cooling Service

THERE is no stronger proof of efficient service than past performance under actual working conditions.

Modine SPIREX Radiators have been giving dependable service in hundreds of Ford cars and trucks. The following is one of many instances of SPIREX superiority:

CITY OF MILWAUKEE
DEPARTMENT OF PUBLIC WORKS

On September 5th, I asked you to make up a Ford radiator with a SPIREX core for my Ford, as it was almost impossible to drive even five miles with the original radiator without opening my side door and even taking off the hood in order to let the excess heat from my motor escape. My motor would pound terrifically and during one trip of 196 miles, it was necessary to refill with water three times.

Since using this SPIREX core radiator this excess heat has disappeared, the knocks are eliminated, miles per gallon of gasoline have increased and after driving 533 miles one quart of water refilled my radiator.

In fact I am so well pleased with this radiator that I am today ordering four more to be used on our one-ton trucks.

They are the best ever brought to my attention.

Very truly yours,
H. W. PARKER, Supt., Municipal Garage.

GILL

The Perfect One Piece Piston Ring

This is a picture of "Mac." He is a corking good mechanic and a great booster for the Gill Piston Ring. "Mac" says you only have to show a motorist a Gill Ring to sell it and thousands of dealers all over the country have found this true to the advantage of their business.

What is the reason for this "Gill Enthusiasm"?

Look at the double step, interlocking joint and you will see for yourself. It allows an expansion of from $1/8$" to $3/16$" before any loss of compression occurs. In addition Gill Rings are made from single piece castings of special fine gray iron and machined to absolute accuracy. The easiest ring on the market to install, the easiest ring on the market to sell.

Send for the new Gill Piston Ring Size Directory, complete, convenient and full of just the information you need. It is free to the trade.

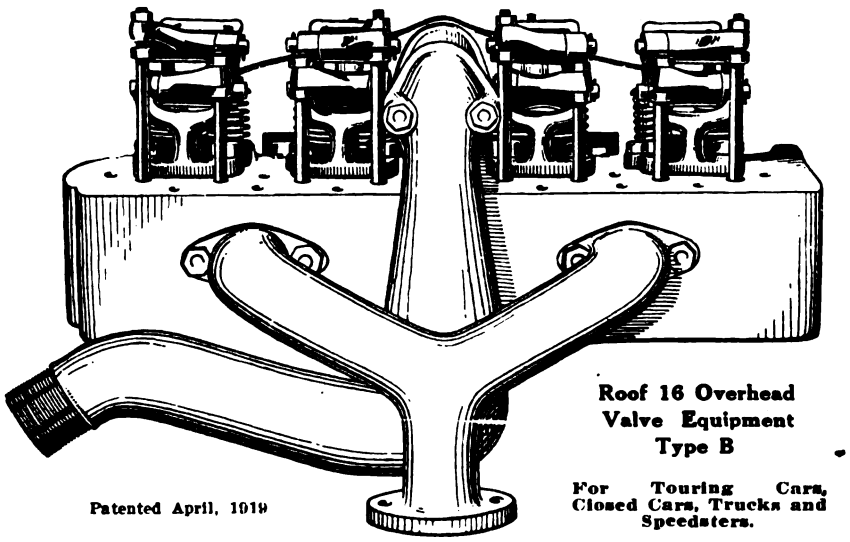
POWER and SPEED ROOF 16 OVERHEAD VALVE EQUIPMENT for FORD MOTORS



Patented April, 1919

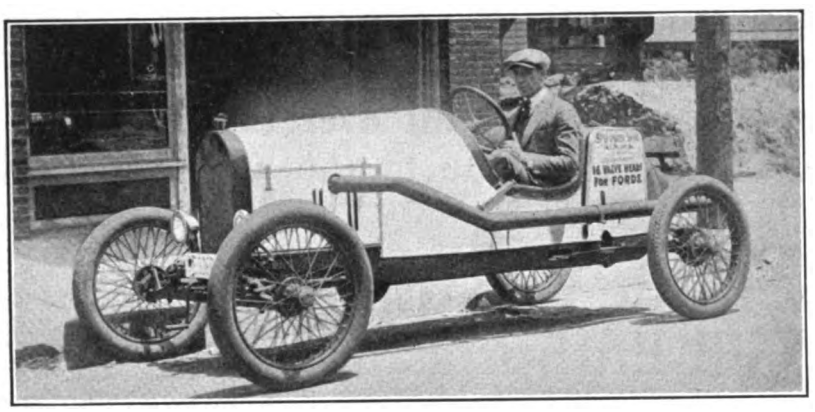
Roof 16 Overhead Valve Equipment Type B

For Touring Cars, Closed Cars, Trucks and Speedsters.

The Most Remarkable Power Device, Even in This Inventive Age

Hill climbing for touring cars—pulling power through sand and mud—doubles the hauling capacity of converted Ford truck-speed for mile and half-mile tracks to rival the fastest cars built. Ford racing cars with our Cylinder Head Equipment and special racing parts have attained speeds from 80 to 100 miles per hour. Hill climbing and pulling power for touring cars, closed cars and trucks. Price, complete, $115.00 f. o. b. factory. Nothing extra to buy. Cylinder head equipment all ready for installation. It takes the place of the regular Ford Cylinder Head. Any mechanic can easily and quickly install it.

Comparison Brake Horse Power Tests at the United States Bureau of Standards gave Standard Ford motor with regulation carburetor 18.7 Horse Power. The same motor with 16 Valve Head and regulation carburetor 22.4 Horse Power. The same motor with 16 Valve Head and Special carburetor 29.7 Horse Power. Recent tests at Bureau of Standards with Type B gave 32 Horse Power. We are Manufacturers and Distributors of speed and other specialties for Ford cars; 3 to 1 gears, high speed camshafts, aluminite, light grey iron pistons, lynite pistons, aluminite connecting rods, racing spark plugs, racing carburetors, roller bearings, counterbalances, wire wheels, multiple speed transmission, high tension magnetos, special oiling system, special worm and gear, steering gear, racing tires, racing bodies, hood and radiator, parts for underslinging chassis. Tell us what you want. We can supply it. Racing quality. Lowest prices. Send for our Complete Literature on how to build fast cars and double the value of your converted Ford Truck and descriptive circular on Speed and other Specialties for Fords.



16 Valve equipped fast speedster of high class design and construction owned by The Speedster Shop, Los Angeles, Calif. Speed, 70 miles per hour.

Ford Racing Car Speed Kings

From the hundreds of fast Ford car drivers we mention the names of a few of those who have won laurels through the use of our equipment and some with speed records approaching that of the highest priced racing cars in the world, ranging from 70 to 97 miles per hour, and who on mile and half-mile tracks have closely approached the world's record with their speed cars:

The Motor Car Spring and a Sectional View of the Disteel Wheel

Facts You Should Know About the Wheels of Your Motor Car

A motor car wheel should be so designed and constructed that road shocks cannot be transmitted directly to the bearings and the delicate mechanism of the car.

In the illustration at the top of this page is shown a motor car spring. That spring is thicker, heavier at the center than it is at the ends.

The spring is tapered.

It is tapered because it is a spring. The taper distributes and diffuses the strains.

The spring is dished.

That means it is curved slightly, which also serves to distribute and diffuse the strains.

Another example—In precisely the same way as the muffler of your car breaks up, diffuses and nullifies the noises that come from the exhaust of the motor—the wheel of the motor car can and must break up, diffuse and nullify the road shocks before they reach the hub, the axle and the bearings of the car.

The spring is made of steel.

Disteel Wheels are made of steel.

That Disteel Wheels add immeasurably to the beauty and distinction of good motor cars is, of course, universally accepted. However, from the viewpoint of mechanical excellence and in conclusion of the foregoing statements, we ask you to remember that—

Disteel Wheels are Tapered, Dished and Made of Steel.

Wheel Talk Number One

Being the first of a series that will appear at regular intervals in this publication. In this series we propose to tell some simple, basic truths about motor car wheels for the information of motor car owners and for the development of more economical and more comfortable motoring. We propose to outline, not only the principles of the scientific designing, engineering and construction of motor car wheels, but, also, those essential features which the car owner can and should demand of his wheel-equipment. If by these wheel talks we assist in raising the standard of wheel construction, we shall feel that we have been abundantly repaid.

Paterson SIX

Out Of The Price Class

Yet it costs no more. That is the expression of the Paterson ideal and the Paterson policy.

The standards of the W. A. Paterson organization do not permit blind following of blind leaders—we create, without regard to price competition, and prospective car buyers probably think less of the dollar sign when viewing the Paterson Six than they do in considering any other car.

The Paterson Six is a finer value—obviously it is so much more desirable a purchase than others in its price class that buyers are agreeably surprised when they sign the dotted line to find that the price of the car is so modest.

The body is a masterpiece of the builder's art—the product of craftsmen. Long wheelbase permits full comfort. The flow of the smooth-blending lines creates pride of ownership. The color choice permits of artistic self-expression by the discriminating buyer. The standard, use-approved specifications completely satisfy the mechanically wise, and give point and justification to our claim that the Paterson Six represents a finer motor car value.

THE ATSCO PORTABLE AIR TANKS

For EMERGENCY ROADSIDE REPAIR JOBS

Service and Speed Count Big In Profits

In every emergency job there is always more or less work to do on tires.
A stalled motor makes the power pump useless and the inflation of tires with a hand pump is slow and tedious work, costly and not practical.
With an Atsco Portable Air Tank in the emergency car, any tire can be inflated in less time than it takes to find and attach a hand pump.
The Atsco adds to the repairer's profits in time and labor saved. It supplies all the air wanted, when and where needed. It eliminates all effort and adds to efficiency.
The Atsco has almost unlimited utility in the shop, garage or service station. It is service equipment that permits quick and satisfactory work. It is light in weight, compact and easily carried. Where air can be used the Atsco will supply it.
Atsco Tanks are 36 inchs in length and 10 inches diameter. They are made of steel with genuine copper brazed seams and joints, good for 500 pounds and intended for a working pressure of 250 pounds. All Atsco Tanks are guaranteed to be absolutely air tight.

Atsco Tanks Are Shipped Completely Equipped With Hose and Tire Valve and Connection For Filling. Nothing More is Needed or Necessary.

LIST PRICE $24.50 f. o. b. Pittsburgh, Pa.

Many service stations have in use a dozen or more Atsco Tanks. All repairers should have one. In emergency service there is no equipment more desirable.

We specialize in the production of garage pressure tanks, and have in stock or will build to specification tanks of any size or pressure requirements.

Our tanks are used by most of the producers of compressor and air storage systems.

These tanks are genuine copper brazed construction and the seams and joints are far stronger than the stock metal. They will not crystalize or crack and are guaranteed air tight.

We make pumps and pressure tanks for all purposes.

PEERLESS RADIATORS

PRACTICALLY FREEZE AND BOIL-PROOF

PEERLESS Guaranteed Radiators are equipped with the indestructible Peerless Honeycomb Core, that is so efficient for the cooling of Ford engines.

ALL parts coming in contact with water are of brass. Dimensions same as regular Ford radiator, insuring quick and easy installation on the reliable Ford car.

BECAUSE of the superiority, usefulness and attractiveness of the Peerless Radiator, a tremendous demand has been created. Thousands of satisfied users attest to the efficiency of the Peerless.

IT IS estimated that approximately $2,000,000 is spent monthly in the replacement of Ford radiators. Are you getting your share of this tremendous business that awaits Peerless Dealers?

ASK your jobber about Peerless Products for Ford Cars:—Radiators, Radiator and Hood Combinations, Fenders, Tool Boxes—or write for complete catalogue.

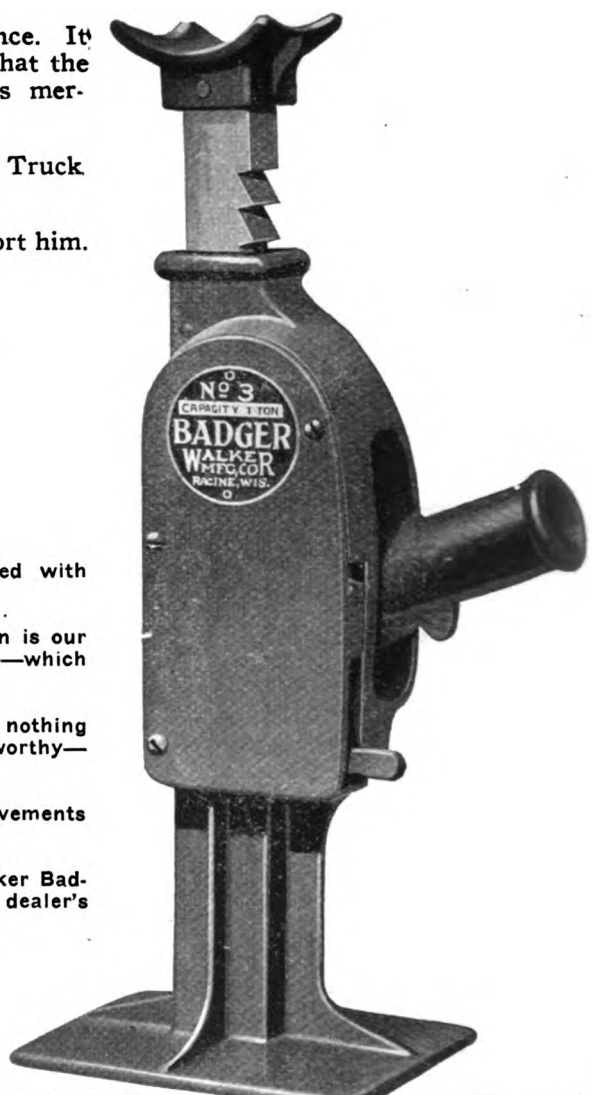
"If It Doesn't Satisfy You—Bring It Back"

That's the kind of talk it takes to sell goods. It creates confidence. It establishes a plane of buying protection. Any motorist knows that the dealer who makes such a statement is sure of the quality of his merchandise.

Dealers who handle the Walker Badger line of automobile and Truck Jacks—are sure. There is no question as to quality.

We, the manufacturers, stand solidly back of the dealer. We support him. Make selling easy. And satisfaction certain.



WALKER BADGER AUTOMOBILE JACKS

Are critically factory tested for lifting strength and endurance. Labeled with lifting capacity.

Each is packed in a neat, attractive cardboard carton—and on the carton is our printed guarantee of satisfactory service—signed by us. A positive pledge—which will never be violated.

Our confidence in our own product begets buyers confidence. It proves as nothing else can that Walker Badger Jacks are designed and built to give trustworthy—dependable service. And they do.

Walker Badger Jacks possess many exclusive and vitally important improvements—many selling advantages which promote profitable, desirable trade.

DEALERS, send for Catalogue illustrating and describing the entire Walker Badger Jack Line—"a Jack for every job." Get our dealer's proposition and dealer's sales-making helps.

Sterling Spark Plugs

Why a Tractor Plug For a Motor Car?

Sterling Tractor Spark Plugs have been developed to meet the most exacting requirements of tractor motors.

Ordinary spark plugs will not withstand, for any length of time, the high heat produced by these internal combustion engines.

Sterling Tractor plugs meet the severest tests imposed, for they are scientifically constructed. The porcelain core is unusually heavy; the combustion chamber extra deep, and the center electrode—made of monel metal—will not warp.

Since Sterling Tractor plugs fulfill the demands of tractor engines they are, naturally, the best possible spark plug for use in the motor car. These heavy-duty plugs are like all Sterlings, they are separable and easily cleaned.

Progressive garages and supply dealers everywhere sell and endorse these Sterling guaranteed plugs.

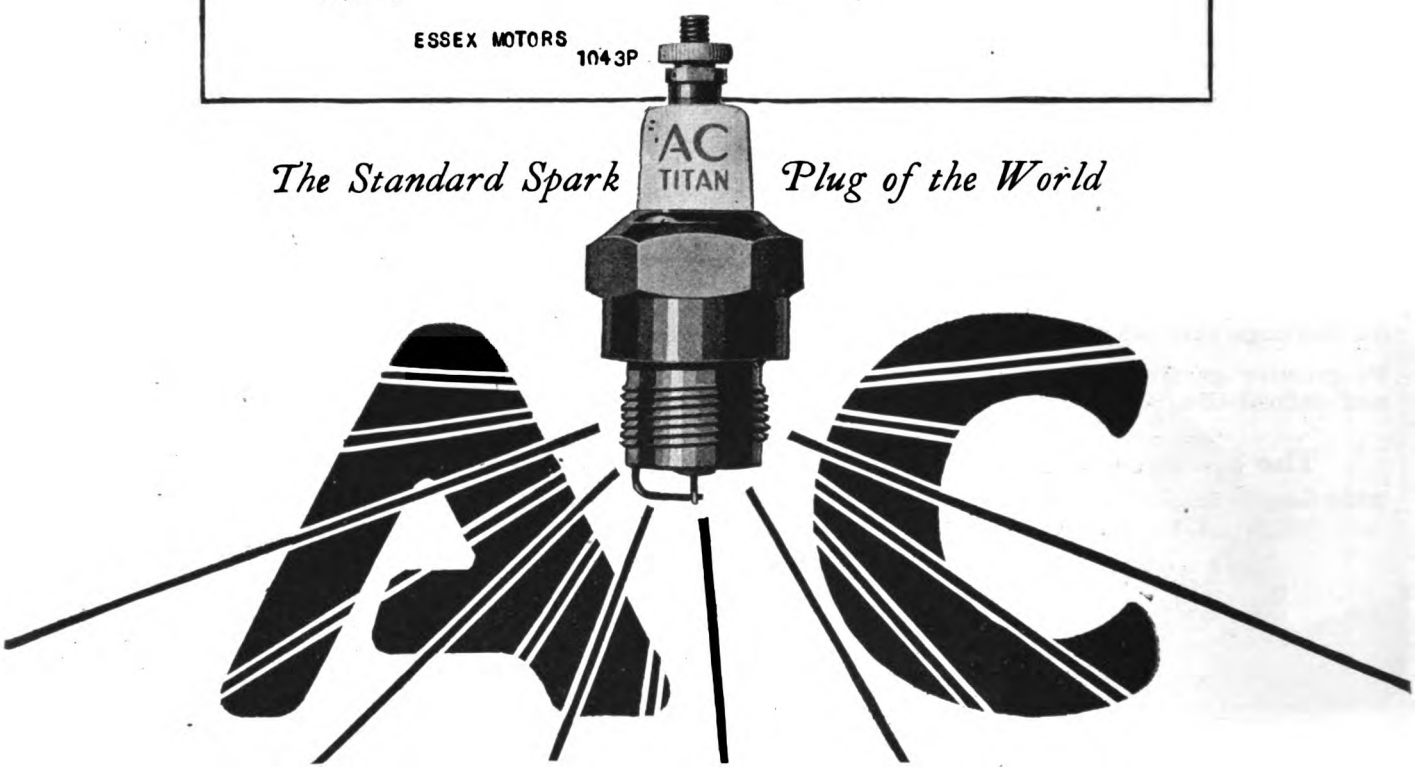
CONGRATULATE YOU ON EXCELLENT PERFORMANCE OF THE AC PLUGS USED IN ESSEX CAR WHICH RECENTLY COVERED TOTAL OF FIVE THOUSAND EIGHT HUNDRED SEVENTY MILES AT AN AVERAGE OF BETTER THAN A MILE A MINUTE

ESSEX MOTORS 1043P

The Standard Spark Plug of the World



When the Essex established the new world's endurance record for stock chassis of 3,037 miles in 50 hours of continuous running on the Cincinnati speedway, AC Spark Plugs shared in the achievement.

The six plugs that sparked the Essex engine not only functioned perfectly in the successful 50-hour test, but also fired the motor charge for 94 hours and 22 minutes, during which time the record-smashing car covered a total of 5,870 miles at better than mile-a-minute speed.

The dealer who sells AC Spark Plugs, like the car maker who specifies them and the car owner who uses them, has the best spark plugs that the foremost ignition engineers can design. It pays that dealer, both in dollars and cents, and in customer good will, to stock AC's. Write today for dealer information.

A Guaranteed Radiator for Fords

Ford owners, who generally know what Radiator trouble means, will appreciate a Radiator made good enough so that it can be guaranteed.

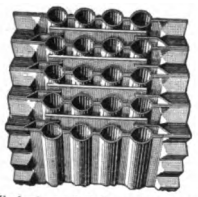
Every Lober Non-Bursting Radiator bears the manufacturers guarantee tag. It is put there for your protection and means just what it says. In the past two years thousands of Ford owners have taken advantage of this liberal guarantee of good quality, and have equipped their machines to their lasting satisfaction.

The patented construction of the Lober Radiator gives elasticity, strength and absolute freedom from freezing trouble. Super-cooling in hot weather and made to stand up under the shocks and strains of rough driving.

Lober Non-Bursting Radiator

Patented Nov. 12 and 18, 1918

Close up view of the front of a Lober Non-Bursting Radiator.



End view of Lober patent core showing flat brass spring between each water tube section. This core will stand repeated freezing without damage.

Showing how water tube expands under pressure, such as freezing. Flat spring presses the tube back to size after each freezing.

This Radiator is not an experiment. Many thousand are in use on Ford cars and giving splendid satisfaction. There is a reason. The patented Core construction allows the water tubes to expand and contract—without damage. This is obtained by a flat brass spring between each water tube section. It also makes the Core elastic so that road shocks are absorbed without leaking. Made of brass throughout. Strongest possible construction giving long service. Water tubes are straight and will not clog. Whirling of air through Core gives exceptional cooling no matter how hot the day or how hard the going. The perfect Radiator for all Ford cars or trucks.

Guaranteed Not to Burst From Freezing

Every Radiator bears the manufacturer's guarantee tag. That explains why it's easy for dealers to make sales. Write at once for photographs and detailed information. You will be interested in this new type Radiator that is doing such wonderful work on any and all Fords. Bitter cold nights, boiling hot sun or rough country roads have no terrors for the man who drives with a "Lober."

He Earns $50 a Week Repairing Autos

THOUSANDS of men everywhere are doing the same. Many are getting more than this. Some are opening garages of their own. Why don't you get into the auto game too? Men in other lines with a little mechanical ability have doubled their earnings after getting into the fascinating field of auto construction and repairing. Ten times the number of men now engaged in the business are needed. Fine, big paying jobs are waiting for men who "know" to fill them. Read below and find out how you can fit yourself to hold one of these big, man's size jobs in your spare time, without going away from home at a cost of only 7c a day.

Learn at Home

No need to pay for an expensive course that will take you away from home. You can learn the auto game at a cost of one-tenth the expense of going away to school. You don't have to serve an apprenticeship either. Use spare time only and keep right on with your present work. This Library of Automobile Engineering and Tractor Information will make an expert out of you and fit you for the biggest kind of job. It is in six thick volumes, with 2600 pages and 2300 pictures, plans, diagrams and blueprints, etc. Every part of every well known car is explained. They teach you everything the best auto schools teach.

Fifteen great auto engineers prepared these money-making books for men like you. You don't have to know a thing about cars to understand them. Every page is written in plain, everyday language and they begin right at the beginning. With every set we give FREE a consulting membership in our society. You can write our engineers any time and get their help on any proposition on which you get stuck.

Everything About Autos

Automobile Motors; Welding; Motor Construction and Repair; Carburetors and Settings; Valves, Cooling; Lubrication; Fly-Wheels; Clutch; Transmission; Final Drive; Steering; Frames; Tires; Vulcanizing; Ignition; Starting and Lighting Systems; Shop Kinks; Commercial Garage Design and Equipment; Electrics; Storage Batteries; Care and Repair of Motorcycles; Commercial Trucks; Gasoline Tractors.

128 Blueprints of Electric Wiring Diagrams

FREE Examination!

Mail the coupon for free examination. Don't send any money. We will ship the books (all 6 volumes) by express collect and you can have a whole week to use them as if they were your own. Give them every test you can think of. Take them to your shop. Show them to your friends and ship them back at our expense if you don't want to keep them. If you do keep the books to help you earn more, send us only $2.80. You can send the balance of the $21.80 price the same way—$2.00 each month. Only 7 cents a day. This is your chance to double your earnings—earn two dollars in the same time it takes to get one now. The coupon is your start. MAIL IT TODAY.

Don't Send Money— Just Mail This Coupon

American Technical Society :: Chicago

AMERICAN TECHNICAL SOCIETY
Dept. A782, CHICAGO, U. S. A.

Please send me the 6-volume set of Automobile Engineering for 7 days examination, shipping charges collect. If I decide to buy I will send $2.80 within 7 days and balance at the rate of $2.00 a month until $21.80 has been paid. Then you will send me a receipt showing that the set of books and the Consulting Membership are mine and fully paid for. If I want to get along without the books, I will notify you after 7 days to send for them at your expense.

A Picture of Business Health

You'll never need a doctor for your business if you have a Marvel No. 5 in your shop. It is always in shape—is spack and span—ready for work. It always does a high-class job and is the greatest little money maker you ever saw. It works faster and does better work at less cost than any machine ever invented and handles any gas engine cylinder from a MOTORCYCLE TO A TRACTOR.

Marvel Cylinder Re-Boring Machine No. 5

In your shop will double your man-power—will turn wasted time into profitable hours—will establish you in the Re-boring business and show a profit on your books.
The Marvel No. 5 is power-driven—automatic—accurate and speedy. It has been endorsed by hundreds of schools and colleges and automotive repairmen.

GET THE PROFIT

There's a lot of extra money floating around in your community and you can get it with a Marvel No. 5. Think of the hundreds of owners of motor cars, trucks and tractors whose cylinders need reboring. Cash in on it. Get in shape to rebore them on a Marvel No. 5 and fit them with Marco Oversize Pistons.

MARCO PISTON SERVICE

WRITE US TODAY

We will outline our entire proposition. We will tell you what a Marvel No. 5 will do for you—Will show you the profit you can expect. We will explain how, through our Co-operative Business Building Advertising, we help bring customers to your shop and how the Marvel No. 5 will hold them.

The ACCESSORY and GARAGE JOURNAL

VOL. IX. PAWTUCKET, R. I., FEBRUARY, 1920 No. 10

Success of Boston's Big Automobile Show Is Assured

Unbounded Enthusiasm Is Manifested in 20th Annual Exhibition, with a Record-breaking List of Exhibitors.

IN REGARD to the 20th annual Boston automobile show, which is always anticipated as the big closing event of the season's typical American car exhibitions, it is, perhaps, not too much to affirm that when the doors of Mechanics' building are thrown open Saturday, March 13, at 2 p. m., for its inauguration, there will be seen the most representative and comprehensive exposition of all phases of the automotive industry that has ever been brought together under one management and at one time.

According to latest information given out by the management, this 1920 Boston show will exceed the New York and Chicago expositions of this year in number of passenger car exhibitors by at least five, and these will include 12 new makes never before shown, and the number of commercial vehicle displays will equal, if it does not overrun, those at the two metropolitan shows. And in regard to accessories, when it is stated that this department will surpass by at least 100 the maximum number of displays ever before seen at Boston, the magnitude and completeness of this section can well be imagined. The management states that had the necessary space been available the list of exhibitors could easily have been augmented by at least a hundred concerns who have been for the past two months clamoring for a chance for representation.

It should also be remembered in gauging the magnitude of this exhibition that 40,000 additional feet of floor space have been added to the 105,000 afforded in the Mechanics' building, by overflowing into the South Armory on Irvington street, which is only a few minutes walk from the main show. Every available inch of exhibition space in the two buildings has been taken and will be filled, with the latest offerings of the season in passenger and commercial cars, with their accessories and equipment, not forgetting to mention the hundreds of spaces that will be devoted to up-to-date equipment in the way of tools, appliances, etc., for garages and repair shops.

Divisions of Departments.

The management has divided the exhibition this year as usual into various departments for better classification of displays and their accessibility to the visitor. Departments A and B on the main floor of Mechanics' building will be occupied exclusively by passenger cars. Departments C and D in the basement will include only commercial vehicles in the former, while in the latter passenger and commercial cars, sundries and machinery will be shown. Department E in the balcony section will house passenger cars and accessories and Departments F and G on this floor will be exclusively devoted to accessory exhibits.

Chester I. Campbell, General Manager Boston Automobile Show.

At the South Armory will be seen both passenger cars and commercial vehicles and their respective accessories.

One ticket will admit the visitor to both buildings, a coupon being provided which will allow admission to either place first at the option of the holder. The general admission price will be 50 cents.

The decorations this year will again be in charge of A. W. Campbell who has presented so many strikingly appropriate settings for this event in the past. While the details of the decorative scheme are not yet made public, it is assured that something entirely novel and pleasing will be presented in the way of a spring time motif.

The doors will be thrown open on Saturday, March 13, at 2 p. m., and will be open every day thereafter, with the exception of Sunday, from 10 a. m. until 10:30 p. m., until and including Saturday, March 20.

As in the past, the management will provide musical entertainment of a high order in the various departments during the show, and many little touches will be noted that will add to the convenience and comfort of exhibitors and visitors, such as the Bureau of Information, located in an office near the main entrance, and telephone service which includes a telephone in every exhibition space, the Back Bay telephone exchange supplying a force of 12 operatives to handle calls from the auto show.

Digitized by Google

This event is again held this year under the auspices of the Boston Automobile Dealers' Association, Inc., and the Boston Commercial Motor Vehicle Association, Inc., and the general manager is Chester I. Campbell, who has directed these exhibitions from their inception, and also serves as secretary of both of the organizations sponsoring the show.

An idea of the colossalness of the display may be gained from consideration of the fact that over 11,000 tickets are required for the exhibitors, agents and salesmen who participate in the show during the seven days it is in progress. The decorations alone will cost close to $50,000, while the rent of the two buildings for the time they are used during the period of preparation and the duration of the show would make a big salary even in these days. Manager Campbell will have a staff of over 200 men to manipulate the machinery of the show while it is on. Add to this advertising and other overhead expenses and it foots up to over $100,000.

As is ordinarily the case, show week in Boston will be signalized by many gatherings of a business and social nature by bodies allied with the automotive industries, such as annual meetings, conventions, conferences, banquets, etc., and there is no doubt there will be one of the biggest assemblages of representatives from the eastern section of the country as has seldom been seen at the Hub.

Nor are the activities of the week by any means confined to interests directly concerned in the auto show. It has come to be recognized as Boston's greatest business week, a veritable spring time awakening to the strenuous industrial and commercial life of a new season. Hotels are booked to capacity far in advance, and thousands who will be in Boston that week are forced to resort to lodging houses or rely on the hospitality of friends. Restaurants and theaters, department stores and retail merchants generally do a tremendous business. The visitors come prepared to spend liberally and millions are thus dropped into the coffers of the Boston merchant as a result of the Boston automobile show.

The officials of the organizations under the auspices of which the exhibition is held this year are as follows:

Boston Automobile Dealers' Association, Inc.—Directors: J. H. MacAlman, president; J. S. Hathaway, vice president; F. A. Hinchcliffe, treasurer; J. W. Bowman, C. E. Fay, J. H. Johnson, J. W. Maguire, C. P. Rockwell, F. E. Wing.

Boston Commercial Motor Vehicle Association, Inc.—Directors: J. S. Hathaway, president; J. W. Maguire, vice presdent; E. Day Baker, treasurer; P. S. Aultman, L. B. Sanders, J. L. McKone, N. H. Halliday, J. H. MacAlman, C. P. Rockwell.

The latest revised list of exhibitors, which is given out by the management as only partial, is added herewith.

Mechanics' Building, Huntington Avenue, Boston, Where the 20th Annual Automobile Show Is to Be Held, March 13-20.

Pennsylvania Rubber Co's Growth

COAST TIRE & RUBBER CO. INCORPORATED IN OAKLAND, CAL.

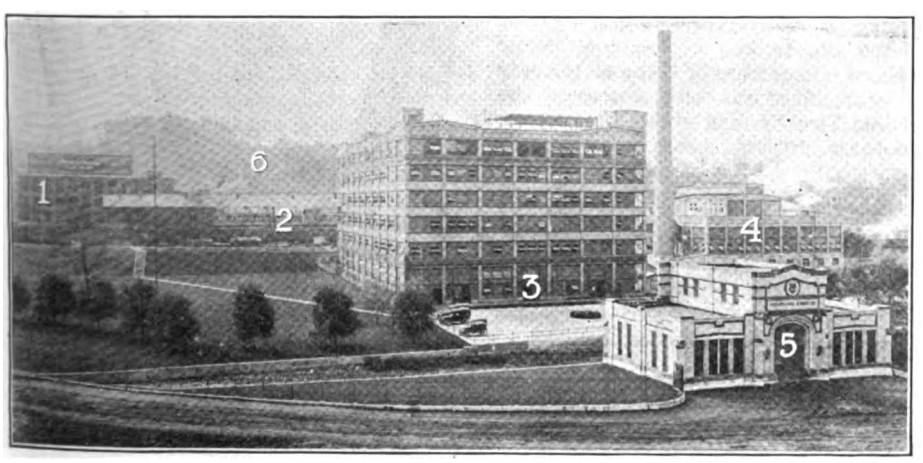
The accompanying illustration of the up-to-date plant of the Pennsylvania Rubber Co. at Jeannette, Pa., shows the extent of the company's activities at the present time. This concern has built up its organization, step by step, from the inside, and has been strengthened by each successive year of its progress by its policy of maintaining its standard of a quality product manufactured by well-paid, self-respecting employees, under a rigid system of inspection, and the adoption of an automatic selling plan guaranteeing protection and profit proportionate to the efforts expended by the dealer.

The growth of the business in 10 years can best be noted from a comparison of the following figures for 1910 with those of today:

1910—Number of employees, 460; daily production of automobile tires, 120; of tubes, 120.

1920—Number of employees, 2849; daily production of automobile tires, 3000; automobile tubes, 5500; bicycle tires, 3000. Claimed to be the largest producer in America of strictly domestic tennis balls. New buildings in course of construction will triple present production.

In order to relieve the congestion in housing conditions, which has accompanied the phenomenal growth of the company, the company acquired a plot of 200 acres of land extending from the factory to the Lincoln highway and has inaugurated a building plan whereby fine homes of brick, stucco and frame construction, supplied with all modern conveniences, are sold to its workmen on a modest monthly payment basis. This section is now known as Paruco park, and the number of houses completed or under construction is 71. The minimum of houses planned is 1200.



Plant of the Pennsylvania Rubber Co. at Jeannette, Pa.: 1, Shipping Building; 2, Original Building; 3, Main Office and Factory; 4, Power House; 5, Time Office and Hospital; 6, Paruco Park Homes-for-Workmen Allotment.

OAKLAND HAS COAST COMPANY.

One of the most recent tire concerns to begin operations in California is the Coast Tire & Rubber Co., which has purchased a factory site in Oakland. Production plans call for a plant having a capacity of 300 tires and 500 tubes per eight-hour day. Its capital is $1,000,000.

The chief organizer of the Coast company is Holmes Ives, formerly secretary and sales manager of the Boone Tire & Rubber Co. Interested with Mr. Ives are Harold Geisse, assistant to the vice president of the Middle West Utility Co. of Chicago; W. D. Forbes, an industrial chemist of many years experience; N. B. Campbell, assistant cashier of the First National Bank, Oakland; N. J. Whelan, industrial commissioner of the Wisconsin-Minnesota Light & Power Co., president of the United States Auto Gear Shift Co., and director of the Gillette Tire & Rubber Co. of Wisconsin; John P. Pancratz, sales manager for eastern Wisconsin of the Boone Rubber Tire Co.

Largest Shipment of Crude Rubber

RECEIVED BY GOODYEAR TIRE & RUBBER CO. AT AKRON.

What is stated to be the largest single shipment of crude rubber in the world has arrived in Akron, O., at the plant of the Goodyear Tire & Rubber Co. This is sufficient to supply the entire world for three days, and its total value is approximately $4,412,200.

The shipment consisted of 39,580 200-pound cases, and filled a train of 53 freight cars, stretching nearly half a mile. Each car contained 200 200-pound cases, and the total weight was 7,916,000 pounds. It took 48 men six days to unload this shipment and more than half a million feet of space is required to store it.

This shipment came 10,000 miles and is equal to a year's production from 1,600,000 trees, or from a yield of 16,000 acres of plantation. Although it is to be used for various purposes, it would be sufficient for 700,000 tires if devoted entirely to that purpose.

The shipment went through various forms of transportation, including human, animal, marine and railroad.

GOODYEAR WELFARE PLANS.

Many of the large companies of the country having the welfare of their employees at heart have promulgated plans for reducing the cost of living. The Goodyear Tire & Rubber Co., Akron, O., recently purchased and sold at low prices to its employees, 10 tons of navy beans, 500 cases of corn, 400 cases of baked beans and 250 cases of corned beef.

This company has also recognized the importance of good physical condition on the part of its workmen, by establishing classes in systematic physical training which are held three times a week.

JOYNES TIRE CO. AT NORFOLK.

The Joynes Tire Co. of Richmond, Va., has taken possession of what is said to be one of the largest and most modern tire stores in the South. This concern handles Goodrich tires and tubes, and also conducts an up-to-date vulcanizing department.

NEW MANAGER FOR BALTIMORE MCGRAW BRANCH.

L. L. McAnaney, who has been appointed manager of the Baltimore branch of the McGraw Tire & Rubber Co., Cleveland, O., is one of the best known tire men in the country, having been identified with the industry for the past 17 years.

L. L. McAnaney, Manager Baltimore Branch McGraw Tire & Rubber Co.

Mr. McAnaney started as a stenographer in the factory of the B. F. Goodrich Co. at Akron, O., and was rapidly advanced, being at first salesman in the Boston territory, and later manager of the Goodrich Co.'s branch at Cleveland, O., which position he held for nine years. For four years previous to his engagement with the McGraw Co. he was manager for the Republic Rubber Co., Youngstown, O.

He is sure to receive substantial recognition for his company in the Baltimore territory.

GOODRICH DIVIDEND INCREASED.

The directors of the B. F. Goodrich Co., Akron, O., have voted to place the common stock of that company on a six per cent. annual basis. During the past four years this stock has been paying four per cent. A dividend of 1½ per cent. is payable Feb. 16 to stockholders of record Feb. 5, and one of 3½ has been declared on the preferred stock, the first installment of 1¾ per cent. being payable April 1 and the second July 1.

The net sales of the Goodrich company for the year ending Dec. 31 are reported to have been $141,800,000, and the net profits, before provision for federal taxes, were $17,500,000.

PALMER TIRE CO. FORMED.

The Palmer Tire Corporation has been formed under the laws of Delaware to make rubber tires, etc. Capital, $500,000. Incorporators, M. L. Rogers, T. A. Irwin, W. G. Singer, Wilmington, Del.

LAMBERT "TRUBLPRUF" TIRES.

The Lambert Tire & Rubber Co., Akron, O., is now producing what is claimed to be a really troubleproof tire, the invention of H. M. Lambert, formerly of the Pacific northwest, now of Akron. It is stated that this tire is not only punctureless, but can neither blow out nor give tire trouble of any sort.

Its construction is based upon a stretchless cord belt, B, which, with rubber cushions, takes up and distributes road shocks as the air does in pneumatic tires. The actual functioning of the tire is as follows: The cord belts are so tight and stretchless that when touched they vibrate like a violin string along their entire length, in other words, clear around the tire. When an obstruction or bump in the road strikes the tire, at the point of contact, the stretchless cord belt is pushed up and, therefore, becomes shorter at this point. As a result the cords pull down clear around the tire. The pulling down of the belt compresses the rubber cushions which, being resilient, take up the vibrations. The functioning of the belts and cushions in this way is stated to be shown by the fact that the holes in the tire vary from round to elliptical while the tire is in motion, and that this is the secret of the tire's easy riding qualities.

From its original location at Portland, Ore., the Lambert company expanded to Akron a year ago with the hope that a second plant would produce enough tires to meet the demand. But at the present time both plants are working night and day and it has been found necessary to make additions to the Akron factory to double its production.

"Trublprufs" the trade marked name of these tires, are intended for use on both passenger and truck cars. The claim for them is not only that they afford convenience and freedom from tire delays, but also that they carry an unlimited guarantee, double tire life and a lower proportionate cost a mile.

WADLEIGH IS MANAGER OF FISK.

The Fisk Rubber Co., Chicopee Falls, Mass., has appointed Corliss Wadleigh as manager of its Boston branch. Mr. Wadleigh has been identified with the motor industry for many years. Some eight or 10 years ago he was a prominent factor in the merchandising of Knox motor cars and later joined the sales forces of the Republic Tire Co. and at the time he accepted his present position he was in charge of the eastern department of the Youngstown organization.

SEWELL CUSHION WHEEL CO.

The Sewell Cushion Wheel Co., Detroit, announces the production of specially constructed rubber cushion wheel adapted to one-ton Ford trucks.

The Advance Tire Co. has been incorporated at Little Rock, Ark., with capital of $10,000. The officers are: President, Barr L. Smith; vice president, J. M. Boone; secretary and treasurer, Floyd Branscum.

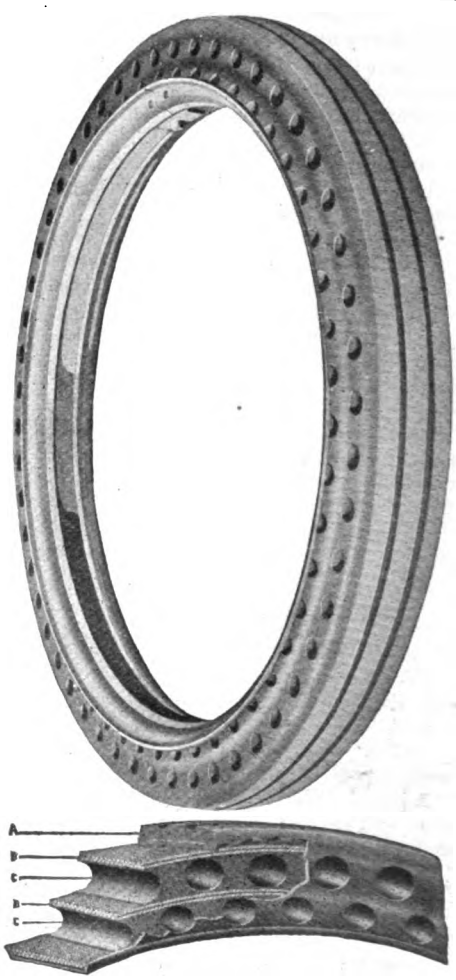
Ninigret Mills Will Make Tire Fabric

The Ninigret Mills Co., which has succeeded the Greene & Daniels Co., Pawtucket, R. I., has been incorporated with a capital of $3,000,000, divided into $2,500,000 preferred and $500,000 common stock, and will manufacture automobile tire yarns and fabrics.

The officers include: President, J. A. Brander, Brander & Curry, Inc., New York City; vice president, Charles F. Broughton, treasurer of the Wamsutta Mills, New Bedford, Mass.; treasurer, H. T. Fiske, Fiske Rubber Co.; first assistant treasurer, Henry Otte; second assistant treasurer, Charles S. Fowler; secretary, Arthur Houghton; clerk, John E. Searle. The Pawtucket plant will be under the management of Mr. Otte.

A second plant, the Ninigret mills, at Westerly, R. I., already equipped with twisting, spooling and weaving machinery, is to have 20,000 spindles added and will be in charge of Mr. Fowler. Both plants are to be overhauled and equipped with up-to-date machinery for tire fabrics.

A tire manufacturing company, to be capitalized at $3,000,000, has been organized by a group of St. Louis and Chicago men and will at once begin the construction of a factory on the site of the Autenreith hotel, St. Louis.



Lambert Trubipruf Tire with Cross Section Showing Construction.

Promotions Announced by Firestone Tire & Rubber Co.

PRESIDENT H. S. FIRESTONE of the Firestone Tire & Rubber Co., Akron, O., has announced the following promotions:

E. W. BeSaw, who has been western sales manager for three years, with headquarters in Akron, is made general sales manager, succeeding A. B. Partridge; F. K. Starbird, district chief, with headquarters at Minneapolis, Minn., becomes western sales manager; J. E. Mayl, district chief at Boston, is made eastern sales manager.

J. E. Mayl, Eastern Sales Manager, Firestone Tire & Rubber Co.

Mr. BeSaw joined the Firestone forces nine years ago as a salesman in Iowa. In a short time he had become manager of the Des Moines branch and on account of his fine record was called to the general offices, where he soon became manager of the western sales division. Mr. Starbird became associated with the Firestone organization four years ago in the advertising department. Before becoming a district manager a year ago he was sales manager of the pneumatic department. Mr. Mayl started with Firestone in 1911 as a salesman in St. Louis. Four years later he was placed in charge of the Memphis branch. He was manager of the Cleveland branch from the spring of 1917 until he became a district manager last year.

Changes affecting the district manager personnel are as follows:

J. P. Patterson, manager of the Cincinnati, O., branch, has been appointed manager of the south central district, with headquarters in Cincinnati.

J. H. McDonough, district representative of the central district, has been made manager of the southwestern district, with headquarters in Dallas, Tex.

C. L. Mason, western service manager, goes to Akron, O., as manager of the north central district.

L. R. Jackson, manager of the Indianapolis branch, has been appointed manager of the Pacific coast district, with headquarters in San Francisco.

B. R. Leisure, manager of the Baltimore branch, has been made district manager, with headquarters in Philadelphia.

Changes in branch management are announced as follows:

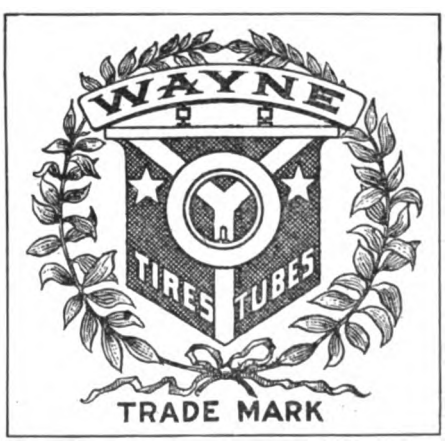
E. W. BeSaw, General Sales Manager, Firestone Tire & Rubber Co.

Cleveland, O., J. M. Bushey, formerly truck tire sales manager at Cincinnati, vice P. M. Pontius, resigned; Washington, E. D. Manley of the same branch, vice W. M. MacNichol, transferred; Baltimore, M. M. MacNichol, vice B. R. Leisure, promoted; Philadelphia, R. L. Harpham, formerly manager of truck tire sales in eastern division, vice W. R. Walton, transferred to manufacturers' sales; Harrisburg, G. C. Bacon, formerly manager of Akron branch, vice J. H. Dutch, transferred to manufacturers' sales; St. Louis, T. J. Barry, formerly district representative, vice F. C. Rudisell, resigned; Denver, G. K. Meeks, formerly manager of Memphis branch; Detroit, G. E. Burkit, formerly manager of Toledo branch, vice R. H. Jeffers, promoted; Toledo, G. F. Guin, formerly trade sales manager of same branch, vice G. E. Burkit, transferred; Indianapolis, C. T. Barnes, formerly trade sales manager of the same branch, vice L. R. Jackson, promoted; Memphis, L. L. Heidacher, formerly district truck tire representative, vice G. K. Meeks, transferred; Cincinnati, J. F. Evans, formerly trade sales manager of the same branch, vice J. P. Patterson, promoted; Duluth depot, J. L. Bain, formerly district representative.

F. K. Starbird, Western Sales Manager, Firestone Tire & Rubber Co.

FORT WAYNE CO.'S NEW TRADE MARK.

The Fort Wayne Tire & Rubber Manufacturing Co., Fort Wayne, Ind., has adopted a new trade mark which will be used on all its products, molded in the tires and printed on the tubes. The design consists of a wreath of the leaves of the rubber tree surrounding the two-starred flag of Fort Wayne, which has been adapted to form a shield, the device signifying the unification of three rivers. An automobile tire holds the center of the design. Surmounting the shield is the word "Wayne" and below on the extreme bottom are the words "Tires" and "Tubes" at the left and right respectively. This is the $100 prize winning design submitted by Walter Johnson of South Bend and A. L. Callahan of Fort Wayne, Ind. This company produces both the Wayne cord and fabric tires. The general manager is Vice President J. C. Brown and the secretary and treasurer is L. E. Kraft.



REMOVAL OF NEEDHAM TIRES.

The Needham Tire & Rubber Co. has moved to 245 West 59th street, New York City. Since the first of the year this company has been appointed metropolitan distributor of Needham tires, made at Needham, Mass.

DAWSON TIRE & SUPPLY.

The Dawson Tire & Supply Co. has been organized at Newark, N. J., for the purpose of manufacturing tires, supplies, etc. Capital, $75,000.

Sterling Elects New President

At a meeting of the board of directors of the Sterling Tire Corporation, held at its office in Rutherford, N. J., Dec. 26, A. A. Altschuler of Hackensack was elected president to succeed Spencer Welton, resigned. Mr. Altschuler has been a director of the corporation for several years and is also president of the International Fidelity Insurance Co. and a director of the Union Trust Co. of Jersey City.

Succeeding Mr. Welton on the board of directors is Frank A. Ball, vice president of the L. S. Starrett Manufacturing Co., Athol, Mass. The other officials remain as follows: Vice president and general factory manager, Otto Basten; treasurer, Joseph A. Miller; secretary, Bartlett Greene; chairman, executive committee, Charles Austin Bates.

The Sterling Corporation reports that it has just closed the most successful year in its history, having changed its selling policy from retail to wholesale and opened accounts with over 5000 dealers from Maine to California. It has unfulfilled orders and contracts for 1920 delivery amounting to over $2,000,000. During the past year an export department has been developed and Sterling tires are now sold in more than 30 foreign countries. The plant in East Rutherford has been materially enlarged and now has a capacity of 1200 tires a day. Further additions are planned to bring the production to 2000 a day before the end of 1920, which will mean the employment of double the number of men at work in 1919.

RECORD REBUILT TIRES.

The Record Tire Co., New York City, conducts its business on the principal of guaranteeing all the tires put out for 5000 miles, this policy insuring that no tire will be rebuilt unless, after tearing down, the carcass is found to possess sufficient strength to make good on this amount of mileage.

Another way in which the company protects itself is by not selling state manufacturing rights, but by handling all tires to be rebuilt in its own factories and by its own expert workmen.

DUNLOP TO BUILD AT BUFFALO.

The newly incorporated Dunlop, America, Ltd., an extension of the British Dunlop Co., is to erect a tire plant and cotton mills in Buffalo, N. Y., at a cost of about $25,000,000. All the rights of the American Dunlop Tire Co. have been acquired by Dunlop, America, Ltd., but it will be operated by an American executive staff, and the board of directors will be made up of Americans, as well as representatives of the British interests.

KEYSTONE SALES INCREASE.

The gross sales of the Keystone Tire & Rubber Co., New York City, for the past year amounted to $9,806,000, compared to $6,172,000 in 1918.

OLDFIELD TIRE EXPANDS.

On account of the record-breaking growth of the Oldfield Tire Co.'s business, making it impracticable for him to longer discharge the combined duties of president and general manager, Barney Oldfield announces the addition to his organization of H. A. Grubb, a tire industry executive of ripe experience and wide acquaintance. Mr. Grubb's connection with the Oldfield company as vice president and acting general manager, with headquarters at Cleveland, will enable President Oldfield to devote an increased proportion of his time to supervision of production and to the company's sales activities in the field.

The Oldfield company has added to its

H. A. Grubb, Vice President and Acting General Manager, Oldfield Tire Co.

directorate besides Mr. Grubb, O. C. Wagner, credit manager, and C. L. Reely, advertising manager, who also assumes the duties of assistant sales manager.

HOOD RUBBER STOCK.

The Hood Rubber Co. is offering stockholders an opportunity to subscribe to $1,000,000 seven per cent. cumulative preferred stock of the Hood Rubber Co. at $100 a share. A contract has been entered into between the two companies whereby the rubber company agrees to pay a net commission of one per cent. after the payment of all expenses and liability incurred in the conduct of the business.

Based on sales of $25,000,000 for 1918 and 1919, from this one per cent., the Hood Rubber Products Co. would receive $250,000, or three times the requirements of the preferred stock. Under the contract the Hood Rubber Co. guarantees $100,000 annually. All the stock was bought by the Hood Rubber Co., the preferred now being offered to stockholders, while the $500,000 common will be retained. In case of liquidation the preferred is entitled to $110 a share, and is also callable in whole or in part at $115 a share.

New Plant for Kelley Tire Company

The Kelley Tire & Rubber Co., New Haven, Conn., is to build a new factory on a five-acre lot recently purchased at West Haven. It will cost approximately $650,000, will be of concrete construction and will adjoin the main line of the New York, New Haven & Hartford railroad, to which an electrically-equipped spur track will be connected.

The company proposes to concentrate all its manufacturing operations in this new factory, which will afford a total floor space of 65,000 square feet. The first floor will be devoted to shipping and receiving rooms and will contain the heavy machinery such as mills, calendars, etc. On the second floor will be made Kelley Kord tires, and the third will be used exclusively for the manufacture of Kelley "Blue" tubes. The basement will be devoted to storage.

The personnel of the Kelley Tire & Rubber Co. includes the following: President, E. J. Kelley, New Haven, Conn., formerly a prominent railroad official; vice president and treasurer, Charles H. Bortell, Jr., former sales manager of the M. M. Green Co. and National Mileage Co.; secretary and general counsel, William F. Alcorn; factory manager, E. Raymond Thresby.

NEW FACTORY FOR BRUNSWICK TIRES.

When the pneumatic automobile tire first came into use the Brunswick-Balke Collender Co., long before known as a manufacturer of high class billiard tables, gave serious thought to making tires in its plant at Muskegon, Mich., which has been established for making billiard table cushions, and different kinds of hard rubber goods.

The first tires were turned out in 1909, but it was not till 1916 that this branch was put on a basis of actual production, and the following year the Brunswick tire was marketed. Since that time its progress has been rapid and ground is to be broken in the early spring for additions which will quadruple the present output.

INDIA CO. INCREASES CAPITAL TO $5,000,000.

The India Tire & Rubber Co., Akron, O., has increased its capital from $1,500,000 to $5,000,000. Part of this is to be set aside for purchase by employees and expansions to the plant at Megadore will also be provided for.

HANES RUBBER CO. FORMED.

The Hanes Rubber Co. of New York has been incorporated at New York City with capital of $10,000 to deal in pneumatic tires. The incorporators are E. A. Machlin, W. T. H. Reilly and R. L. Delisser, 135 West 79th street, New York City.

Goodyear Co.'s Relief Association

The system by which the Goodyear Tire & Rubber Co., Akron, O., conducts relief work among the 25,000 employees in its Akron factories, has proved so successful that the company has received many inquiries from other industrial concerns in regard to its method of operation.

Over 15 000 employees, two-thirds of the total enrollment in Akron, carry insurance in the men's relief association. Each member pays dues of $6 a year in return for which he receives a $1000 policy and is entitled to $8 a week when laid up by accident or illness. Without additional cost the policy is increased $500 every five years until it reaches a maximum of $3000. This extra insurance is in reality a bonus for long service.

The woman's branch of the relief association has 1300 members.

An idea of the benefit such a plan is to Goodyear employees and their families may be gained when it is known that in the six months ending Jan. 1, 1920, the association paid out $12,000 for deaths and $11,988 for accidents and sickness.

The membership increased over 7000 in the past five months and it is expected that 1200 more will become members during January.

Engages in Cotton Growing.

Cotton growing in Arizona is no longer in the experimental stage, as thousands of acres are under cultivation, producing large amounts suitable for tire fabric. Irrigation has turned sandy wastes into fertile plantations that produce cotton equal in quality to Sea Island. The Goodyear Tire & Rubber Co., Akron, O., was one of the pioneers in this field, and so successful have been its efforts that it has established connections in the Imperial valley of southern California and construction will soon begin on gins in Calexico, Calapatria and probably El Centro.

To Build $200,000 Dormitory.

The Goodyear Tire & Rubber Co., Akron, O., has let contracts for a $200,000 dormitory to house 175 of its women employees from out of town who would otherwise find it difficult to find suitable places in which to live at a reasonable rental.

WATKINS HEADS GLOBE TIRE.

L. Arthur Watkins, one of Boston's best known automobile accessory men, and especially prominent in the tire trade, has been promoted to be New England district manager of the Globe Tire Co. He will make his headquarters at Boston. Mr. Watkins was, in 1911, chosen president of Motor Accessories, Inc., operating as John & Arthur. In 1916 he resigned from the company and enlisted in the army for the duration of the war. In January, 1919, he returned to Boston and became associated with the Globe Tire Co. as traveling representative. As head of the Globe company for this district he succeeds A. H. Lane, who goes to factory headquarters as distributors' representative.

BATAVIA RUBBER SUES KEYSTONE.

The Batavia Rubber Co. Batavia, N. Y., has brought suit against the Keystone Tire & Rubber Co., New York, dealer in tires, with branches in many cities, for damages for breach of contract. The Batavia company claims that in the spring it contracted with the Keystone company for the sale of its entire output for five years, and the contract was filled until about the middle of November the Keystone company refused to buy any more tires, claiming that they had been made smaller and inferior to what the contract called for.

The Batavia officials allege that the tires have been made according to the specified written requests of representatives of the Keystone Co. The Batavia company also states that in order to fulfill this contract it began to operate its plant with three shifts, 24 hours a day, with the exception of Sundays, until about the first of November, when it changed to two shifts of 10 hours each. The plant was enlarged and land purchased for factory purposes.

STERLING TIRE DISTRIBUTORS.

The Sterling Tire Corporation, Rutherford, N. J., announces the appointment of the following distributors: George L. Watkins of Birmingham, Ala., for the State of Alabama; West Coast Rubber Co. and Oregon Rubber Co., both of Seattle, Wash., for the northwest section; Charles A. Warren, San Francisco, for northern California, with headquarters at 575 Market street. Mr. Warren has appointed the firm of Maundrell & Walfish to care for the distribution in the city of San Francisco.

MUTES IN THE RUBBER INDUSTRY.

Persons who are deprived of speech have been found to be specially adapted to certain classes of work in the rubber industry, and the number employed at Akron alone is nearly 1000. In fact, in some of the larger factories entire departments consist of mutes, and their work is said to be of a high standard.

U. S. RUBBER PURCHASE.

The United States Rubber Co., New York City, announces the purchase of the entire plant, equipment, stock, good will and business of the Dolgeville Felt Shoe Co., Dolgeville, N. Y., manufacturer of felt shoes and slippers.

ASSOCIATED TIRE STORES.

The Associated Tire Stores Corporation has been incorporated at Dover, Del., with capital of $30,000,000, to manufacture tires, etc. The incorporators are T. L. Croteau, M. A. Bruce and S. E. Dill, Wilmington, Del.

The Alling Rubber Co., Albany, N. Y., has increased its capital from $225,000 to $450,000.

Market for Tires in England

It is reported that manufacturers here who are in a position to export motor car and motorcycle tires at the present time will find the British market worthy of attention. Makers of cars and cycles in that country are faced with what might almost be termed a tire famine. While it is realized that the present tire shortage is world wide, it is evidently more acute in Europe than in this country, as central Europe has not yet recovered from the effects of the blockade, which prevented the coming in of both crude rubber and the finished product during the war.

In the United Kingdom it is reported that the output of cars and cycles is seriously impeded by the dearth of tires, with no immediate prospect of relief. The growers of rubber, although otherwise in a position to ease the situation are hampered by the meagerness of shipping facilities, and it is anticipated that many months must elapse before factories can expect appreciable relief in the way of raw material.

Rubber growers, as well as manufacturers, realize that the restoring of production to a pre-war basis will not solve the problem, as the demand for motor cars is so much greater than in 1914, and more raw material must be produced if the supply is to keep pace with the demand.

PERFECTION CO. TO USE OWN BRAND.

It is reported that the Perfection Tire Co. is now concentrating its efforts upon the production of tires and tubes carrying its own brand, having abrogated its contract with the Keystone Co. so as to meet production requirements under its selling arrangement with the Nemours Trading Corporation.

INTERNATIONAL TUBE CORPORATION.

The International Puncture Proof Tube Corporation has been incorporated at Wilmington, Del., to manufacture puncture proof inner tubes for automobile tires, etc., with capital of $5,000,000. The incorporators are Samuel B. Howard, George V. Reilly and Robert K. Thistle, all of New York.

FOREMOST CORD TIRES.

The United Motors Service is now ready to distribute to tire dealers through its branches the Foremost cord tire, which is built to the exclusive specifications of the company.

The United Motors Service maintains branches in 22 cities and has 150 authorized distributors, for handling high grade automotive equipment and furnishing service on Delco, Klaxon and Remy products.

Goodyear Industrial Republic in Successful Operation

A NEW departure in the method of establishing more friendly relations between the management and employees of a big industry has been successfully tried out for six months by the Goodyear Tire & Rubber Co., Akron, O., where an industrial assembly composed of 20 senators and 40 assemblymen, chosen from the ranks of 25,000 workers, pass all laws affecting the conduct and welfare of the men.

So satisfactory has been the work of this body during its brief existence in settling incipient strikes and improving working conditions of employees in various parts of the company's plant, that plans are now being made to provide a legislative hall in the new million dollar club house that will be finished early in the year.

The new assembly functions in the same manner as state and national legislatures. The seating arrangement in each house will be the same as that in the national and state capitols. Each will have a rostrum, desks and galleries for spectators and members will make all arguments under the rules of parliamentary law.

E. J. Hard is president of the senate and J. B. Long is speaker of the house. Both are from the ranks of the employees. P. W. Litchfield, vice president and factory manager, stands in the same relation to the assembly as the President of the United States to Congress. The power of veto is vested in him, but the assembly can pass any measure over his veto by a two-thirds vote. A measure so passed goes to the board of directors of the company for final decision.

There are many similar plans of handling labor problems in operation in many industrial concerns throughout the country, but the Goodyear plan differs in the fact that members of both house and senate are representatives selected by employees, whereas in many other concerns the senate is composed of repre-

P. W. Litchfield, Vice President of Goodyear Co., Acts as President of Industrial Republic.

sentatives of the employer and the house composed of factory representatives. This tends to a deadlock and no solution of a problem.

Excellent Results Attained.

Commenting on the excellent results so far attained by the assembly, F. A. Seiberling, president of the company, declared in a recent address to employees, "it is hard to conceive that any of the recommendations of the assembly will be denied by the board of directors."

At the time of his address the assembly had already enacted laws providing for Saturday half holidays in all departments. A "tardy" rule which "docked" the men an hour and a half for being late was modified so that they now lose but 15 minutes. Unusual traffic conditions exist and make it difficult to report on time. This latter rule greatly impressed the workers with the efficiency and power of the assembly for proper corrective measures. The assembly's power was evidenced recently when complaints and requests for better trolley service were made by Goodyear to the traction company. No results were obtained. When the assembly representing 25,000 workers made the request immediate action was taken by the trolley company.

Laws making all shifts permanent have been enacted. Legislative action has been taken to adjust several threatened strikes.

When a machinists' strike was called in Akron recently, only 40 per cent. of Goodyear's machinists responded. In a few weeks they returned to work. All were returned to their old jobs by the assembly without being penalized, thereby cementing the relationship between the men and the company.

That the assembly is perhaps the nearest possible approach to an "industrial republic," and that Goodyear has the confidence and interest of its workers was evidenced in the recent sale of the company's preferred stock when 17,101 employees subscribed to $7,700,000 worth of stock. This gives Goodyear the largest number of employee stockholders of any company in the world with the exception of the United States Steel Corporation.

Civic Betterment.

The assembly also participates in movements for civic betterment. Unanimous indorsement was recently given to several bond issues to provide for a tuberculosis sanitarium, a new viaduct and $6,000,000 for improving the city water system.

Election rules governing the assembly provide that the factory be divided into 40 precincts. Each precinct elects one member to the assembly, called a representative. He shall not be less than 21 years old and have a continuous factory record of one year. The term is 12 months.

The precincts are further arranged into 10 districts, each district electing two senators who serve for a two-year period. Candidates for this office must be not less than 25 years old and have a continuous record of five years in the factory.

The voters are called industrians. An industrian must have a continuous record of at least six months in the factory, must speak English and be an American citizen.

Oath of Office.

The industrial republic plan was approved and adopted by a vote of employees in June, 1919, and the first election was held a few weeks later. Each new official, upon entering into office, took the following oath: "I solemnly swear that I will faithfully support the constitution and laws of the United States and the State of Ohio, the industrial representation plan of the factory, and that I will discharge to the best of my ability, faithfully and conscientiously, the duties incumbent on me as a member of the assembly."

Senate of Goodyear Industrial Republic in Session at Company's Plant in Headquarters at Akron, O.

Digitized by Google

K. J. Hard, President of Senate, Goodyear Industrial Republic.

The plan also guarantees that there shall be no discrimination against any Goodyearite on account of membership or non-membership in any labor organization, or against any member of the assembly for action taken by him in performance of his duties as outlined in the plan.

It is expressly stated that the assembly shall have the right to change factory rules and regulations which from time to time have been made by the management.

This body has already promoted conferences between committees named from its own bodies and representatives of the management. While the body does not meet until the first Monday of each month, certain of its officers and committees are in weekly conference with the factory manager and executive heads.

Bosses Eliminated.

One noticeable effect in the six months operation of this unique legislative plan has been the elimination of the old-time slave-driving shop boss. The conduct of the harsh foreman is always a subject of review in the assembly upon complaint of an industrian. Where before production was quickened under the watchful eye of a not too lenient overseer, it is now speeded up by the hope of reward and the promotion that follows in the wake of initiative and good work.

Of all plans tried by the company to promote industrial relations the assembly plan is believed by Goodyear to be the best. Frank and open discussion of all things relating to the employees' welfare can be brought before the management at a moment's notice.

The industrial assembly frequently invites the officials of the company to speak to them as well as outsiders. Anyone can attend a meeting, but the sessions are in no way dominated by officials. In fact they seldom attend unless invited. Recently Lillian Russell and Ole Hansen, former mayor of Seattle, spoke to the assembly. The reason for securing these speakers is that the assembly members may keep in touch with the best modern thought for improving the conditions surrounding workers.

SUCCESSFUL MEMBERSHIP DRIVE.

As a result to date of the membership drive the New York Electrical society inaugurated last September, 115 names have been added to the roles. It has never been difficult for this, the oldest organization in this field, to obtain new members, as its meetings have always been well attended and the programmes are carefully planned so as to be neither solely technical nor, on the other hand, strictly commercial, but to preserve an even balance.

The society's membership includes many men noted in the electrical world today. In addition to the 115 new members, 292 have renewed their active interest in the organization. The drive will continue for four months more.

QUALITY METHODS AT PIERCE-ARROW FACTORY.

From 12,000 to 14,000 visitors register at the factory of the Pierce-Arrow Motor Car Co. at Buffalo, N. Y., every year, many of them being users or prospective users of Pierce-Arrow cars and trucks.

Courteous guides are furnished to accompany visitors on trips of inspection through the machine and assembling shops, test buildings, body shops, chemical laboratories, power house, inspection departments and other parts of the factory, and when a visitor sees with his own eyes the kind of materials used. the tests to which they are subjected, the accuracy with which they are machined. the precautions taken to insure this accuracy, the system of inspection followed throughout manufacture. and the thoroughness of final testing, he gains a clear knowledge of what is meant by Pierce-Arrow standards of quality.

"COLUMBIA HOT SHOT."

The second number of the house organ started in November by the National Carbon Co., Inc., Cleveland, O., has made its appearance under the name of "Columbia Hot Shot," this being the title selected out of a large list suggested. The

J. B. Long, Speaker of House, Goodyear Industrial Republic.

board of editors is as follows: Honorary editor-in-chief, N. C. Cotabish, general sales manager; directing editors, H. S. Greene, assistant sales manager; A. Broggini, publicity manager, and S. M. Masse. It is the purpose of the editors to make every item in the paper a hot shot and one that is aimed to hit the mark.

TIRE CHANGED IN 61 SECONDS.

Francis P. Doherty of the Pitts Auto Supply Co., Lowell, Mass., has some ground for claiming the title of "champion" in the tire changing line. Recently, in the presence of competent witnesses, he shifted a Ford tire in exactly one minute and one second, the operation including removing the tire from an iron rim, pulling out the inner tube, replacing the tube, replacing the tire and inflating it to 60 pounds pressure. The size of the tire was 30 by 3½. His record for a 35 by 5-inch tire is two minutes, and it is claimed that he also holds all records for the removal and replacement of solid rubber tires.

The first six-cylinder motor car was produced in England.

Personal News of the Industry in Brief

Jay V. Hall Joins Willys Corporation

Jay V. Hall, formerly sales manager and a member of the executive committee of the Olds Motor Works, has been

Jay V. Hall, Vice President in Charge of Car Production, Willys Corporation.

made vice prseident in charge of motor car production of the Willys Corporation, Toledo, O., and will have complete oversight of the new light six-cylinder car. He will be assisted by D. F. Edwards, who for two years was assistant to the president of the General Motors Co.

John H. Johnson, owner of the Buick-Boston Co., has opened his new motor service building just off Commonwealth avenue in Boston's new motor mart section and it is said to be a marvel of completeness, representing an investment of $300,000. These new quarters have enabled Mr. Johnson to divide his extensive business into 18 different departments. each under the supervision of an expert. Here is afforded some 70,000 square feet of floor space all to be devoted to service, as the sales rooms will continue on Massachusetts avenue, and storage is cared for in still another building. Mr. Johnson has been a director of the National Automobile Dealers' association.

Harry Garner of South Orange street, Philadelphia, who recently purchased the property at the northeast corner of State and Plum streets in that city, plans to remodel the building into an up-to-date automobile tire repair shop.

Harry Harmer, for the past seven years connected with the White company in charge of its national users business, has become identified with the Service Motor Truck Co. as Chicago branch manager.

H. F. Clark and C. A. Clark, formerly with the Universal Motor Co., have joined the Yale Automobile Co., Little Rock, Ark.

Howard B. Hall, vice president of the Bethlehem Motors Corporation, and director of the export activities of that corporation, has resigned, to become effective Feb. 1. Mr. Hall was one of the first to join Arthur T. Murray in the organization of the Bethlehem Corporation in 1916, severing his connection with the Brady Murray Motors Corporation to become Bethlehem's assistant sales manager. Mr. Hall later, while retaining his factory interest, organized the Chicago Bethlehem Sales Co. for the distribution of Bethlehem Products in the Middle West. He returned to New York early last year and became actively engaged in the export plans of the company. He has not yet announced his future plans.

Edward W. Keefer, who was with the 28th Division Expeditionary Forces in France, is now back in his former position as eastern traveling representative of the Bearings Co. of America, Lancaster, Pa.

L. L. Newton has resigned his connection with the Parker Motor Truck, where he has been sales manager for the past 15 months.

George W. Barranger has rejoined the Baltimore Republic Truck Co., 131 West North avenue, Baltimore, Md., as salesman.

H. C. Doss has been appointed manager of the Ford Motor Co. of Oklahoma. He was formerly assistant manager of that company.

M. W. Franklin is the new director of the inspection, service and personnel division of the Remy Electric Co., Anderson, Ind., to succeed J. D. Hopper. Mr. Franklin has had an usually wide experience, is a doctor of science, master of arts, electrical engineer and physical chemist, holding degrees from the University of California. Columbia University and the University of Goettingen, Germany.

M. W. Franklin, Promoted to Important Position with Remy Electric Co.

Davies Vice President Seelye & Brown

Maxton R. Davies, vice president and secretary of the Dunlap, Ward Advertising Co., Cleveland, O., and formerly man-

Maxton R. Davies, Vice President Advertising House of Seelye & Brown, Inc.

ager of that agency's Detroit office, has returned to Detroit to become vice president of Seelye & Brown, Inc., advertising agency, where he will serve as counsel on automotive advertising and sales. Mr. Davies is well known in the automobile and allied industries, having been prominently identified with the publicity work in behalf of Chandler, Cleveland and Grant motor cars.

E. A. Bates has accepted the position as president and general manager of the Booty Carburetor & Manufacturing Co., Chicago, Ill. He was formerly connected with Benecke & Kropf.

Earl W. McGookin is now acting as sales manager for the Curatex Co., Newark, N. J., in his former office at 720 Book building, Detroit.

Roy D. Hertz, who recently resigned as general sales manager of the Moreland Motor Truck Co., will take a brief rest before again taking up the automobile industry.

J. W. Locke has joined the force of the W. W. Williams Co. of Columbus, O. Mr. Locke was formerly with the Commerce Motor Car Co. of Detroit.

John H. Dwight has accepted the position of assistant general manager of the Saginaw Products Co., Saginaw, Mich., having been formerly vice president and general manager of the Belle City Malleable Iron Co. and Racine Steel Castings Co., Racine, Wis.

J. E. Iams, manager of the Winton Philadelphia branch, states that the new show rooms and offices at 1404-1406 North Broad street are about ready for occupancy.

Berlet President Truck Association

E. J. Berlet, president of the Stability Motors Co. of Philadelphia, agent for Atterbury trucks, has been elected president of the Philadelphia Motor Truck Association, the dealer organization of that city. Mr. Berlet is known as one of the most active interests in the trade and keenly concerned in the success of the annual auto show in that city, which took place this month. His company has taken a prominent part in various public promotive movements in Philadelphia.

E. J. Berlet, New President of the Philadelphia Motor Truck Association.

E. E. Seig has been promoted from head of the credit department of the Republic Motor Truck Co., Alma, Mich., to assistant general sales manager. Mr. Seig has been with the Republic company since its organization, and as he has advanced through the various divisions he is thoroughly familiar with the policies of the company. He will be succeeded in the credit department by W. R. Tomlin, who has been his assistant.

R. B. Fisher has been appointed general sales manager of the Buda Co., Harvey, Ill., and will direct all domestic and foreign sales and the advertising department. John P. Mahoney will continue as sales manager of the engine division and S. Gordon Hyde as advertising manager, both under Mr. Fisher's supervision.

R. W. Stovel, who was a lieutenant-colonel in the United States Engineering Corps, has been appointed a consulting engineer with Westinghouse, Church, Kerr & Co. He will devote his entire time to electrical and mechanical features.

V. L. Brown has resigned his position of retail sales manager of the Overland Hanson Co., Waterloo, Ind., and R. A. Doty has succeeded him.

Walter W. Gaskill, 141 Milk street, Boston, Mass., has been appointed by the Roller-Smith Co., New York City, as its agent for Boston and vicinity and other parts of the New England territory.

Wilbur W. Wood, who for many years has been a writer for St. Louis newspapers, has become connected with the Traffic Motor Truck Corporation of that city in the publicity department in charge of local and national advertising. In connection with the duties of his new position Mr. Wood will edit "Horse Sense," the monthly house organ of the Traffic Corporation, as well as the "Weekly Wallop," the internal house organ. During the war Mr. Wood was in the Naval Aviation service and was editor of the "Pauillac Pilot," a weekly publication in France devoted to the interests of the aviation service.

Lloyd J. Bohan, who for the past three years has been connected with the Gurney Ball Bearing Co., Chicago, has joined the Torbensen Axle Co. as sales representative in Chicago and territory west of that point.

E. F. Norelius has opened consulting and designing engineering offices at 430-431 Andrus building, Minneapolis, Minn. He was formerly with the Holt Manufacturing Co. for 10 years in different engineering capacities and during the war was identified with the design and development of artillery tractors.

E. B. Barber has joined the manufacturing forces of the LaFayette Motors Co. at Indianapolis, Ind. He was formerly with the Blodgett Engineering & Tool Co., his position being chief tool engineer and he is widely known in engineering circles.

Austin Parker of New York, who was in the war zone for the New York Tribune, has joined the Packard organization as director of publicity.

E. A. Shelly, who for some time past has been assistant sales manager of the Selden Truck Corporation, Rochester, N. Y., died at his home in that city on Jan. 19 after a week's illness. Prior to his connection with the Selden organization he was for a number of years with the Vim Motor Truck Co., Philadelphia. He leaves a wife and daughter.

E. A. Shelly, Assistant Sales Manager, Selden Truck Corporation.

Storm with Sewell Wheel Company

Fred J. Storm has been appointed assistant general manager of the Sewell Cushion Wheel Co., Detroit. Mr. Storm has been closely allied with the motor truck industry and is therefore well equipped to take over his new duties, which will place him in complete charge of the merchandising of Sewell cushion wheels.

F. J. Storm, Assistant General Manager, Sewell Cushion Wheel Co.

H. C. Carter has been appointed factory manager of the Napoleon Motors Co., Traverse City, Mich. He was for a number of years with the Dort Motor Car Co., Flint, Mich., leaving that concern to organize the inspection department of the Republic Motor Truck Co., Alma, Mich., of which he later became chief inspector. Mr. Carter is a man of broad experience both in the truck field and in all branches of the automotive industry.

A. L. Kimball, formerly chief engineer of the Fulton Motor Truck Co., is now sales engineer for the Pierce Governor Co., Anderson, Ind., having charge of the territory east of Indiana. Mr. Kimball is a man of wide experience in the automotive industry, having previously been experimental engineer with the Hudson, Chalmers and Dodge Brothers car companies. He is a graduate of the University of Michigan and is a member of the Society of Automotive Engineers.

Flavius G. W. Sudrow has resigned his position as zone sales manager of the Chevrolet Motor Co. of Kansas City, Kan., to become distributor for the Gardner Motor Co. in that city and the southwest. He was also formerly treasurer of the St. Louis Body Co.

Ralph N. Soule, who has had a long and very successful enginering experience, has been appointed manager of the service department of the Dort Motor Car Co. of Flint, Mich.

Randall General Sales Manager, Cadillac

A. E. Randall has been appointed general sales manager of the Detroit Cadillac Motor Car Co. to succeed Hugh T. Porter, who has gone with the Lafayette Co. Mr. Randall has been connected with Detroit Cadillac Co. for 10 years as manager of the Brooklyn, N. Y. branch, and was at one time president of the Brooklyn Motor Vehicle Dealers' association and a member of its show committee for several years. Mr. Randall's New York City headquarters will be at 1881 Broadway, but he will also continue in charge of the Brooklyn branch at Lafayette and Flatbush avenues.

Thomas J. Blick, Ford dealer at 257 Broadway, Buffalo, N. Y., has recently renovated and enlarged his place of business. Mr. Blick put his business on a profit sharing basis last September, since which time his records show a decrease in losses in doing business of 65%. His headquarters, with the new additions, will include 7500 feet of floor space. William E. English is the superintendent of Mr. Blick's service department.

Thomas T. Feeley, Lockport, N. Y., has retired from the position of county clerk and has accepted a position with the General Motors Corporation. Mr. Feeley was county clerk for nine years and declined renomination.

Allan A. Ryan of New York has been elected chairman of the board of directors, Stromberg Carburetor Co. of America.

Gus Menninger of Fort Smith, Ark., has been appointed active manager over all departments of the Creekmore Motor Co. Mr. Menninger was formerly sales manager.

William A. Turner of Baltimore, Md., who served several months overseas with the United States army, has been appointed sales manager of the Brockway Motor Truck Co. of Baltimore, 1921-1927 North Charles street.

Walter Lockhart has opened a garage and repair shop in the building formerly occupied by the Sunshine laundry at 511 North Fifth street, Waco, Tex. Mr. Lockhart was formerly traveling mechanic for the White Motors Co.

Jack Richardson and E. R. Shirley have accepted positions with the Butler-Williams Motor Co. of Oklahoma City, Okla., selling the Patriot truck, both in the retail sales department.

Harry Fosdick has purchased an interest in the Monroe Motor Car Co., Buffalo, N. Y. He was for a long time prominently identified with the Nordyke & Marmon Co., Indianapolis, Ind.

Edwin L. Lewis, who has been a member of the Packard forces since July, 1918, has been appointed to the position of assistant general manager of the Packard Motor Car Co. of Philadelphia.

Joseph F. Downey, dealer in high grade used cars, has opened his new quarters at 651 Beacon street, Boston, which includes sales rooms and a service station.

William A. Kuser has introduced a novel service feature for Lexington owners and other motorists by installing an automobile license bureau in his show room where detailed information on the new and complicated Pennsylvania license law can be secured, thus saving the trouble of sending to the state capital. It is the only bureau of the kind in the city. Mr. Kuser is vice president of the Lexington Motor Co. of Pennsylvania.

Al Adams, the oldest used car dealer in New England, handling all the high grade cars, has moved to the New Charles Street Garage. For the past 15 years he has been located at Park square, Boston, Mass.

A. R. Demory has been elected president of the Timken Detroit Axle Co., Detroit, Mich., the former president being Mr. Timken.

William Luttgen has been made president and general manager of the Mercedes Repair Co., at 218 East 55th street, New York City. The Mercedes car is made by the Daimler Motor Co. of Stuttgart, Germany, and Mr Luttgen has been granted the sole selling rights for America and is now placing agencies throughout the country.

A. G. Ripberger has become chief engineer for the steel and tube department of the main plant of the Timken Roller Bearing Co. at Canton, O. Mr. Ripberger was formerly of the engineering staff of the Illinois Steel Co., Gary, Ind.

Dan Goodman has taken over the Craig garage in Paris, Ill. He has been for the past three years advertising manager of the Ford Motor Co. in Indianapolis, Ind. He will, however, still handle the Ford car in Edgar county.

GROUP OF NEWLY ELECTED VICE

Thomas Clements, Vice President, Firestone Tire & Rubber Co., in Charge of Offices and Purchases.

Mr. Clements joined the staff of the Firestone Co. about two years ago as comptroller, coming from the position of general manager of the Woods Motor Vehicle Co.

J. W. Thomas, Vice President, Firestone Tire & Rubber Co., in Charge of Manufacturing.

Mr. Thomas has been works manager for some time. He has been associated with the Firestone organization for 12 years, having been responsible for production since 1911.

S. P. Shelburne of Enid, Okla., manager of the Shelburne Motor Co., announces the opening of a sales room and service department at 1017-1019 North Broadway, Oklahoma City, for the exclusive distribution of the Dodge Brothers motor cars. Associated with Mr. Shelburne will be Eugene Dwelle as assistant manager; George Fuller, in charge of the service department, both of Enid, and F. M. Lee of Muskogee, in charge of the parts department.

F. H. Howell is the head of the F. H. Howell Sales Co., 1200 Bedford avenue, Brooklyn, N. Y., which has just been appointed distributor by the Plunkett Shock Absorber Co., 323 Washington street, Brooklyn, for the Brooklyn and Long Island territory.

A. E. Guertin and P. E. de Rochmont, who have for some time successfully handled the sales of Biddle cars in the Boston territory, have leased a large portion of the new fireproof building at 740 Commonwealth avenue, where they will maintain a first class service station. The sales department will remain at the Boylston street location and will be in charge of William Crapeau as director of sales.

William L. Edmond has resigned as cashier of the First State Bank & Trust Co., Waco, Tex., to become a member of the firm of Edmond-Penland Motor Co., 217 Washington avenue, which is engaged in the automobile business, having been appointed distributor for the Cleveland car.

E. M. Hottenstein, Lebanon, Pa., distributor of the Chevrolet Motors Co. for 11 counties in central Pennsylvania, has bought the Ensminger planing mill property at Harrisburg, Pa., which will increase the distribution facilities in that section of farm tractors and other products of the General Motors Corporation.

Garth A. Dodge, formerly connected with the Austin company at its Cleveland headquarters, has joined the Black & Decker Co., Towson Heights, Baltimore, Md., as branch manager for the states of Ohio and Indiana, and will also be in charge of the Cleveland branch.

Charles S. Osterman is the manager of the Sweeten Used Car Clearing House, Philadelphia, which was established by James Sweeten, Jr., local dealer in Franklin cars, and specializes in used cars of high grade.

Walter S. Sawyer, 36 Chestnut street, Malden, Mass., a salesman for the Kissel Kar Co., dropped dead at the show rooms of the company, 1250 Boylston street. Mr. Sawyer was 55 years old, was a native of Portland, Me., but had lived practically all his life in Boston and vicinity. Before becoming affiliated with the Kissel Kar Co. he was a salesman for the Packard Motor Car Co. and was at one time a salesman for the National Cash Register Co. He is survived by a wife and one son.

R. A. Robinson has purchased the interests of his partner, G. M. Starnes, in the Starnes-Robinson Auto Co., 115 Maple street, North Little Rock, Ark., and the concern will now be known as the R. A. Robinson Auto Co. The company operates a garage and service station.

PRESIDENTS OF FIRESTONE CO.

L. G. Fairbank, Vice President and Manager, Firestone Steel Products Co., Subsidiary of Firestone Rubber Co.

Mr. Fairbank became eastern sales manager three years ago, after three years in the advertising department, during the latter two of which he was assistant advertising manager.

A. G. Partridge, Vice President, Firestone Tire & Rubber Co., in Charge of Sales.

Mr. Partridge, who becomes vice president in charge of sales, came to the company in its infancy, growing up to be general sales manager, which position he has held for some time.

Harry V. Taylor of Dover, Del., is the manager of the new accessory store to be opened this month at Wilmington, Del., by the Taylor Auto Supply Co., 11th and Orange streets. Mr. Taylor is a graduate of Delaware college. During the war he was commissioned as a first lieutenant and was stationed at Camp Lee, Va. For eight months following his discharge he was with the Scranton Auto Supply Co., Scranton, Pa.

Major Pemberton Frame has recovered from the effects of being badly gassed while serving in the American army in France and has formed a copartnership with J. P. Keil to engage in the automobile tire business at 220 Olney road, Norfolk, Va., under the firm name of Keil-Frame Co.

W. O. Crabtree, president and general manager of the Graham Brothers Sales Co., distributor for New York City of Bethlehem trucks, has purchased for his company the building on West 57th street, just off Broadway, in that city, 100 by 125 feet, five stories in height. The price paid is said to have been approximately $300,000. This will supply the Graham Brothers Co. with needed larger quarters.

William M. Turnbull is treasurer and manager of the Colonial Auto Co., which is to erect a garage on the east side of Washington street, Hartford, Conn.

James J. Murphy has purchased the storage battery business formerly conducted by Earl Hotchkiss in the McNally garage, Whiting street, Plainville, Conn.

Woman Sells Cars at Baltimore

Miss F. Frances Maguire is one of the successful members of the sales force of the Schall-Crouch Auto Co., 116-118 West Mount Royal avenue, Baltimore, Md., distributor of Paige passenger cars and trucks and Atterbury trucks. Miss Maguire made her first attempt at selling motor cars in her home city, Philadelphia, in 1917, and has continued in the business ever since. She moved to Baltimore five months ago.

George W. Slocum is president of the Slocum Motors Co., which has just been formed to distribute the Mitchell and Chalmers cars in seven counties of Pennsylvania. The company has leased the building on North Washington street, Scranton, Pa., and will occupy the entire structure consisting of three floors. Associated with Mr. Slocum will be Arthur L. Weeks and Arthur Ellis, manager of the Lackawanna Automobile Co.. A three-year lease has been taken by the company.

R. H. Dauterich, formerly the first assistant superintendent of the three-inch gun shop of the Poole Engineering Co., Baltimore, Md., and for 20 years well known in the mechanical field in that city, has formed a company for general machinery and automobile work, to be known as the Crescent Engineering Co., with offices and works at 402-404 West Conway street, Baltimore.

Edgar F. Power, for 30 years a salesman for Chase & Sanborn, has become associated with the Packard Auto Exchange Co., which has leased the building at 33 Brookline avenue, opposite Fenway Park, Boston. Mr. Power is a director of the Metropolitan Trust Co. Howard S. Power, a brother, formerly with the Packard Motor Car Co., has also been admitted to the firm, and will act as general manager.

Frank K. Stehle is president of the Keystone Automobile Sales Corporation, Philadelphia, which has taken over the distribution of the King Eight car, made by the King Motor Car Co., Detroit. Mr. Stehle has long been associated with the automobile business and was also president of the Bearings Co. of Pennsylvania. He maintains a large and well equipped service department at 2120 Fairmount avenue.

Earl E. Beveridge, who was formerly connected with the Westinghouse Electric & Manufacturing Co., Pittsburgh, Pa., has been appointed works manager for the Federal Corporation, Westfield, Mass.. manufacturers of Liberty and Jumbo spark plugs and Syco products.

William R. Mample, superintendent of the Aluminum Castings Co., Fairfield, Conn., has accepted a position as foundry foreman at the Wright-Martin plant, New Brunswick, N. J., now operated by the International Motor Co.

George E. Blakeslee, 2561 Hudson boulevard, Jersey City, N. J., a pioneer dealer in automobiles, and a leader in the Good Road movement, died Jan. 10, aged 46 years.

Notes of the Industry and Trade

Friend Forms New Corporation

Otis C. Friend, one of the best known personalities in the automobile industry, announces the organization of the Friend Motors Corporation, with factories at Pontiac, Mich. Mr. Friend and his associates have purchased the plant and equipment of the Olympian Motors Co. and will continue to make the Olympian car pending the development of a new model which will embody Mr. Friend's ideals. Mr. Friend recently resigned as an executive of the General Motors Corporation. He has had a unique career as designer, engineer, production manager, sales executive and president, holding the latter position with the Mitchell Motors Co.

BRUNNER CO. OPENS NEW OFFICE.

The Brunner Manufacturing Co. Utica, N. Y., maker of garage air compressors, has opened a branch office in Kansas City, Mo., with H. S. Atherton in charge as district manager. This new office will provide for more intimate contact with the trade in the central territory west of the Mississippi.

The Cincinnati branch has also been enlarged recently to afford better cooperation to its rapidly increasing trade in the central, north central and south central states.

The Brunner products include a complete line of belt and motor driven air compressors for every purpose, high-pressure air tanks and fittings and complete compressed air equipment for garages. It has recently issued a new catalogue, which may be had for the asking.

JORDAN MOTOR CAR CO.

The Jordan Motor Car Co., Cleveland, O., is occupying its new plant, which has increased its capacity to three times its original space. It includes a new power plant, japanning building, a motor test building, a new assembly room and two-story warehouse.

In addition to this the Jordan company has annexed the property of the Metal Parts Manufacturing Co., which adjoins, and the incorporation of this building as a part of the Jordan plant will make possible an increase of more than 30,000 feet of floor space.

Otis C. Friend, President, Friend Motors Corporation.

ANNUAL MEETING DART TRUCK.

At the annual meeting of the Dart Truck & Tractor Corporation, held at its offices at Waterloo, Ia., Jan. 13, the following officials were elected: Directors, C. C. Wolf, W. H. Johnson, M. D. Herron, E. L. Stover, S. Y. Eggert; president, C. C. Wolf; vice presidents, W. H. Johnson and M. D. Herron; secretary and treasurer, E. L. Stover.

U. S. STEEL GETS FORD ORDER.

It is reported that the lion's share of the $15,000,000 steel contract just placed by the Ford Motor Co., Detroit, has been awarded to the United States Steel Corporation. It will be about 216,000 tons.

Trailmobile Co. Builds New Plant

The Trailmobile Co., Cincinnati, O., is just completing a large, modern factory at Oakley, a suburb of that city, which will be used for the production on a large scale of trailers of a wide variety of types. It is claimed that this will be the largest in the world engaged exclusively in the making of trailers for motor vehicles and has been planned so that extensions can be made rapidly to meet the further increasing demands of the business.

The past year has been a big one in every way for the trailer business, and especially for the Trailmobile Co. Thousands of truck owners, educated in the economies of trailer hauling by the use to which they were put by all the leading armies in the world war, have turned to it for commercial use.

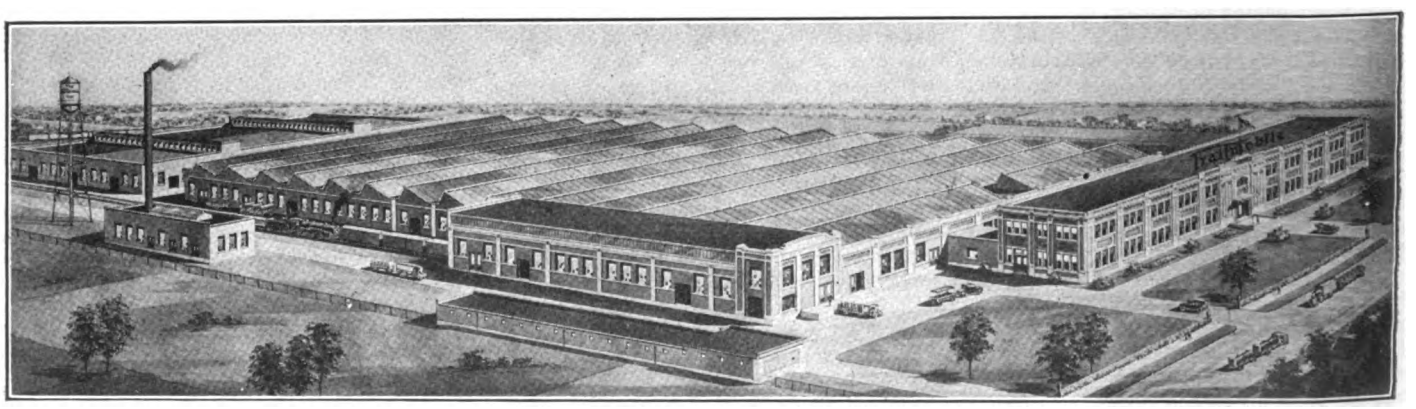
Great corporations, with vast amounts of hauling to do in the cities, have taken up the semi-trailer. Fleets of 150 units or more are now in operation. Statistics in states that require registration indicate increases of as much as 170 per cent. in the use of trailers during the past year.

Since the close of the war, during which it supplied in the neighborhood of 10,000 Trailmobiles to the government, the commercial business of the Trailmobile Co. has been greatly on the increase.

NEW BUILDING FOR G. PIEL & SONS.

G. Piel & Sons, manufacturer of automobile accessories, Long Island City, N. Y., has leased for a term of years a new manufacturing building, just completed by the Steinway Building Co., at Jackson and Steinway avenues, Long Island City.

The Piel company has also filed plans for the erection of a six-story and basement building, 150 by 200 feet, to occupy the block in Long Island City bounded by Seventh, Washington, Eighth and Pierce avenues. It is designed for a modern fire resistant, industrial structure, to be built of reinforced concrete with brick spangel walls and steel sash.



The New Plant of the Trailmobile Co. at Oakley, a Suburb of Cincinnati, O., Which Is to Be Used Exclusively for the Production of Semi-Trailer and Trailer Units, Claimed to Be the Largest Factory of the Kind in the World.

Rawson-Upshaw Co. Formed

A new firm, the Rawson-Upshaw Co., opened for business on Jan. 1 at 310-314 Marietta street, Atlanta, Ga., for engaging in an exclusively wholesale business in automotive equipment, bicycles and supplies. The president of the new concern is William A. Rawson, who has been connected with the Elyea company of Atlanta for the past four years as active head of the bicycle department.

E. N. Upshaw, Vice President and Treasurer, Rawson-Upshaw Co.

E. N. Upshaw, who is vice president and treasurer, has been associated with the Elyea company since the early part of 1910. He started his business career in 1902 in a wholesale hardware house in Birmingham, Ala. His first connection with the Elyea-Austell company was as a traveling salesman, and he was later made department manager. At the time of his joining the Rawson-Upshaw company he was sales manager and secretary of the corporation.

The Rawson-Upshaw company will operate along well recognized jobbing lines and as they have ample capital and are well known and popular in the section in which they are to be represented, a successful future may be predicted.

GILL PISTON RINGS.

On account of the large amount of reboring and regrinding of scored cylinders which is called for today, a tremendous demand has developed for over-size piston rings. The Gill Manufacturing Co., 351 West 59th street, Chicago, is specializing in over-size rings for this class of work and makes no extra charge. The Gill piston rings are made to fit practically all motors in sizes ranging from two inches to 12 inches. The over-size rings can be obtained through jobbing and accessory houses throughout the United States.

Gasoline is 75 cents a gallon in Buenos Aires.

BUDD COMPANY INCREASES STOCK BY $2,000,000.

Stockholders of the Edward G. Budd Manufacturing Co., Philadelphia, maker of all-steel automobile bodies, have approved an increase of $2,000,000 in the eight per cent. preferred stock of the company, bringing the total amount of authorized stock up to $4,251,700.

The net earnings of this company for 1919, November and December (estimated), are $1,275,470, compared with $1,014,104 for 1918.

During the war the Budd company turned out large quantities of truck bodies for the government, which adopted its model as a standard, and at the time of the armistice it was running 100 per cent. on government work. A few months later the entire plant was switched on to a peace basis again, but unfilled orders on the books now amount to more than $15,000,000. Of the preferred stock just authorized the proceeds of $1,000,000 worth will be used for the erection of an addition to its plant.

JACKSON'S 1920 PROGRAMME.

The Jackson Motors Corporation, Jackson, Mich., plans to turn out 3000 of the new series of Jackson Six cars by July 1, as well as several hundred of the 3½-ton four-wheel-drive trucks.

E. M. Benedict, formerly of the Hayes Wheel Co., is the new works manager of the Jackson Co., and the new advertising manager is Guy C. Core, formerly of the Briscoe Motor Corporation.

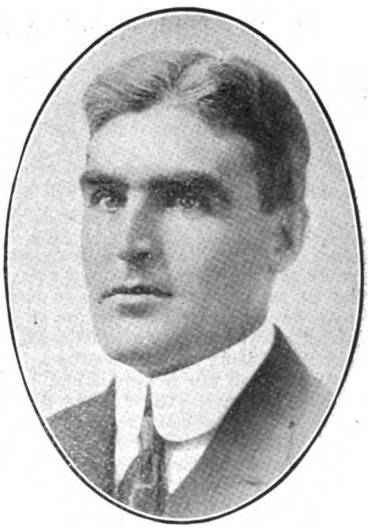
BLACK & DECKER AT CLEVELAND.

The Black & Decker Manufacturing Co., Towson Heights, Baltimore, Md., has extended its permanent organization by the establishment of a branch office at 6523 Euclid avenue, Cleveland, O., in charge of Garth A. Dodge, formerly connected with the Austin Co. at Cleveland, and who recently became branch manager of Black & Decker for the states of Ohio and Indiana.

William A. Rawson, President, Rawson-Upshaw Co., Atlanta, Ga.

Essex to Double Production

Essex Motors, Detroit, has just shipped the 20,000th Essex car from the factory, this event marking the completion of the Essex production programme scheduled for 1919. Less than a year ago the lines on which these cars were to be assembled existed only on paper, although the design of the car itself had been perfected and submitted to every conceivable test for more than a year, when production plans were brought to a standstill by war conditions.



W. J. McAneeny, President, Essex Motors.

When the armistice was signed new equipment had to be purchased and installed and material collected before manufacture could begin. Nevertheless the Essex was in production in December of last year and early in January cars were being shipped to distributors and dealers. Since then the demand has taxed production to the utmost and as a result it is planned to double the number of cars to be made next year, or to turn out 40,000 cars.

The president of Essex Motors is W. J. McAneeny.

FRANKLIN CO. BREAKS RECORDS.

The H. H. Franklin Manufacturing Co., Syracuse, N. Y., reports that 1919, the transitional year between war and peace, broke all production records at the Syracuse factory, 9173 cars being shipped. The best previous year was 1917, when the total number of cars shipped was 8987.

It is reported that on Jan. 1 the Franklin Co. had 3000 unfulfilled contracts on its books, despite the fact that the factory is employing the largest number of workmen in its history, almost 5000, and is running to capacity. Fifty cars are being turned out daily, and this number will shortly be increased to meet the 1920 schedule, which calls for 18,000 cars.

The New Plant of the Timken Roller Bearing Co. at Columbus, O., Now Nearing Completion. At Left, the Front of the Main Building, 500 by 300 Feet; at Right, the End of the Structure for the Heat Treating Department at the Rear.

Timken-Detroit Axle Co. Making Plans for Extensive Expansion

TIMKEN-DETROIT Axle Co., Detroit, is making plans for expansion on a larger scale this year to provide for an increase of at least 50 per cent. in its output in 1921, and to insure this it has been decided that the company will produce in its own factories still more of the important materials which enter into its product, and thus also reduce costs and promote efficiency. It has been the fixed policy of the Timken company to have at least two sources of supply for all of its important requirements, in most cases one of these being its own factories, the exceptions being raw materials and Timken roller bearings. The Timken Roller Bearing Co. is now operating two separate and distinct factories to provide insurance against accident at either one of the factories.

The Timken-Detroit Axle Co. operates its own malleable foundry, steel foundry, forge plant and gear plants, both bevel and worm. This company was organized in 1909 for the purpose of taking over the axle business of the Timken Roller Bearing Axle Co., which was organized in St. Louis over 20 years ago, beginning with manufacture of roller bearings and axles for horse drawn vehicles, later moving to Canton, O., and engaging in the manufacture of axles for automobiles as well as Timken roller bearings.

This business has now grown to a point where the Timken-Detroit Axle Co. furnishes over 120 customers with axles for passenger cars and trucks, the schedule for 1920 being 255,000 sets. The plans, as outlined now, will provide for 400,000 sets in 1921. This increase is necessary in order that the demands of customers may be supplied.

It has been the practise of the company to put back into the business each year about 75% of its earnings, so that the invested capital today is approximately $18,000,000, represented by the present outstanding $3,000,000 of common stock and $5,000,000 of preferred. It is planned to pay cash dividends on the invested capital at the rate of approximately six per cent. during 1920. Of the capital authorized $5,000,000 of the preferred has already been sold and over $2,000,000 of the cash has been invested in plants and equipment.

The principal unit is constructed of structural steel and is a saw-tooth type with seven bays, each about 43 feet wide, and when completed it is maintained that it will be one of the largest, best ventilated, best lighted and best coordinated plants of the country. The main building will be without partitions.

In addition to the main building there is a structure 340 by 60 feet in which will be the heat treating department, which will be equipped with every facility and will be adequate for a very large volume of production.

A meeting was held in Canton O., Jan. 5, at which a board of directors, as follows, was elected: H. H. Timken, chairman; W. R. Timken, A. R. Demory, H. W. Alden, Fred Glover, Heman Ely and Austin Lynch. They in turn elected the following officers: President, A. R. Demory; vice president, H. W. Alden; vice president and general manager, Fred Glover; vice president and secretary, C. W. Dickerson; treasurer and assistant secretary, C. G. Rowlette; sales manager, P. W. Hood; director of purchases, F. H. Maisonville.

AUTOMOTIVE INDUSTRY BOOM IN MILWAUKEE.

The W. S. Seaman Co., Milwaukee, Wis., manufacturer of automobile parts, has acquired 15 acres of land on the North side in that city, where it proposes to erect a plant, the cost of which may ultimately reach $8,000,000.

With the A. O. Smith corporation erecting a $3,000,000 plant for the making of automobile parts, the Nash company building a factory to cost several million dollars for making automobiles, and the Ogren Motorcar Co. also constructing a plant, Milwaukee is experiencing a boom in the automotive field.

SAVAGE ARMS MAKES AXLES.

The Savage Arms Corporation, Sharon, which during and prior to the war manufactured many three-inch rapid fire guns for the United States navy, will soon complete its contract and the last of these guns is now being turned out. Preparations are being made at the plant for the extensive manufacture of motor truck axles and roller bearings. The works are now operating to capacity and it is said there are many orders ahead for automobile parts.

TIRE COMPANIES CHANGE NAMES.

The Akron Tire Co., New York City, has changed its name to Akron Overland Tire Co. and has increased its capital from $10,000.000 to $10,700,000.

The Rochester Tire & Rubber Co., Buffalo, N. Y., has changed its name to the Powerton Tire Corporation.

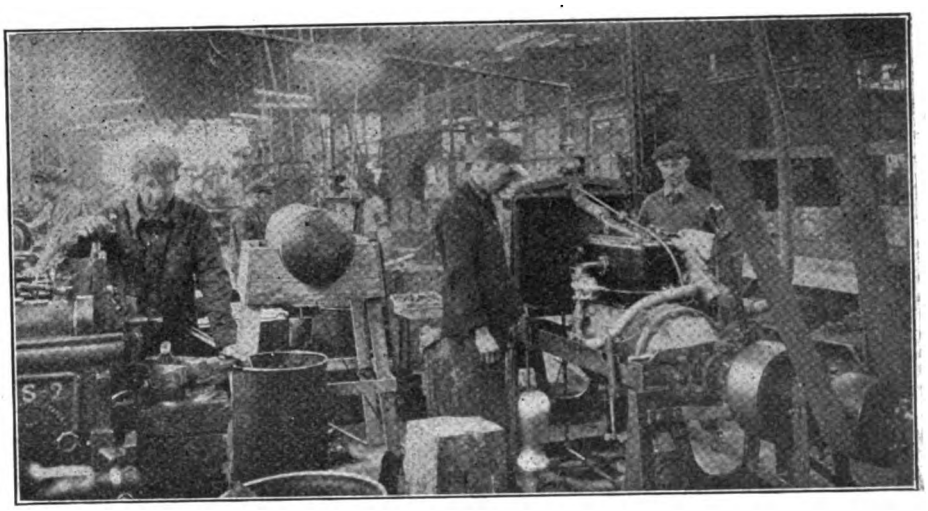
$10,500,000 for New Buick Plants

At the annual meeting of the Buick Motor Co., Flint, Mich., Jan. 19, plans were announced for the erection of new factory buildings and extensions to the plant at Flint to cost approximately $7,500,000, and an additional $3,000,000 for a building and assembling plant at St. Louis where, in addition to assembling 200 cars a day, equipment for turning out 200 finished bodies a day will be installed. The programme includes the construction of nine new buildings and extensions to others with new machinery and equipment, with a view to increasing the total daily production to 750 finished cars.

The directors elected H. H. Bassett president and general manager to succeed Walter P. Chrysler, resigned.



Buda Engine Temporarily Installed to Supply Power at Service Motor Truck Co.'s Plant, Wabash, Ind., During Coal Shortage.

RAUCH & LANG TO BUILD AT CHICOPEE FALLS.

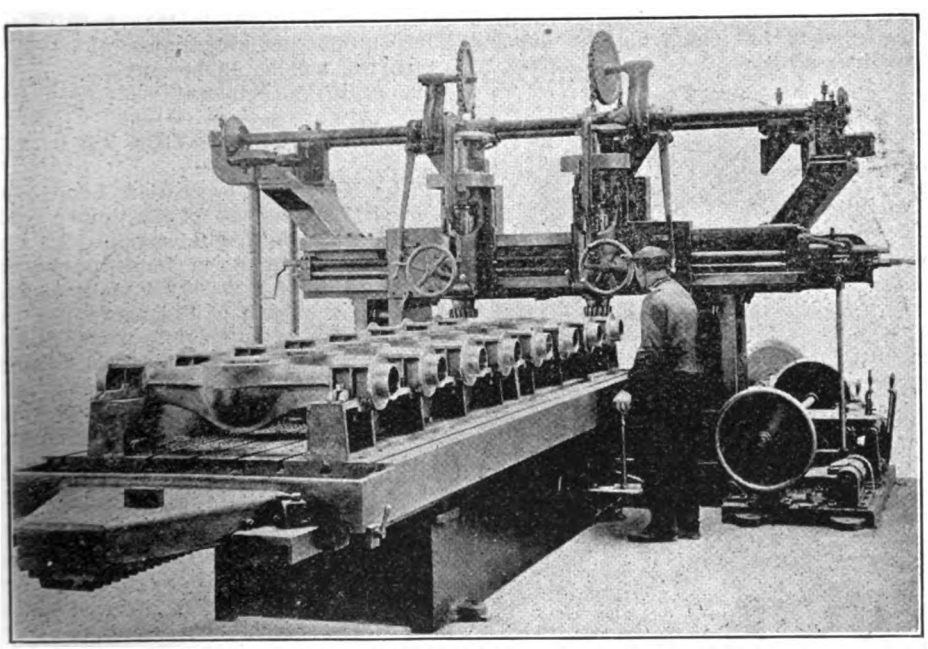
Rauch & Lang, Inc., which has taken over the R. & L. electric interests, has decided to build a factory on the plot of land recently purchased at Chicopee Falls, Mass. No complete personnel of the new organization has yet been announced, but it is understood that men closely identified with Rauch & Lang in the past will head the new concern. The vice president and general sales manager is Harry H. Doering, one of the pioneer electric car men of the country, formerly sales manager of the Ohio Electric Car Co., and for the past seven years with the Rauch & Lang organization as sales manager and in other executive capacities.

The new plant will adjoin the new Stevens-Duryea plant at Chicopee Falls, and will be but a short distance from the new Rolls-Royce works.

NEW RAYFIELD CARBURETOR.

The Beneke & Kropf Manufacturing Co., Chicago, manufacturer of the Rayfield carburetor, is presenting a new type of carburetor for Ford cars, which is the result of experimental work on the part of Rayfield engineers covering a period of three years. The construction is of the venturi type, with accelerating well and multiple jet nozzles, and is said to cover the essentials of easy starting, ample power and acceleration, together with minimum fuel consumption. The important features are its simplicity of construction, the elimination of all moving parts and thermostatic air control. This last mentioned device is patented and is stated to be featured only in the Rayfield; it provides for the operation of the carburetor at the same degree of temperature during all seasons of the year, so that it is not necessary to readjust it for changes in the weather.

The new carburetor is sold complete with all fittings and is designed to replace the regular Ford equipment. An adjustment for control from the dash is provided along with the hot air jacket, tubing, manifold gaskets and cap screws. Price, $18 complete.



Bemmn & Smith Planer with Four Milling Heads, with Which Four Operations Are Made on Eight Axle Housings at One Time in the Plant of the Wisconsin Parts Co., Oshkosh, Wis.

WESTINGHOUSE APPOINTMENTS.

The Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa., has announced the following appointments:

At East Pittsburgh—Alexander Taylor, for many years manager of works, to be assistant to vice president in general charge, in all plants, of production, stocks and stores; R. L. Wilson, promoted from general superintendent to works manager; E. R. Norris, director of works equipment, in charge of machinery, tools and methods in the various plants; C. B. Auel is made manager of the employees' service department.

G. M. Eaton has been made chief mechanical engineer of the company; C. W. Johnson and H. W. Cope, assistant directors of engineering; C. H. Champlain and E. S. McClelland, assistant works manager; John E. Bonham, assistant to works manager; E. S. Brandt, supervisor of equipment and methods.

Managers of Engineering Departments—A. M. Dudley, automobile equipment; R. P. Jackson, material and process; F. E. Wynne, railway equipment department; G. H. Garcelon, Small motor.

STUDEBAKER'S PROPOSED OUTPUT.

The Studebaker Corporation, South Bend, Ind., according to President Erskine of the company, will produce approximately 80,000 cars during the current year, with net sales close to $150,000,000, as compared with an output of 38,380 in 1919, valued at $80,000,000. In other words, while 1919 was the best year in the company's history, the current year promises to better this record by a big margin.

It is estimated that the annual report will show a balance sufficient to pay about $20 a share on the $45,000,000 common stock outstanding.

The new plant at South Bend will be under production in a short time, when something like 12,000 additional workers will be required.

Automobile Body Builders Swamped with Business

AS A result of the enormous expansion in automobile production in the United States, the builders of motor car bodies are fairly swamped with business. Only a comparatively few of car manufacturers other than the Ford Motor Co., build their own bodies. An indication of this unprecedented demand for bodies which American builders have been called on to meet is shown when it is stated that the production of passenger cars increased from 926,388 in 1918 to 1,586,787 in 1919, and it is estimated that during the current year more than 2,000,000 more will be turned out. The number of trucks increased from 227,250 in 1918 to 305,142 in 1919, with an estimated output of 425,000 in 1920.

The Fisher Body Corporation, control of which was recently acquired by the General Motors Corporation, has 22 plants in Detroit, one in Canada and operates as a subsidiary the recently organized Fisher Body Ohio Co. with plants at Cleveland. The Ohio company is capitalized at $10,000,000 preferred stock and 20,000 shares no par value common stock. From funds derived from the sale of preferred stock $6,000,000 is being expended on plant and equipment. F. J. Fisher, president of the company, says the Cleveland plant will be the largest of its kind in the world and estimates that within two years the Ohio company alone will be doing a business of $25,000,000 a year. The Detroit company for the year ended April 30, 1919, returned net profits of $1,600,000 after all charges and federal taxes.

The Mullins Body Corporation.

The Mullins Body Corporation was incorporated last year to take over the business and assets of W. H. Mullins Co., Salem, O. In addition to automobile bodies this company turns out automobile parts and small steel boats. Of the authorized capitalization of $1,000,000 preferred stock and 70,000 shares of no par value common stock, all the preferred and 30,000 shares of common were sold at the time the new company was organized. Within four months so much new business was acquired, mainly for automobile bodies, that the remaining 40,000 shares of common stock were sold to secure additional working capital. Net earnings are running at the rate of $72,000 a month before taxes, and unfilled orders total approximately $600,000. On this basis net earnings for the current year will probably exceed $13 a share on the common stock before taxes.

C. R. Williams Body Co.

C. R. Williams Body Co., whose main plant is at Detroit, found its capacity of 500 bodies a day there insufficient to meet its requirements. Consequently it purchased a large tract of land at Bay City, Mich., on which it has erected milling, wood working and dry storage plants, and the Detroit plant is now used for metal work, assembly and delivery. No figures on last year's business have been made public, but it is known that 1919 sales were greatly in excess of the $5,675,000 sales reported for 1918.

The Rubay Co.

The Rubay Co. of Cleveland, an offspring of the original Leon Rubay concern of France, was recently incorporated in Delaware with a capitalization of $1,000,000 preferred stock and 30,000 shares of no par value common stock. With $850,000 derived from the sale of part of the preferred stock extensive plant extensions are being made. It is estimated that the company has unfilled orders on its books of approximately $4,500,000,000.

Lang Body Co.

Lang Body Co. of Cleveland is trebling its capacity through the addition of plants now nearing completion, which will be paid for from the proceeds of the sale of $1,000,000 new preferred stock. When the new buildings are finished the Lang company will be able to handle from $4,000,000 to $5,000,000 worth of business a year.

Superior Body Co.

Superior Body Co., Rahway, N. J., has been capitalized at $500,000, all common stock of $5 par value, to take over an old copartnership of the same name. The company is completing the construction of additional plants which are required to help fill the $8,000,000 worth of orders now on hand.

Other Body Plants.

There are a number of other automobile body builders in the United States of whose activities no details have been given out except the fact that they are all planning increased production and plant extensions. It is the consensus in the automobile industry that the shortage of motor cars cannot be met in less than a year. With every automobile maker working on schedules of from 25 to 100 per cent. increased output this year, the builders of bodies will have their hands full supplying the demand for their product.

J. W. DeCou, Vice President and General Manager, Fairfield Manufacturing Co.

FAIRFIELD MANUFACTURING CO.

Announcement has just been made of the organization of the Fairfield Manufacturing Co., Lafayette, Ind., to manufacture differential and bevel gears for automobiles. The officers, all of whom are prominent in the Ross Gear & Tool Co., maker of Ross steering gears, are as follows:

President, D. L. Ross; vice president and general manager, J. W. DeCou; secretary, Edward A. Ross; treasurer, George C. Kumming; consulting engineer, David E. Ross.

The organization of the Fairfield Manufacturing Co. is the outgrowth of the increase in the business of the Ross Gear & Tool Co. A part of the factory of the latter concern has been devoted to the making of differential gears that will now be produced by the new organization, and the Ross plant will be devoted entirely to the production of steering gears.

All of the patents, machinery, etc., for making bevel gears, formerly owned and controlled by the Ross Gear & Tool Co., have been taken over by the Fairfield Manufacturing Co., which has taken possession of the plant formerly occupied by the Lafayette Engineering Co. and will immediately put it under full production.

BRISCOE CONTROLS BODY PLANT.

The Briscoe Motor Co., Jackson, Mich., has acquired the plant of the John Bohnet Co., Lansing, Mich. The Bohnet company has been one of the largest manufacturers of closed automobile bodies in the country and in taking it over the Briscoe company will have every facility for building all the bodies for the Briscoe closed models. The Briscoe company will make improvements and additions to this plant to take care of the 1920 production programme which, it is reported, will be double any year in the history of the company.

KENNEDY CORPORATION TO BUILD.

The Kennedy Corporation, headed by Joseph P. Kennedy of Baltimore, Md., and financed by capital supplied in that city, is to commence immediately the construction of a $2,000,000 plant at Curtis Bay, a suburb of Baltimore, for the manufacture of automobile parts, this to be the first unit in a $4,000,000 factory, the second to be built before the year is ended. Each unit will employ 1200 workers. The buildings will be of steel and concrete and modern in every respect.

DUFF JACK SALES CO.

The Duff Jack Sales Co., Ltd., has been formed, with headquarters in the Oxford Circus House, 245 Oxford street, London, W. I., England, to represent the Duff Manufacturing Co. of Pittsburgh, Pa., in the British Isles, and has been given the exclusive agency in this territory for Duff and Barrett jacks.

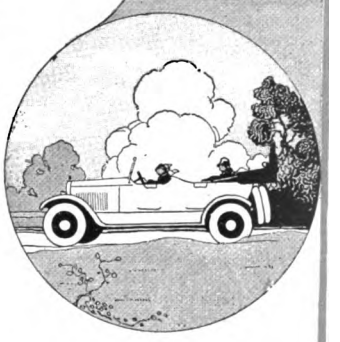
Profit for the dealer

STERLING TIRES have met extreme conditions in many lands. Stand on any public highway in this country—or in foreign countries, and you will see them roll by, each one making a satisfied customer for the dealer who sold it.

A satisfied customer is usually a permanent customer. That is what you want and that is precisely what you will get, when you sell Sterling Tires!



One of the Oldest

THE "Sterling" is one of the oldest tires on the market—although the tire industry as a whole, is comparatively new.

For thirteen years now, we have been building tires of the best materials obtainable—and in accordance with the most scientific principles; we have carefully weighed every opportunity for improvement. Sterling Tires have always been sturdy, but today, they have greater endurance than ever.

We want wholesale distributors and retail dealers to write for full information.

Comprehensive Business Record for Accessory Dealer

By Walter Engard.

IN THESE days of rising costs and narrow margin of profits, no retail dealer in any line can hope to operate his business successfully without some system of accurate records that will bring to his attention every day all the important facts and figures summarized in such form as to keep him in constant touch with every detail that may aid him in directing it along the most profitable channels. This is as applicable to the dealer in automobile accessories and supplies as to any of the other branches of merchandising.

Most every dealer has some method of keeping an accurate record of all money received and paid out and just what it is paid for, but this is about as far as their records go in many cases. This condition carries with it various undesirable results. In the first place the dealer is unable to determine just what progress his business is making in the way of profit. Profit is the most important element in any business. It is for this one phase that business exists, yet a large majority of retail merchants are content to wait until the inventory period in order to determine whether or not the business has turned them a profit.

Many accessory and supply stores find that after the annual inventory has been footed up the net profits usually fall far short of what they have a right to expect in view of the volume of business done during the year. Profits are the reward of management—the more efficient the management the larger the profits and large sales do not necessarily mean large profits.

In the second place, without accurate records the dealer is unable to determine where the leak is that has caused his profits to fall so far short of what he had expected, and he continues to operate his business year after year under these same conditions because his records do not show him what he can do to better the situation. The result has been that a large number of merchants have been operating their businesses with little or no profit.

Value of Records.

An adequate system of records affords the dealer an accurate means for promptly correcting errors or extravagances in policies and methods, for checking the accumulation of otherwise inevitable losses, and to quickly develop plans which will result profitably. They show him where he may be liberal and where he must run close. If he has his business divided into departments these records will visualize the progress of each department. They will demonstrate what operations are being carried on at a profit and at what margin, so that it may be known which lines are profitable and those lines retained and the less profitable ones discarded.

The retail dealer's system of records should be simple and the detail work necessary to keep them should be reduced as much as possible. But there is such a thing as making them too simple, so simple in fact that what is saved in time is lost in knowledge of the business. This system of records should be more than a mere jumble of figures. Occasionally a merchant will have his figures in such a shape that although theoretically he has every important item in front of him, yet when he is called upon to segregate them so that it will be possible for him to make out a financial statement or a trade report, he is unable to do so. The data should be in such form that he can analyze his business transactions during a certain period and is able to furnish his banker or creditor with a true report of his financial condition in short order.

Requires Only One Form.

The system of store records here described is one that will give the auto or accessory dealer a thorough knowledge of every important detail of his business in the least amount of space and with the least effort. It is composed of but one simple form, yet is complete and will give a true insight into the progress of business and its true financial condition.

The whole thought in devising it is to make it a guide to better retailing instead of a mere matter of record keeping. All the necessary details are cared for in such a simple way that the owner will know every morning exactly how he stands, and no merchant can direct his business properly without having just such facts constantly available. Accurate records are not based upon any element of guess work. Good management is not a matter of guess work and you don't use good judgment when you guess.

To start this system properly the very first thing necessary for the dealer to do is to take a physical inventory of all stock on hand. This is the only way in which he can be sure that the future information shown by the records is to be accurate. The taking of the inventory cannot be too exact and the merchant should impress upon all who may participate in this operation the importance of counting and entering every article correctly.

Necessity of Departmentizing.

If you do not already have your stock departmentized I would advise that the first thing to do is to divide it into departments, especially if conducted on an extensive scale. While this is not absolutely necessary in order to use this system of records, yet the information secured will be much more complete and of infinitely greater value to the dealer.

For instance, here is one phase of this record in which he will find the separate reports of each department of great value to him. This record provides for keeping a perpetual valued stock record of goods on hand and if the store is not departmentized, of course this record will only show the value of the total stock, whereas if the store is thoroughly departmentized and a record of each department is kept the merchant will know the condition of his stock in each and will find this knowledge of great aid to him

RECORD OF BUSINESS

Department _____ Month _____ 19____

Date	Am't of Sales	Cost of Sales	Gross Profit	Am't of Purchases	Operating Expenses: Rent	Salary	Adv	Delivery	Display	Heat & Light	Drayage Freight Express	Taxes Ins Interest	Wrapping	Depreciation	Misc	Total

Total	$_____	Net Profit	$_____	
Cost of Goods Sold	$_____	Percent of Net Profit	_____%	
Balance Stock on Hand	$_____			

Digitized by Google

in its operation. There are many other features in this system which will prove of double value to the dealer if acquired for each department separately. Thus if the stock is departmentized the inventory should be taken by departments and each kept separate.

As soon as the inventory is completed the inventory sheets for each department should be totaled and the total amount of stock in each department found and then turning to the "Record of Business" form it will be noted that it provides for the records of one department only, so if the stock is divided into various departments one form must be used for each department, otherwise a single form will be used for the records of the business as a whole.

In describing the working of this system I am proceeding on the theory that all who use it are to departmentize their stock, as this is a step in the right direction towards progressive merchandising. So we will take one form for each department and enter upon it the name of the department and the month for which the records are to be kept.

It will be noted that this form provides for the records for one month only and that a new form must be used for each new month.

After filling in this information it will be noticed that down in the left hand corner of this form space has been provided for the keeping of the perpetual value inventory. Here we will enter the amount of stock on hand in each department as shown by the inventory sheets, using the line marked "Stock on Hand First of Month." As soon as this has been completed for all departments the system is ready for use.

Sales Slip Method.

In presenting this system, or, in fact, any system, it is necessary that it be thoroughly understood that the sales slips method for making a record of every transaction should be adopted. This is very important in the working of this system.

Next the dealer should see to it that every article of merchandise is marked with a price ticket upon which is entered the cost mark and the selling price. This, too, is very essential in the working of this system. Therefore, in taking inventory every article should be marked and thereafter nothing should go into stock without first being ticketed. Now when a salesman makes a sale he will make out a sales slip of a form such as is in common use in retail establishments, providing space for entering the name of the article sold, the quantity, the cost mark as shown by the price ticket and the price received, also entering the name of the department from which the article is sold. In case the salesman makes sales to one customer from more than one department he will make out a separate sales slip for each department, entering the name of the department. This will facilitate the work of the cashier or bookkeeper and will not cause the salesman any great inconvenience. The sales slips should immediately go into the cashier following the sale. The cashier should have a sheet of paper on the desk handy upon which to enter all sales as they come into the desk. This sheet of paper should be so ruled as to provide for the entering of the sales for each department separately, keeping the amount of the sale in one column and the cost of the goods sold in another.

In case of any returned goods the amount of the sale and also the cost should be recorded and deducted from the totals at the end of the day.

Daily Sales Totaled.

At the close of the day the cashier should total the sales for each department, also the cost of the goods sold, and then turning to the "Record of Business" form for each department she should enter these figures under the headings "Sales" and "Cost of Sales" as provided on this form. Subtracting the cost of the goods sold from the total of the day's sales will give the amount of gross profit on the day's sales and this figure will be entered in the column headed "Gross Profit."

Under the heading of "Operating Expense" as provided on this form, space is afforded for keeping an accurate account of all operating expense under separate headings. This method enables the dealer to know how his various items of expenses run in the various departments. All expenses should be apportioned to the various departments according to their size and the volume of sales. Of course any expense incurred directly through the operation of that department should be charged exclusively to it and not apportioned to any of the other departments.

Such items as rent, office expenses, advertising, heat and light, insurance, taxes, salaries, including that of the proprietor, display, etc. should be properly apportioned. It will also be noted that on this form under the heading "Operating Expenses," there is a column for charging off depreciation. The owner should determine at the beginning of the year the amount of depreciation that is to be borne by each department during the year and he should charge off 1/12 of this each month.

As this blank only provides for these records for one month, a column has been provided at the extreme left hand side in which to enter the date for which the figures are entered.

Total Monthly Record.

At the close of the month these various columns should be totaled as provided for by the form, giving the total volume of sales for each department during the month, also the cost of those sales, the amount of purchases and the amount of expenses. It will also be noted that this form provides for entering the expense ratio to sales. Here the dealer may see just what percentage each item of expense bears to the sales, also what percentage of the sales the total expense in that department requires. This will enable him to know that his mark-up percentage is sufficient to cover his cost of operating that department and to leave a fair margin of profit.

As soon as these various columns have been footed the perpetual valued inventory record should be completed as provided in the left hand lower corner of the form by entering the total amount of purchases for the month, using the line marked "Goods Purchased" and subtracting the cost of the goods sold from the total of the purchases plus the stock on hand at first of month, the balance stock on hand at the close of the month is obtained, also the amount of stock with which to begin business the following month, and this figure should be transferred from this form to the form for the new month.

Under the heading "Profit" on the bottom of the form next to the space provided for the perpetual inventory should be entered the amount of gross profit for the month, as shown by the column under the heading "Gross Profit," and also the total expense for the month, entering these figures on the lines as provided. Subtracting the expense from the gross profit gives the amount of actual net profit this department has turned during the month.

Record of Unusual Conditions.

Under the heading of "Remarks" space has been provided in which entry may be made as to the weather conditions, etc. As these records should be filed away for future reference, such notations should prove of value. For instance, during February, 1920, weather conditions may have been such that the department has fallen down in profits, and years to come when this record is referred to it may be wondered why it was that the profits were so small, and then in another year, when comparing the records for this same department for the month of February, 1921, a fair comparison cannot be drawn unless allowances are made for the weather conditions. Or a special sale may be held in one department that may cut the net profits; then this should be recorded so that comparisons may be made with accuracy.

This record enables the manager to know just what progress each department is making.

Comparison of Departments.

This record will also bring to light which department is sapping away the profits of the other departments in plenty of time for the manager to apply a remedy and establish that department upon a profitable basis or to discard it altogether. In short, this record brings before him every important fact and figure of the business that is essential for its successful management. With these records the dealer need not wait until the annual inventory is taken in order to determine whether or not the business is making money.

The accuracy of these records can be quickly proven by taking a physical inventory of any department at any time desired. With this system it is not necessary to take an inventory of the whole store at one time, but of any department when and as often as desired. Instead of inventory taking being a drudgery it should become a pleasure.

No Loop Holes for Trade Loss

There's only one limit to UNIVERSAL BATTERY business—and that is the total number of battery users in your trade territory. Every battery owner is a prospect—and a live one. The vast majority of them can be sold—and re-sold repeatedly. There is no sales loss—no profit leakage.

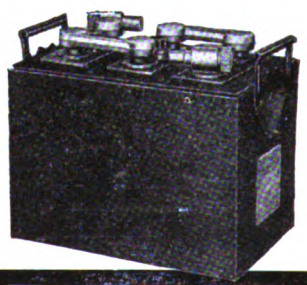
UNIVERSAL business is permanent business. In the first place, UNIVERSAL BATTERIES render the most efficient and economical service.

Thousands upon thousands of tests prove that absolutely. Motorists know the UNIVERSAL. They are familiar with its super-worth. This means prestige—it means patronage—it means ever-increasing profits through increased volume of business.

Next—and this is important—UNIVERSAL BATTERY parts can be employed on all standard makes of batteries. You can serve any battery user. You are not tied down to one particular brand. Your service is UNIVERSAL.

The UNIVERSAL Agency proposition is the most attractive you've ever seen—the most business like in every respect. The dealer who can meet our requirements is assured the biggest, best paying battery trade in his selling zone.

We also manufacture Universal Sealed Glass Cell Batteries for house lighting systems and parts for any make of sealed glass cell Batteries.



Particulars upon request to reliable persons already engaged in the sale of batteries or seriously considering going into the battery business.

UNIVERSAL BATTERY CO.

3420 S. LaSalle Street, Chicago, Ill.

Wetmore-Savage Co. Makes Phenomenal Growth

A YEAR ago was recorded the purchase of the Boston branch of the Motor Car Equipment Co., 180 Massachusetts avenue, by the Wetmore-Savage Co., electrical jobber, of 76 Pearl street, Boston.

This energetic and far sighted firm saw the possibilities of the coming years in the automotive equipment line, the advantage of an up-town location in the heart of the automobile district, and the opportunity for a high-grade jobbing house conducted for the New England trade, by New England men, with a broad-minded, aggressive and sound business policy along lines already established in the electrical line down town.

Its plans comprised the conservative building up of an able organization with knowledge of the line and the New England trade, the equipment of adequate quarters with all modern facilities for conducting an efficient jobbing business, and the establishment of business

E. W. Littlefield, Sales Department, Wetmore-Savage Co.

methods founded upon the element of service developed to the highest point possible.

It was expected that at least a year would have to be spent in preparatory work along these lines with volume a more than secondary consideration; but the season was scarcely in full swing before a phenomenal increase in business had rendered the original quarters inadequate and forced new construction to provide for increasing demands.

A second story over the old motor car building was completed in December, but by February still more space was demanded by the growing business and work is now started on further expansion which will eventually extend the Wetmore-Savage plant over an entire city block. This latter addition is to house the extensive Gould storage battery department, which will be moved to the up-town branch. This department is administered by M. F. Robbins, Jr., a storage battery expert, for 12 years connected with the sales and service organization of a prominent electrical manufacturer.

The entire New England territory is covered by a corps of 30 salesmen, of which the group traveling the territory outside of the local field is under the general direction of E. E. Warfield who for nine years was district salesman in Connecticut and Western Massachusetts

V. C. Bruce Wetmore, One of the Founders of Wetmore-Savage Co.

for the Motor Car Equipment Co., traveling both from the New York and Boston offices. Elmer W. Littlefield, for nine years prominent in the automotive equipment trade in Maine, and for three years in the sales end of the Wetmore-Savage automobile department at 76 Pearl street, has direct supervision of sales in the metropolitan district.

The office administration of sales and service is in charge of John C. Lane, who has served in the same capacity at

Hanson Savage, General Manager, Wetmore-Savage Co.

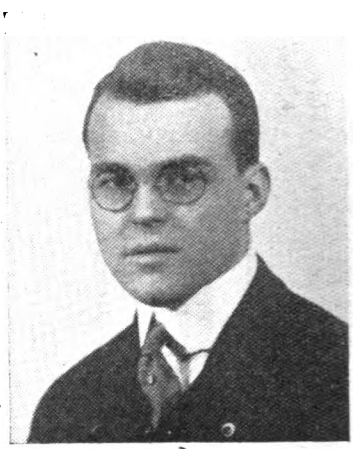
the down town office since the automobile department was started.

The purchasing department is in the hands of R. P. Greene, well known to the trade through his connection with the Motor Car Equipment Co. in the same position. Credits are handled by H. T. Watkins, formerly in the advertising department of the Motor Car Equipment Co. in New York and later connected with the sales and credit end of the same company in Boston.

The growth of the Wetmore-Savage company in the automotive equipment line has been rapid. but along sound, conservative lines. Swinging into the field as a practically new organization, it has emphasized the idea of service as a basis for its entire business fabric. This implies a complete and carefully selected stock of representative lines, carefully kept up to date, ample capital to insure facility of operation, efficiency of personnel and courteous attention at all times to individual wants of customers.

Service is the aim of the entire organization.

The Wetmore-Savage Co., under the



E. E. Warfield, Sales Department, Wetmore-Savage Co.

management of V. C. Bruce Wetmore and Hanson M. Savage, started in the electrical supplies business about 14 years ago in a modest way. Since then it has developed a business second to none in its line in New England. Mr. Savage is the general manager.

The Wetmore-Savage Co. does an exclusively wholesale business and among the well known lines for which it is the New England distributor are Gould storage batteries, Holophane lenses, Auburn tires, Hart-Bell pumps, F-W automatic windshield cleaners, automatic extension reel lights, H & D shock absorbers, Ajax and Red Devil jacks.

The Wetmore-Savage Co. will exhibit at the Boston show the week of March 13-20, in space 430, Department E, Mechanics' building, where a representative showing of the lines handled by the company will be demonstrated.

MULLINS CO.'S DIVIDEND.

The W. H. Mullins Co., Salem, O., manufacturer of automobile bodies, reports net profits for the seven months ending Dec. 31 sufficient for a dividend of $2.32 a share on common stock.

HAYES WHEEL CO. FORMS COALITION.

The Hayes Wheel Co., Jackson, Mich., has formed a consolidation with the Pioneer Pole & Shaft Co., Piqua, O., and a number of southern branches, which is stated to be merely the logical outgrowth of a long existing relationship. The Pioneer Co., which has been a large stockholder in the Hayes Co. for a considerable period, is the largest operator in hickory wood in the United States, and has supplied the wheel company with material, and the reported merger is formed largely to insure for the Hayes Co. a supply of hickory for its product. The new arrangement will also render available sufficient working capital to carry large stocks of material which the proportions now attained by the organization requires. How great these requirements have become may be judged from fact that consolidated concerns expect to do a business of $25,000,000 in 1920.

H. T. Watkins, Credits Department, Wetmore-Savage Co.

With a production running around 4,000,000 wheels a year, including wire and steel felloe types, the Hayes company is recognized as one of the big factors in this industry.

STERNO CORPORATION TO BUILD PLANT.

The Sterno Corporation, Baltimore, Md., recently incorporated with a capital of $500,000 by interests connected with the United States Industrial Chemical Co., the United States Industrial Alcohol Co. and the Curtis Bay Copper & Iron Co., all of Curtis Bay, is planning the erection of a large plant in the vicinity of Baltimore for the manufacture of alcohol burning devices for automobile service, electric heating and cooking devices, to cost, with equipment, in excess of $400,000.

The incorporators are Patrick H. Loftus, William D. Tucker and Stewart M. Seymour. Carl Haner, Jr., of the United States Industrial Alcohol Co., is also active in the new concern.

R. P. Greene, Purchasing Department, Wetmore-Savage Co.

HEADQUARTERS OF NEW HANDLEY-KNIGHT CO.

The recently organized Handley-Knight Co. has established temporary engineering and purchasing headquarters at 1402 Madison avenue, Toledo, O., pending the completion of the factory buildings at Kalamazoo, Mich.

President J. I. Handley announces the following additions to the personnel of the company: A. E. Schaaf will have direction of engineering and production. He is a recognized authority on high grade motor vehicles, having been until recently the operating head of the F. I. A. T. Co., Poughkeepsie, N. Y. Harry L. Dunn, for many years assistant purchasing agent of the Willys-Overland Co., is to be purchasing agent. Walter A. Olson, formerly division manager in charge of production of the Willys-Overland factory, becomes works manager.

BOWER BEARING BUSINESS SHOWS SURPLUS.

The annual statement of the Bower Roller Bearing Co., Detroit, Mich., recently made public, shows a surplus of $380,872 Jan. 1, before reserves for federal taxes. Assets amounting to $1,043,975 include $275,083 in plant and machinery before the allowance of $129,103 for depreciation; $263,237 in inventories; $150,000 in certificates of deposit; $116,830 in cash and $106,837 in accounts receivable.

The capital stock remains at $600,000 authorized and outstanding, the par value of which is $10 a share.

GOODYEAR ISSUES RACING RESUME.

A booklet giving a resume of the 1919 automobile racing season has been issued by the Goodyear Tire & Rubber Co., Akron, O. It is gotten out in attractive form and is profusely illustrated. It is dedicated to "those courageous young men who drive the racing cars" to whom it is stated "the automobile industry and the great motoring public owe a debt of gratitude for the part they have played in contributing the valuable lessons of the speedways to the advancement of automobile development."

The subject is treated under the following heads: "The Place of Racing in Automobile Development," "Racing Tires," "How Automobile Races Are Timed," "The Pits," "Goodyear Service at the Speedways," "The World's Fastest at Speedways," "World's Fastest Mile on Tires 150 Miles an Hour on Goodyears," "Durant's Triumph at Santa Monica," "Sarles' Ride to Victory at Ascot," "Milton's Drive at Uniontown," "Howard Wilcox's Triumph at Indianapolis—Goodyears First in the American Classic," "New Record at Sheepshead Bay," "Louis Chevrolet's High Score at Tacoma," "Gaston Chevrolet Wins at Sheepshead," 'Milton Repeats at Uniontown," "Milton

M. F. Robbins, Jr., Battery Department, Wetmore-Savage Co.

Leads Revived Elgin Classic," "Boyer Takes Labor Day Event—First Three Cars Goodyear Shod," "Gaston Wins Chevrolet Duel," "Boyer Ends Season with Victory" and "Post Season Racing Review."

This is a compilation that will appeal particularly to the automobile racing enthusiast and any one interested may receive a copy by applying to the Goodyear Co.

ADDITION TO CLEVELAND FACTORY.

The Cleveland Automobile Co, Cleveland, O., will have a factory addition ready for occupancy about March 15 This extension, 200 by 80 feet, four stories high, will increase the total dimensions of the plant to 1000 by 80 feet, containing 320,000 square feet. The factory is located on a 19-acre site on the main line of the Nickel Plate railroad and when the annex is finished will enable the company to reach its desired schedule of 150 cars a day.

Machined to CENTERS is Your assurance of Absolute Accuracy

Another of the Many Details that Make "SPENCER" Stand for Quality

BEFORE we machine a steel bar into an axle or drive shaft, it is center drilled at both ends by machinery. All work on the shaft is then absolutely accurate and the bearing surfaces are sure to be in perfect alignment, because every operation is performed from these centers.

This sort of workmanship means that when you sell a SPENCER guaranteed and trademarked drive or axle shaft, you're taking no liberties with your reputation among the car owners—that you can be dead sure that the "SPENCER" part is equal in quality of the part it replaces.

We are jealous of the "Spencer" Trademark. Any article that bears the "Spencer" name must be at least the equal of any article made by anyone for the same purpose.

That is the policy upon which we have built up our world-wide business and modern, highly efficient factory.

But that quality must not be attained at the dealer's expense. We have made factory efficiency pay for extra quality. Result—Spencer guaranteed products cost no more than any replacement parts. Spencer guaranteed products are sold through jobbers exclusively.

Insist that your jobber fills your orders with Spencer products.

Axle shafts and drive shafts for all popular makes of cars.
Connecting rods, radius rods, fans and mufflers for Fords.
Gilliam take-down taper roller bearings for light cars and commercial trucks.

DEPENDABLE PRODUCTS

FRONT APRON FOR FORD CARS

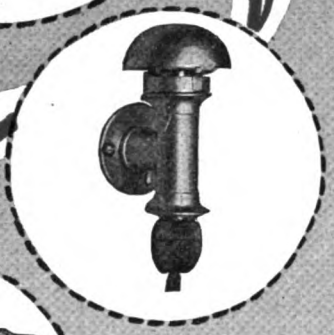
For 1917-18-19-20 Models Only.

This apron makes a wonderful improvement in the appearance of the Ford Car, and for that reason alone is worth the cost, but it does more than that.

Induces a Larger Volume of Air to Pass Through Radiator.
Prevents Mud from Clogging Radiator.
Reduces Risk of Overheating.
Keeps Lamps Clean
Prevents Vibration of Mud Guards.

Made of heavy steel, finished with two coats black enamel and baked. Furnished complete with bolts, nuts and washers. Easy to attach.

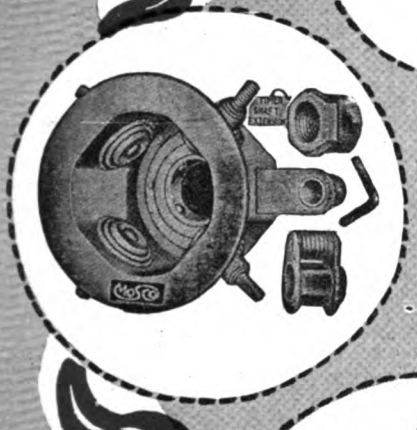
PRICE $6.50



"TUWAY" COMBINATION DASH LAMP and PLUG SOCKET

The "TUWAY" dash lamp affords a combination of refinement and utility. Its pleasing design makes it an ornament to any car, and this design has the added advantage of giving a greater distribution of light from the same candle power bulb than any other lamp made. In addition it has the exclusive feature of a socket into which to plug trouble lamp, cigar lighter, etc., without interfering in any way with the light of dash lamp. The switch is very conveniently placed in the lamp bracket.
The Tuway is made of brass heavily nickel plated and comes complete with bulb and all necessary screws, bolts and nuts for attaching to either wood or metal dash.

PRICE, $2.50 EACH.

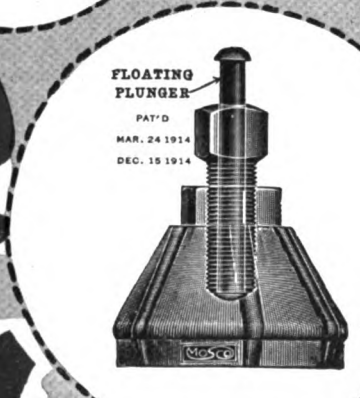


IMPROVED BEMUS BALL CONTACT TIMER FOR FORD CARS

EASIER STARTING—SMOOTHER RUNNING—
LONGER LIFE—SAVES COIL POINTS.

The IDEAL TIMER for the Ford high speed, short stroke engine because form contact is the only one which is correct both electrically and mechanically. This is made by a hardened tool-steel brush coming in contact with steel balls, which are kept in proper position by means of a spring with plug on the end pressing against them. The impact of the brush causes the balls to turn so that a fresh surface is presented for each contact. The brush comes in contact only with the four balls, touching no fibre or insulation. This is a decided improvement over the ordinary type timer, where the roller is constantly wearing grooves in fibre ring which holds contacts. The balls are so located that each has a track of its own on the brush, this insuring a maximum amount of wear.

PRICE, $3.00.



FLOATING PLUNGER WHEEL PULLER

Starts a "Frozen" or "Stuck" wheel instantly. Strike the plunger, turn the screw, strike again and the wheel comes off without injury to hub threads, spokes or axle.
Made for 200 models of 45 popular makes of cars.

Flexedge

SELF-SEATING

LAMINATED VALVES

Sensible-Logical-Inevitable

A Valve Seat Carbon Remover at Work While You Drive

SHOW YOUR CUSTOMERS EXACTLY HOW VALVE CARBONIZATION AFFECTS MOTORS

As the piston goes downward, a partial vacuum is created. A leaking exhaust valve, during the intake stroke, draws back from the exhaust manifold burned gases, which dilutes the fresh gas from the carburetor. Burned gases not only have no power value, but tend to smother combustion, thus lowering the horse power of the motor.

If the valves are imperfectly seated, unburned gas will be pumped into the exhaust manifold, compression will be lowered and the horse power thereby decreased.

During the first half of the explosion stroke the interior of the cylinder contains a burning gas with temperatures running from 3000 deg. to 4000 deg. Fah. and with pressures running from 400 to 700 lbs. per sq. in. If the exhaust valve is imperfectly seated a flame with the intensity of the hottest blow pipe is shot through the tiny opening with a destructive effect and warpage of the valve results. In addition to the destruction of the valves the leakage of pressure causes a lowering of horse power.

In general, carbon deposits are caused by excessive lubricating oil in cylinders, and valve stem guides. Some of this excess oil is of necessity carried to the valve seat. During the exhaust stroke tiny particles of carbon from the burned gas are deposited on the wet seat. Soon the valve is leaking, permitting the escape of flame. Immediately the oil on the seat is burned and more carbon is thus formed. Flexedge valves with their gentle scraping action continually remove these carbon deposits.

Flexedge
SELF-SEATING
LAMINATED VALVES
Sensible-Logical-Inevitable
A Valve Seat Carbon Remover at Work While You Drive

FLEXEDGE VALVES ARE SELF SEATING AND SELF GRINDING—THEY PREVENT THE ACCUMULATION OF CARBON

It's in their design and construction—a perfected and developed use of the laminating and damascening processes known for many years. FLEXEDGE Valves are built up of paper-thin, highly tempered steel discs clamped together under tremendous pressure. They are rigid, except on seating face—elastic only at edges—rapid heat radiators snapping silently but tightly into their seats.

TESTED AND PROVED BY OVER 5,000 DEALERS

Flexing along their elastic edges, like the leaves of a spring, they grind away the carbon as fast as deposited. And they last as long as the motor they are used in, keeping the valve seats clean and bright all the while.

Installed just like other valves, but they soon pay for themselves by ending valve grinding. Order your sample set now and put FLEXEDGE on trial.

The FLEXEDGE principle is shown below with the motion greatly exaggerated in the cuts. In figure (1) you see the valve as it rests in seat during the compression stroke with the discs perfectly flat.
In figure (2) the valve is shown with the edges of the discs curved slightly upwards as the pressure of the explosion causes a minute deflection.
In figure (3) the discs are shown curved slightly downward as happens when the cam strikes its powerful blow. The entire movement is so small as to measure only a tiny fraction of a thousandth part of an inch.

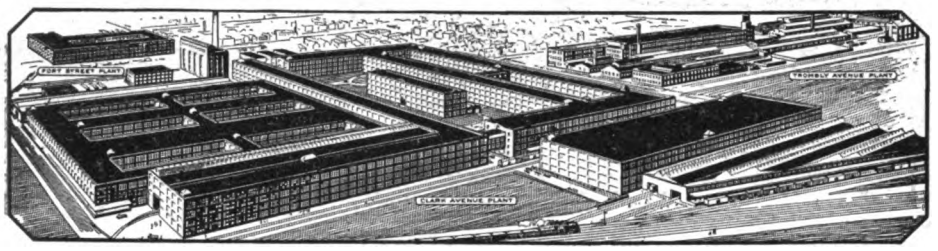
Cadillac's Modern Plant in Detroit

Engineers describe the new plant now being erected for the Cadillac Motor Car Co. in Detroit as the "most modern automobile factory in the world." From the standpoint of railroad facilities the site could hardly be surpassed, as it comprises 46 acres, with the main line of the Michigan Central railroad on one side and the freight tracks of the Lake Shore and Michigan Southern on the other.



New Modern Factory of the Cadillac Motor Car Co., Detroit, Mich.

The buildings of this new plant will contain 2,100,000 square feet, or 48 acres, of floor space. They will all be four stories in height, but are to be so designed that two additional floors can be added at any time. To the eye all the buildings will be seen as a harmonious combination of exposed concrete columns, horizontal bands and red brick walls forming the vast areas of steel sash.

Of the eight buildings comprising the factory, the largest is the manufacturing building, 800 feet long and 600 feet wide, with a total floor space of 1,750,000 square feet when it is carried to its ultimate height of six stories. The courts between the wings will be covered with glass roofs at the height of the first floor ceiling. This will give an area on the first floor 800 feet long and 600 feet wide, or 480,000 square feet.

Conveniently located near the manufacturing building will be the heat treat building, 500 feet long and 80 feet wide.

The assembly building will be the second largest building in the plant, 800 feet long and 360 feet wide, with a total floor area of 620,000 square feet. As in the manufacturing building, the court will be covered with a glass roof, giving an unbroken area on the ground floor of 188,000 square fete. A considerable portion of the assembly building will be devoted to painting operations on chassis, wheels, bodies and metal parts. The body will be upholstered and trimmed in this building, which will also contain the enameling equipment.

The storage building for finished cars and service stock parts, adjoining the assembly building, will be 480 feet long and 140 feet wide. Directly adjoining the storage building will be the "loading dock" with trackage for the placing at one time of 50 railroad cars.

In the administration building, 225 feet long and 50 feet wide, will be located the executive offices.

From the power plant fronting on Clark avenue will be delivered steam, electricity, compressed air, water and the heat required for the operation of the factory. Near the power plant will be located the oil store house with a modern and complete system for the receipt, storage and delivery of the many kinds of oil required throughout the factory. A separate building is also being provided to collect all of the scrap iron, aluminum and brass, and all other materials to be salvaged.

In one wing of the assembly building will be located a welfare department, with first aid rooms, in which doctors and nurses will be in attendance during all working hours. In general, every provision is being made for the comfort and safety of the Cadillac workmen.

ADDITIONS TO JENKINS SPRING CO. PERSONNEL.

T. B. Jenkins, president of the Jenkins Vulcan Spring Co., Richmond, Ind., announces the following additions to the personnel of the organization:

D. T. Hersey, formerly assistant general sales manager for the Splitdorf Electrical Co., Newark, N. J., becomes sales manager with office at Richmond; A. L. Ellis of the spring division of the Detroit Steel Products Co. is production manager.

Direct factory branches are maintained in the following cities: Richmond, Ind., Sixth and Washington avenue; Minneapolis, Minn., 1206 Hennepin avenue; Atlanta, Ga., 48 Auburn avenue; Reading, Pa., 538 Franklin street; Richmond, Va., 2043 West Broad street; Boston, Mass., 819 Boylston street; Kansas City, Mo., 1312 McGee street; Dallas, Tex., 2216-2218 Commerce street.

Stocks at these branches are replenished from the reserve of 100,000 springs at the factory.

PIERCE-ARROW'S RECORD TRIP TO MIAMI.

Driving a Dual Valve Six Pierce-Arrow car, 38 horsepower model, A. A. and F. W. Anderson of Minneapolis, Minn., accompanied by A. G. Seiler, touring manager of the American Automobile association, recently made a 2075-mile trip from Buffalo, N. Y., to Miami, Fla. The journey was accomplished in nine days and 12 hours, part of the route being over primeval roads. The gasoline consumption averaged 12 miles to the gallon and only 11 quarts of lubricating oil were required. The only trouble experienced was a slight radiator leak which was quickly repaired in Jacksonville, Fla.

CLARK EQUIPMENT CO. TO BUILD.

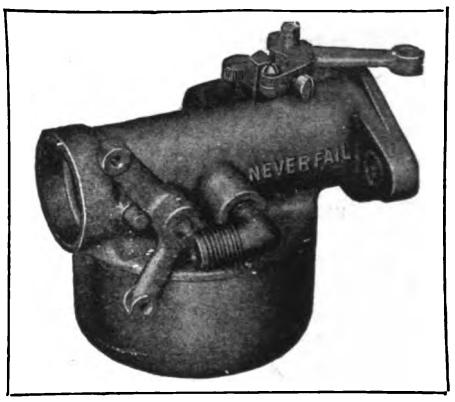
The Clark Equipment Co., Buchanan, Mich., is to build a plant at Battle Creek, Mich., for the exclusive manufacture of axles, on a tract comprising 23 acres with half mile frontages on the Michigan Central and Battle Creek & Interurban railroads. The first units are to be 100 by 450 and 50 by 450 feet respectively, together with a power house and two-story office building. Construction is to be of the daylight type, of steel and brick. It will employ 500 hands when completed.

NEW PARENTI CAR.

The new Parenti passenger car, made by the Parenti Motors Corporation, Buffalo, N. Y., will be placed on exhibition at the automobile show in that city in March. This car will be featured by its light weight and will be equipped with a three by 4½-inch Cameron air cooled engine and, it is stated, will make over 30 miles a gallon of gasoline. The price of the car is $1685. The company is planning a production of 5000 cars for 1920.

NEVERFAIL CARBURETOR.

The Neverfail Carburetor Co., Long Island City, N. Y., has brought out a new carburetor, known as the Neverfail, which is constructed on the principle of a perfect vacuum at all speeds. There are incorporated in the construction no springs, no air valves, no venturi tubes; in fact, no moving parts of any kind except the throttle and the float. The fuel bowl works on a hinge and is designed



The Neverfail Carburetor.

to be easily detachable without the necessity of removing the component from the car.

The Neverfail carburetor is made in various sizes for all makes of passenger cars, motor trucks and tractors, and a special model for Fords is also to be sold through jobbers and distributors.

The officers of the Neverfail company are as follows: President, J. Herbert Ballantine; vice president and general manager, John H. Ballentine; treasurer, J. Bayard Kirkpatrick; vice president and engineer, B. Volkmar; secretary, S. Asch.

The company maintains branches in Detroit and Los Angeles, Cal. The factory address is 192-200 Jackson avenue, Long Island City, N. Y.

American Cars Popular in Chile

It is stated by a bulletin recently issued by the Latin-American division of the United States Bureau of Foreign and Domestic Commerce that American automobiles have become remarkably popular in Chile during the last five years. This has not been wholly due to the elimination of European sources of supply during the war period, but largely the result of a growing familiarity with the conveniences of motor driving combined with the discovery that these advantages are possible for people of moderate means through the comparatively low prices of certain American cars. And, moreover, the high grade American makes have been demonstrated with success to the class of Chileans that can afford expensive machines. In the social life of the cities the motor car has become an essential, replacing the family coach or carriage, it is said.

Outside of the cities the lack of good roads in Chile seriously affects the use of automobiles, for two mountain chains extend the 2500 miles of the country's entire length and in the mountainous regions road construction is a problem. Between the mountain ridges are level areas, but even here the scarcity of good roads prevents much touring.

War restrictions on the manufacture and shipment of automobiles reduced the exports of cars from the United States to Chile in 1919 to one-third the number and less than one-half the value of the cars shipped in 1918. The largest item in this trade in 1919 was passenger cars, and the second automobile tires. The second item was the only one that did not fall off in the 1919 period; on the contrary, imports of tires increased about 50 per cent. The roads of Chile are specially severe on tires, and this explains why shipments of tires to that country show such a tremendous increase in the period from 1913 to 1919. Exports of motor trucks, the number of which had increased over 300 per cent. in 1918, dropped about 30 per cent. in 1919, but indicated a rapidly growing tendency toward the adoption of motor freight transportation. While imports of motorcycles and automobile parts in 1919 showed slight declines from the 1918 figures, they were much larger than in any other previous year.

Shipments of automobiles from the United States to Chile have represented practically all of Chile's trade in this line since 1916, but the United States' share of this business in 1913, the last pre-war year, was but little more than eight per cent.

NEW CAR DESIGNED EXCLUSIVELY FOR FOREIGN TRADE.

American Motors, Inc., is manufacturing a new car designed exclusively for foreign trade, to comply with existing conditions abroad. The maker claims for this product that it breaks away from the former practise of American automobile manufacturers who have made no particular effort to meet actual conditions abroad, but have built up their export trade on their ability to undersell the market.

None of the cars will be held in the home market, the manufacturer claims, and thus the foreign purchaser will be enabled to get the car that meets his requirements at a lower cost than would be possible if the car were bought in his own country. In the design of the car American Motors claims to have chosen only the best features of the standard American cars.

RAINIER TRUCKS IN INDIA.

The New York Overseas Co. has recently shipped to India 50 Rainier worm-driven delivery trucks, made by the Rainier Motor Corporation, Flushing, Long Island, N. Y., the last shipment including two for Bombay and six for Calcutta.

In some sections of that country the automobile is rapidly supplanting elephants, which have for centuries been one of the principal means of transportation.

DUTCH EAST INDIES.

Among the principal articles listed as demanded and imported into the Dutch East Indies are low-priced motor cars and accessories. Export restrictions on these have generally been lifted.

A new chamber of commerce for the Netherlands and the Netherlands East and West Indies is being organized to further the trade between these countries and the United States.

Exports of manufactures from United States in 1919 were $10,000,000 a day.

Small Cars Preferred in Japan

In Japan it is reported that small or medium types of passenger cars are preferred, as the narrow streets and congested traffic place a large car at considerable disadvantage. Closed cars are preferred, especially for private use, on account of the dust in the streets and also because the Japanese women do not wear hats, and their carefully arranged coiffures suffer considerably in open cars. A closed car also offers a better means of crowding in an extraordinary number of passengers without attracting undesirable attention. An imported chassis is often fitted with a Japanese made body in order that the seats may be of the size and height most suitable to the Japanese, and also to provide seating arrangements for a larger number of passengers than is usual for cars of the same make in the United States. In general cars of types suited for city use in the United States are suited for the Japanese market. There is, however, a demand for automobiles at mountain summer resorts where engine power and safety of control are the chief requisites.

MARKET IN THE PHILIPPINE ISLANDS.

American motor vehicles continue to predominate in the Philippine market. In 1918, 4318 passenger cars with a total capacity of 22,817 were registered. The five-passenger car is the most popular, according to the registration figures, with a total of 2153 cars, while seven-passenger cars stand second with 1171 registrations. Two-passenger cars total 459, four-passenger cars 181, eight-passenger cars 108, three-passenger cars 107, six-passenger cars 94, 10-passenger cars 37, and nine-passenger cars 16.

The total number of trucks registered in 1918 was 567, with a tonnage capacity of 1052 and a passenger capacity of 6345. Due to the lack of railroads and the need to transport agricultural products, motor trucks are beginning to play an important part in the country's commerce.

DEMAND FOR CARS IN SWEDEN.

The present demand for automobiles in Sweden is 300 per cent. greater than that prevailing in 1914.

A Ford Controlling Itself

The Over-land-Guide PATENTED **Controlling the Ford**

Just What We Guarantee

The Over-Land Guide is an over the counter business getter. A wonder seller wherever shown. Winter or summer the demand is the same.

THIS BROAD GUARANTEE PROTECTS USERS OF THE OVER-LAND GUIDE. Send us retail price, and we will send you parcel post, one Over Land Guide. Use it 20 days, and if at the end of that time you are willing to part with it, full purchase price will be refunded upon its return. **$8.50**

WITH AN OVER-LAND GUIDE

The driver of a Ford car or truck can steer the machine with the tips of his fingers.

The wheels will always keep in alignment over rocky, rutty or hilly roads, through sand, gravel, mud holes or washouts.

Even though the steering gear be broken or fails to work, the Over-Land Guide will continue to keep the Ford car or truck on a straight course.

It protects the entire front system and steering mechanism from undue wear and breakage. The Over-Land Guide absorbs all shocks and stresses.

It eliminates all danger from a blow out of a front tire at any speed, as the Over-Land Guide will hold the Ford car or truck to its course.

It Stops All Wabbling, Scooting and Creeping

It eliminates all strain in driving. It will save in time and car service. It is car insurance of the highest order. It insures against ditching of the car, which oftentimes proves fatal to the occupants.

The Over-Land Guide cannot fail to work or get out of order. It is finely made, sightly and will last for years.

Estimate the worth of an Over-Land Guide from any viewpoint—safety, service and dependability.

It will add generally to car efficiency, convenience, pleasure and comfort, and assures the longest possible service life to a Ford car or truck.

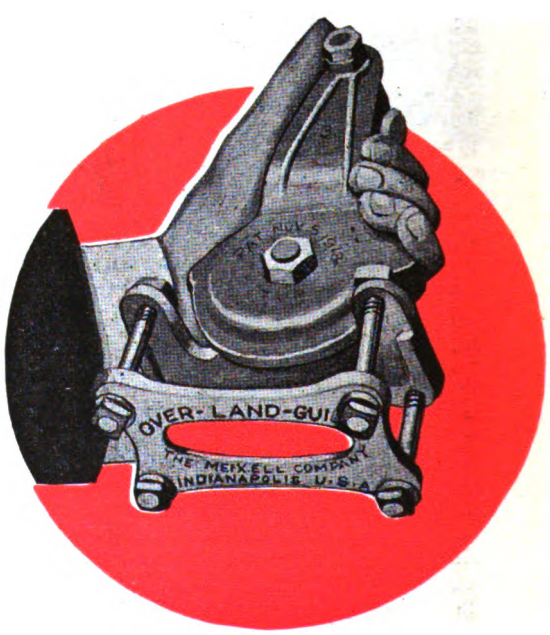
The Over-land Guide Protects These Parts

Spindle connecting rod (or tie rod). Spindle body arms and bushings. Spindle body and bushings. Ball and roller bearings and hub. Steering connecting rod and ball joints. Steering gear ball arms. Steering post bracket, bushing and bolts. Steering post. Steering gear pinion. Steering gear drive pinions. Steering gear internal gear case and bushings.

Also helps to keep axle from breaking or bending—and may save the entire car from destruction.

Jobbers and Dealers—We offer a 100% utility attachment. All Ford car and truck owners will buy at sight. Sales are limited only to the number of Fords in use. The market is everywhere. Our proposition is liberal and the discounts will satisfy you.

Write or wire for full particulars.



The OVER-LAND GUIDE bolts to the center of the front axle and the center of the spindle connecting rod (or tie rod), securely relieving the vibration and strain in the spindle connecting rod (or tie rod) and the entire front system, and the steering mechanism up to the steering wheel. Can be attached in a few minutes by anyone.

A New Standard—

the Hand-Built Madison

We wish we could show you the hands that lay on—carefully—each ply of the rubber-filled fabric; the hands that pull and test—carefully—every inch of each layer as the tire is built; the hands that find and reject—instantly—every flaw that might have remained hidden until the wear of the road found it out, too late.

Madison

SUPERB ENDURANCE

Tires

Superb Endurance, no less than cotton and rubber, enters into the very structure of the ***Hand-Built*** Madison Tire.

The six buildings of the Madison factories at Buffalo, N. Y., total a quarter million square feet of floor space, with complete modern equipment. The demand for a better tire has been so great that the output capacity is being constantly increased. At the same time the moral obligation in craftsmanship, which has made the ***Hand Built*** Madison the new standard of tire endurance, is rigidly upheld.

We have an unusual proposition for the RIGHT KIND of dealer—the dealer who can see far enough ahead of the crowd to realize what it will mean to him to SELL the HAND-BUILT Madison.

Madison Tire and Rubber Company, Inc.

254 West 57th. St., City of New York

Motor and Accessory Makers' Officers

AT ITS 16th annual meeting the Motor and Accessory Manufacturers' Association elected three new members to its board of directors. The full board is as follows:

C. E. Thompson, Steel Products Co., Cleveland, O.; E. H. Broadwell, Fisk Rubber Co., Chicopee Falls, Mass.; Christian Girl, Standard Parts Co., Cleveland, O.; W. O. Rutherford, B. F. Goodrich Co., Akron, O.; L. M. Wainwright, Diamond Chain & Manufacturing Co., Indianapolis, Ind.; G. Brewer Griffin, Westinghouse Electric & Manufacturing Co., New York; E. E. Allyne, Aluminum Manufacturers, Inc., Cleveland, O.; E. W. Beach, Ferro Machine & Foundry Co., Cleveland, O.; G. W. Yeoman, Continental Motors Corporation, Detroit, Mich.; E. P. Hammond, Gemmer Manufacturing Co., Detroit, Mich.; J. M. McComb, Crucible Steel Co. of America, Pittsburgh, Pa.; A. W. Copland, Detroit, Gear & Machine Co., Detroit, Mich.

Messrs. Allyne, McComb and Griffin succeeded C. W. Stiger, president of the Stromberg Motor Devices Co., Chicago. Ill.; J. H. Foster, president of the Hydraulic Pressed Steel Co., Cleveland, O., and T. J. Wetzel, president of the Precision Die Castings Co., Syracuse, N. Y.

The officers for 1920 are:

President, C. E. Thompson, president of the Steel Products Co., Cleveland, O.; first vice president, E. H. Broadwell, vice president of the Fisk Rubber Co., Chicopee Falls, Mass.; second vice president, Christian Girl, president of the Standards Parts Co., Cleveland, O.; third vice president, W. O. Rutherford, vice president of the B. F. Goodrich Rubber Co., Akron, O.; treasurer, L. M. Wainwright, president of the Diamond Chain & Manufacturing Co., Indianapolis, Ind.; secretary and assistant treasurer, G. Brewer Griffin, manager of the Automobile Equipment department of the Westinghouse Electric & Manufacturing Co., New York.

Mr. Griffin succeeds Thomas J. Wetzel.

The committees are as follows:

Executive: Messrs. Thompson, Broadwell, Girl, Rutherford, Hammond, Griffin and Copland.

Finance: Messrs. Broadwell, Thompson, Girl, Rutherford, Yeoman, McComb and Copland.

Show and Allotment: Messrs. Girl, Rutherford, Yeoman, Griffin and Allyne.

Auditing: C. E. Thompson, president; G. Brewer Griffin, secretary; L. M. Wainwright, treasurer.

Membership: Messrs. Rutherford, Beach and Wainwright.

Banquet: Messrs. Rutherford, Girl, Yeoman, Hammond and McComb.

The New England Mills Co., wholesale jobber and distributor of automobile and truck accessories, 1219-1221 Michigan avenue, Chicago, Ill., announces that its new spring catalogue is now ready for distribution and that dealers interested in automotive supplies will receive a copy on application.

PIERCE-ARROW TESTS ENGINES WITH MODERN DEVICES.

The Pierce-Arrow Motor Car Co., Buffalo, N. Y., has just installed what is claimed to be one of the most effective pieces of motor testing apparatus employed in any automotive plant in the country. This improved method is as follows:

Each engine passes through three stages. It first is driven electrically until the moving parts are worn in, whereupon the engine is run for a number of hours under its own power at various speeds. Throughout this entire period instruments reveal accurately the internal friction of the engine, its speed and the horsepower developed.

The engine then is disassembled and the parts inspected by experts, who rebuild it after making adjustments or corrections.

In the final stage, the engine is coupled with a dynamometer in a silent room. At this stage of the test are recorded complete data as to power, gasoline consumption, internal friction and other vital facts. Here, too, the tester adjusts ignition, carburetion, valve action, etc., so that when the final "O K" is given, a perfect engine is ready for the chassis.

LANE VISITS PACIFIC COAST.

Ralph S. Lane, president of the United Motor Service, Inc., and the Bearing Service Co., Detroit, is making a tour of inspection of the Pacific coast branches of those companies, located at San Francisco and Los Angeles, Cal.; Portland, Ore., and Seattle, Wash.

The United Motor Service, Inc., is the official service department of Delco, Klaxon and Remy products, and has 22 branches and 137 authorized distributors. The Bearings Service Co. is the national service department of the Hyatt, Timken and New Departure companies, and has 26 direct branches and more than 900 authorized distributors.

Ralph S. Lane, President of United Service, Inc., and Bearing Service Co., Detroit.

ANNUAL EARNINGS OF MAIBOHM MOTORS.

According to the annual report just issued by the Maibohm Motors Co., Sandusky, O., the earnings for the year past totaled $139,745, of which $89,714 was charged off to cover depreciation and taxes. The gross earnings amounted to 16 per cent. and sales in 1919 showed an increase of 247 per cent. over 1918. These results were obtained despite restricted production and increased expenses during the year due to the destruction by fire of the plant at Racine, Wis., just before the first of 1919, and the moving of the organization to Sandusky in the spring.

The company is now on a production schedule of 25 Maibohm Sixes a day and for 7500 during 1920, all of which have already been sold to the Maibohm dealer organization.

GEMCO 1920 CATALOGUE.

One of the most interesting of the 1920 automobile supply catalogues is that just issued by the Gemco Manufacturing Co., Milwaukee, Wis., which illustrates and describes a large number of popular and successful devices for motor cars. Especially notable is the complete line of bumpers for all cars.

It contains a double cross reference index, which renders the finding of either descriptive matter or illustrations a very simple matter, as the makes of automobiles are listed alphabetically and opposite the names appear the numbers of the pages on which the bumpers for the cars are shown. This catalogue will be sent free to anyone interested.

GENERAL ELECTRIC TO MAKE CAPITAL $175,000,000.

The stockholders of the General Electric Co., Schenectady, N. Y., will take action at a meeting called for March 16 on a project to increase the capital of the company from $125,000,000 to $175,000,000 and to issue $15,000,000 of six per cent. 20-year debenture bonds.

Total sales of the General Electric Co. for 1919 are reported to have been $230,750,010 as against $216,815,277 in 1918. Of these sales the net income for 1919, before charges for interest, etc., was $38,685.067. On Dec. 31 assets other than cash were in excess of $236,000,000, and $31,000.000 in cash. Total liabilities on that date were $50,000,000 making the balance $217,000,000 in favor of assets, or $190,000,000 in excess of all debentures, including the present issue.

The Western Electric Co. also proposes to increase its stock from 15,000 shares of no par value to 500,000 also of no par value, and to issue $50,000,000 of seven per cent. cumulative preferred stock. This will add more than $30.000,000 to the company's working capital.

NORTHWESTERN CHEMICAL'S ANNUAL SALES CONVENTION.

The annual sales convention of representatives of the Northwestern Chemical Co. Marietta, O., opened Monday, Feb. 16, with R. M. Tusing, general sales supervisor, presiding. The addresses, all of which were helpful to a degree in stimulating the activities of the organization, included the following: Opening address, "Destructive Unrest," Fred Hall, president and general manager; "The Relation of the Accounting Department to the Success of the Organization," H. A. Fordham, secretary-treasurer in charge of the accounting department; "Keeping Raw Material Coming in and Finished Goods Going Out," O. W. Morgenstern, purchasing agent and production manager; A. S. Isaacs, chief chemist, spoke of the strict laboratory supervision all Norwesco products were obliged to undergo; "Selling the Dealer," V. V. Casey, eastern sales supervisor; "What Is Necessary of a Salesman," L. D. Speed, central sales supervisor; "My 10 Years' Experience with Norwesco," I. D. Gross, western sales supervisor; "Getting the Good Will of the Buyer," S. E. Samuels, New England salesman; "The Man Who Came Back," M. P. McGee, Metropolitan district salesman; "Bumps of a New Salesman," L. G. Meredith, Ohio district salesman.

The programme for Tuesday included a session in the morning in which the various Norwesco utilities were described by President Hall and in the afternoon Chief Chemist Isaacs gave some interesting and convincing laboratory tests. In the evening the convention attended the Hippodrome theater in a body, where the company also had as guests the Advertising club of Marietta, the Parkersburg and Marietta Credit Men's association and the Marietta Purchasing Agent association.

Wednesday morning was taken up by Mr. Tussing, general sales supervisor, in exploiting the Norwesco line, the policy of the house, its past record and plans for 1920. The afternoon was spent in going over the advertising campaign. Wednesday evening the company gave a love feast at which it had as guests the outside and inside sales organizations, the department heads and directors of the company.

Thursday was particularly devoted to "Se-ment-ol," one of the principal products of the concern, and an addition to this line, Boiler Se-ment-ol, was exploited. The convention came to a close Thursday night.

CADILLAC METAL PARTS COMPANY FORMED.

The Cadillac Metal Parts Co. has been formed at Cadillac, Mich., to make tanks, hoods, fenders and other parts for automobiles. The incorporators are L. J. Deming, C. F. Williams and E. J. Morgan. The manufacturing activities of the Cadillac Plumbing & Heating Co., in which the incorporators are interested, will be taken over by the new concern.

Eaton Becomes Head of Standard Parts

Christian Girl, organizer and president of the Standard Parts Co. of Cleveland, O., one of the largest independent producers of automobile parts in the world, has been deposed from office under pressure from certain banks, and is to be replaced by J. O. Eaton, formerly of the Torbensen Axle Co., now head of the Eaton Axle Co. Associated with Mr. Eaton in the new management of the Standard Parts Co. will be, it is understood, John Younger, formerly truck engineer of the Pierce-Arrow Motor Car Co., and Charles S. Dahlquist, sales inspection engineer of the Timken-Detroit Axle Co.

It is stated that Mr. Girl's enforced retirement was the price demanded by certain financial interests for the refunding of the corporation necessitated by the exigencies of its reconstruction. The underlying refinancing operation is being handled entirely by and through interests in Cleveland, and will take the form

J. O. Eaton, New President Standard Parts Co. of Cleveland, O.

of a $25,000,000 merger involving the consolidation of the Eaton Axle Co. with the Standard Parts Co. It is implied, however, that the real cause of this action lies in the fact that Mr. Girl, as the advocate and exponent of the standardized war truck, incurred the animosity of powerful financial interests in his home city.

Mr. Girl came into prominence in the automotive industry in 1906 as the founder of the Perfection Spring Co. and piloted that concern through its development to an organization with a capital of $1,500,000, doing a business of some $5,000,000 a year. This concern was merged with the Standard Parts Co. in 1916, other concerns included being the Standard Welding Co., the Western Spring & Axle Co., the American Ball Bearing Co. and the Bock Bearing Co.

In 1918 he became director of the Military Truck Production section of the Quartermaster General's office in Washington and as such organized the parts makers for the manufacture of the famous class B truck. Later he was mentioned as the probable head of the Motor Transport Corps, then forming, but it was finally decided to select its personnel from the regular army.

The latest development of the Standard Parts Co., which is stated to be in every respect a normal process and in no wise casting any reflection on its past conduct or present stability, was formally announced in Cleveland on Feb. 11 by Cyrus S. Eaton of Otis & Co. The capital of the revised enterprise will probably be about $35,000,000, and it is expected that the consolidated companies will be doing a business of $60,000,000 annually by 1921. The present activity may be judged from the statement that unfilled orders on the books now are in excess of $23,000,000.

ANDERSON ELECTRIC CO. CHANGES NAME.

The stockholders of the Anderson Electric Specialty Co., Chicago, Ill., manufacturer of the well known Anderson "Autoreelite" spot light and "Reelite" extension garage portable light, have sanctioned a resolution authorizing the change in name of the company to Anderson Electric & Equipment Co.

This includes no change either in the company's officers or organization, and has been made solely to render the corporate name more descriptive of the character of the products manufactured by the company and to eliminate the word "specialty," which did not properly describe the Anderson lines, which are staple articles and known throughout the automotive market.

HENDRICK'S COMMERCIAL REGISTER.

The new 28th annual edition of Hendrick's Commercial Register of the United States for Buyers and Sellers has just been issued. It has been thoroughly revised and contains many new listings, together with several new features. This has come to be recognized as one of the most valuable works of reference for the business man being especially devoted to the architectural, engineering, electrical, mechanical. railroad, iron, steel and kindred industries, and contains, in a comprehensive form much interesting information that can be found in no other work of similar character.

The publisher is the S. E. Hendricks Co., Inc., 2 West 13th street, New York City, and the list price is $12.50.

BIG ORDER FOR HAYNES CARS.

Harold Oppenheimer, president, and E. M. Tharp, manager, of the Midwest Haynes Automobile Co., Kansas City, Mo., have recently filed orders with the Haynes Automobile Co., Kokomo, Ind., for 129 Haynes cars of both open and closed models, totaling over $250,000.

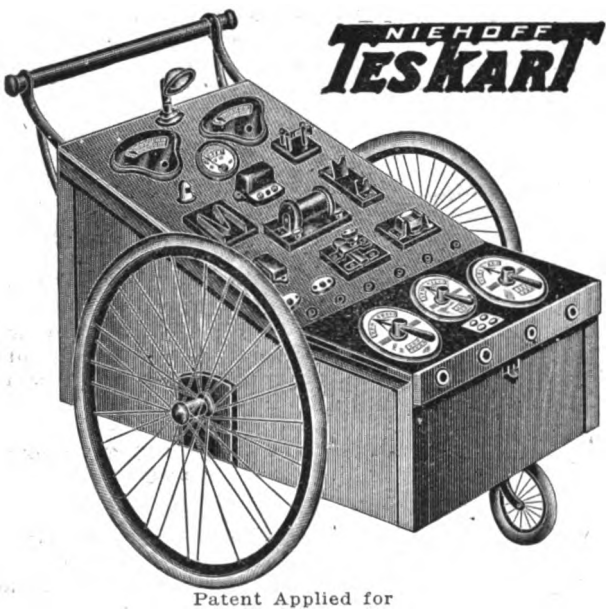
Niehoff Automotive Repair Shop Equipement



Patent Applied for

The NIEHOFF TEST KART is the latest achievement in the way of a complete Testing Outfit for locating all electrical trouble in the ignition, starter, generator, battery, wiring, relays, meters, in fact anything in connection with the electrical mechanism of an automobile. It will also recharge Ford magnets on the car. This outfit is a necessity in every repair shop. With it you can render a service to the motorist that will insure you increased business. It will enable you to inform the motorist intelligently, just what has to be done and give him an estimate as to the approximate cost.

The NIEHOFF TEST KART is the ideal rig for the general automotive garage service station. Price, **$350.00.**

We list below a few other important testing outfits.

Niehoff Defectometer—For testing magnetos and coils. Price, **$50.00.**

Niehoff Generometer—For locating shorts in starting and generator armature. Price, **$55.00.**

Niehoff Mag-Charger and Testing Outfit for Fords—Will recharge Ford magnets on the car, burn out shorts, test coils, spark plug, voltage of magneto, etc. Price, **$60.00.**

Niehoff Growler—To test armatures. Price, **$30.00.**

Niehoff Laminated Magnetizer—To recharge all sizes of magnetos for automobiles.
Storage Battery model. Price, **$25.00.**
110 D. C. Current model. Price, **$30.00.**

Niehoff Power T. B. Test Bench—To test generators and magnets after assembled.
Complete with motor. Price, **$550.00.**

KHK OIL SIGNAL

DEALERS!

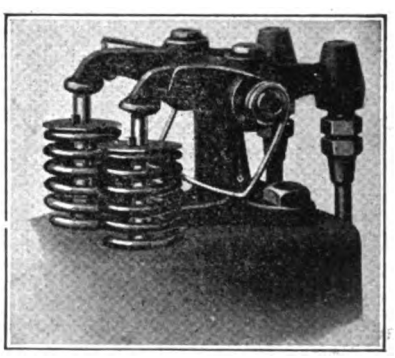
Here's Another Fast Selling KHK Accessory

"When Your Oil is Low Your Horn Will Blow"

Automatically starts horn blowing when oil supply is low. Insurance against burned out bearings, scored pistons and cylinders. Fits all cars. A novel, practical accessory that sells on sight. Popular price. It's the only practical automatic oil signal on the market. Easily attached and no complicated parts to wear or get out of order. Be the first dealer in your town to show this new accessory. It will pay you.

STOP THAT NOISE WITH

KHK Valve in Head MOTOR SILENCERS



Guaranteed to eliminate from 75% to 90% of that clacking noise caused by the action of push rods and rocker arms in Buick, Chevrolet, Oakland, Oldsmobile, Scripps-Booth motors. Adds pep to motor. Eliminates continual tappet adjustment. Dealers say it is the fastest selling accessory they ever saw.

The Problem of Car Production

By W. O. Rutherford, Vice President, the B. F. Goodrich Rubber Co.

IT HAS always seemed to me that there is a good deal of sound philosophy in Benjamin Franklin's statement that we should beware of croakers. This advice is as sound today as it was 100 years ago. All industry has been confronted with menacing conditions during the months and years just past, but I am optimistic enough to believe that every major development in our international growth, in our civic reforms and in our economic readjustments will lead us to bigger and better things for the future. Every one of us should be an optimist, there is no room for pessimism.

By referring to one of my charts I notice that in 1905 there were 150,000 automobiles in the country; 15 years later we have passed the 7,000,000 mark. Now I hear much about the "saturation point" and that other indefinite period when we shall have "diminishing returns." Automobiles come in the "consumption" class of commodities; i. e., they are used, worn out—and replaced as an essential part of life just as clothing is. I forecast that we shall be able to absorb not only the present automobile production, but we shall even sustain the greater growth which ambitious manufacturers are meditating.

Hence it is a problem of production and every citizen, from the management to the worker at the bench, should do his share toward keeping an uninterrupted flow of raw materials and finished goods going through the mills, warehouses and stores of this country and every man has a right to share in the fruits thereof. In no other line of industry are the relations between capital and labor on a friendlier or sounder footing than in the automotive field, hence there should be no cause for apprehension.

So far as passenger vehicles are concerned we are now at the crest of a buying market. Production does not equal demand and personally I expect this condition to exist for some time to come. I recall being told at one of the New York shows way back in 1907 that the then annual production of 60,000 cars marked the peak point in automobile manufacture and that the number of cars to be made annually would lessen rather than increase. Just as that prophet of gloom was suffering from brain storm so will I also classify those who today are refusing to advance with the times. The proposed car production for 1920 is 3,000,000 cars. An analysis of the market, at home and abroad, shows an ability to absorb even greater production, hence the possibility of a shortage of cars is imminent.

Rural Districts Disappearing.

The average reader may say, "Well, this growth of the automobile industry is all very nice, but wherein does it affect me?" Anything relating to the third largest industry in the country affects everyone. Thus within the past 10 years our cities have undergone a wonderful transformation. A decade ago Chicago boasted that it was 40 miles from one side of the city to the other. We marveled. But today cities having a population of only 2000 or 3000 spread themselves over as large an area. In some of our states the country is no longer rural, it is interurban. Think what this means for health and culture; again think what it means for real estate values.

(A certain authority estimates that for every million dollar's worth of automobiles produced there is produced another million dollar's worth of property values). Now consider how important it is that we should have a net work of highways in every community for freight and passenger traffic. Someone has said that highways are the measure of civilization. I believe this implicitly. So in the final summary my conclusion is that

W. O. Rutherford, Vice President, B. F. Goodrich Rubber Co.

the number of cars produced during the years to come does not rest with a group of manufacturers in the central west, but lies rather in the hands of the general public. Authorize the building of suitable highways and the manufacturers will motorize them, greatly to the advantage of the community and the individual.

SAN FRANCISCO NATIONAL AIR CRAFT SHOW.

The first national aeronautic exposition to be held on the Pacific coast will take place at the Exposition Auditorium in San Francisco, April 21-28. This will be one of the three big national expositions of air craft to be held in America this season, and this San Francisco showing will include the displays made earlier in Chicago and New York and will be supplemented by new designs which could not be assembled in season for exhibition at the earlier shows.

The San Francisco exposition has the sanction of the Manufacturers' Aircraft association.

The town of Islesboro, Me., has voted against the repeal of a law prohibiting the use of motor cars within its limits.

ANNUAL MEETING, FULLER MANUFACTURING CO.

The Fuller & Sons Manufacturing Co., Kalamazoo, Mich., maker of transmissions, controls and multiple-disc clutches for motor trucks, at its recent annual meeting re-elected the old board of five directors. The following officers were elected:

President, Frank D. Fuller; vice president and chief engineer, L. C. Fuller; secretary and sales manager, W. P. Fuller; treasurer, W. E. Upjohn.

Actual shipments for 1919 were reported to be 82 per cent. in excess of 1918, totaling almost $2,500,000. Shipments for January were far above the average for 1919 and the volume of business booked will tax the facilities of the company to the utmost. Another four-story reinforced concrete building, 60 by 100 feet, has been contracted for, which will replace the old factory. A steel warehouse, 30 by 100 feet, is also to be erected to replace the temporary wooden one, and a gray iron foundry is being put in which is expected to begin operations by March 1.

The company has purchased 10 acres of land north of its present plant to provide room for future extensions, which is bounded by the Grand Rapids & Indiana railway on the west side and an extension of the Grand Trunk on the east. It is planned to erect a large modern office building on this land and probably add another large unit to the main factory early in 1921.

NO CHANGE IN DODGE POLICY.

Definite assurance that there will be no change in the policies of Dodge Brothers, maker of the Dodge car at Detroit, as a result of the recent death of its president, John F. Dodge, has been given in the form of a letter addressed to Dodge dealers by Horace E. Dodge, who is now the head of the company. This announcement states in part:

"The business will be conducted in the future exactly as it has been in the past—the same principles of honor, honesty and integrity that dominated his life will continue to dominate the business of Dodge Brothers. There will be no change and you can safely make your plans for the future in reliance upon the same whole-hearted support of Dodge Brothers that has been given to you in the past."

GILLIAM CO. ADDS TWO DIRECTORS.

The Gilliam Manufacturing Co., Canton, O., maker of Gilliam bearings, has voted to increase its board of directors from seven to nine members. It is made up as follows: President-treasurer, B. T. Steiner; vice president, P. K. Davis; vice president and assistant treasurer, W. H. Steiner; secretary, S. G. Zimmerman; general manager roller bearing division, George Lee Miller and M. S. Milbourne, H. B. White, W. L. Malotte and Clarence G. Herbruck.

The executive board consists of Messrs. B. T. and W. H. Steiner, Miller, Zimmerman and White.

Business Builders

You sell goods that have quality. Please customers and bring them back to your store. Simple in their application.

Attractive lithographed cans with complete directions printed on back of each can.

Well advertised in leading Trade and Farm Papers.

Peerless Automobile Specialties

Make Old Cars Look Like New

Notice:—Dealers and Jobbers

You receive cooperation and are furnished with selling helps, such as Window Display Materials—Inslips—Catalogs, etc. The selling policy is right—therefore the goods will sell and repeat.

PEERLESS MOHAIR TOP DRESSING

Waterproofs and dresses mohair, canvas and duck tops with one application. Dries over night, leaving top soft and pliable. About one pint for runabout; quart for five-passenger car top.

PEERLESS CUSHION DRESSING.

Without danger of washing or rubbing off, it brightens and renews the finish on leather seats and cushions. Dries in about thirty minutes. About one pint for cushions of small car; one quart for large car.

PEERLESS BLACK JAPAN—Extra Fine.

A fine product for all around use on wood, metal and old painted or enamelled parts. Will cover solid with one coat and air dries with a fine black gloss finish.

PEERLESS GASKET SHELLAC.

A high grade product for gaskets, cork carburetor floats and such parts of an automobile. Put up in all size cans and 2-oz. bottles.

PEERLESS RIM PAINT.

Made for recoating automobile rims to keep them from rusting, which causes tires to stick, which is injurious to rubber. It is not affected by water.

About one pint for rims of a car.

PEERLESS TOUCH-UP BLACK.

Made to dry quickly for touching up all parts of automobiles, on wood and metal where paint has chipped off or where you desire to coat some special part to improve its looks and as a protection from dust.

PEERLESS LEATHER TOP DRESSING.

An oil dressing to renew the finish and keep leather, rubber and pantasote tops and curtains soft and pliable. About one quart for five-passenger car top.

PEERLESS LINING DYE.

A very strong dye that will make all water-stained, grease spotted and faded linings a dark uniform color and will not wash or rub off. Will not harden or stiffen the cloth.

About one quart for five-passenger car top.

PEERLESS FORD TOP DRESSING.

Made to dress Ford Top Material that has become dull and make the top look like new. Will dry over night and wear indefinitely.

One pint for a runabout; one quart for a touring car.

PEERLESS TIRE PAINT.

A waterproof coating for tires containing nothing injurious to rubber and keeps tires looking bright and new.

One pint will cover five regular casings.

PEERLESS FENDER JAPAN—Jet Black.

An air drying jet black enamel for finishing fenders of an automobile. Will cover solid with one coat over new metal or old enamelled fenders.

PEERLESS COLOR FINISHINGS

Enables an owner to paint the body, wheels and chassis of his car his favorite color. The goods are high grade solid covering colors, made with a finishing varnish so that it is not necessary to finish over them.

The continued use by over 8000 leading Automobile Painters endorses the Quality.

FISK
TIRES

THE dealer who wants to make money and to *keep on* making it will weigh each of these eight factors carefully before choosing a tire line—

The ability to deal *direct* with the manufacturer; the *quality* of the tires; the *appearance* of the tires; the *completeness* of the line; the *attitude of the public* toward the product; the manufacturer's advertising; the manufacturer's *distribution* facilities; and, most of all, the attitude of the manufacturer toward the dealer.

Actual investigation along these lines will lead to the choice of Fisk.

The Fisk ideal is: "To be the best concern in the world to work for, and the squarest concern in existence to do business with."

BLUE RIBBON PRODUCTS

Are a Standard Line

Jobbers and Dealers stock the full Blue Ribbon line as they do all other tried, proven and constantly selling goods.

Blue Ribbon products are made by specialists who depend wholly on the quality and service giving satisfaction afforded by lines bearing their trade mark.

There can be no experimentation at the expense of the consumer, dealer or jobber. All Blue Ribbon Specialties must be as good as they are practical in every day use as it is possible to make them.

A nation wide trade, enormous expenditures devoted to development and promotion work as well as the maintenance and operation of the largest plant of the kind in America is too great a stake to gamble against quality.

Blue Ribbon Products today stand supreme. They are passed over the counters backed by an unqualified guarantee on the part of the trade that can leave no doubt as to their merits.

That is why Blue Ribbon Products are a standard line and will always continue to be so.

That is why all jobbers and dealers sell and list them in their catalogues.

Above all else that is why the consumer buys Blue Ribbon trade marked products. Blue Ribbon Products cost no more than others, yet represent the most profitable line that can be placed by the jobber or dealer.

If the **BLUE RIBBON** trade mark is to be seen on your shelves or counter you have a silent salesman in your store that is always working, always earning.

All Blue Ribbon Specialties are sold in quantities to meet any requirement.

The full line affords a complete line and it pays to specialize in known quality goods.

Blue Ribbon Specialties Include:

Blue Ribbon Cold Cream Hand Soap
Contains no pumice or sand.

Blue Ribbon Leak Proof Cement
A permanent radiator cement.

Blue Ribbon Nickel Polish
For nickel parts and trimmings.

Blue Ribbon Auto Body Gloss
For automobile or furniture.

Blue Ribbon Lightning Carbon Remover
Quick and positive in action.

Blue Ribbon Black Enamel
For lamps, hoods, radiators and metal parts

Blue Ribbon Auto Top and Seat Dressing
A waterproof dressing that restores tops and seats.

Blue Ribbon Hand-On Patch
A self-vulcanizing patch for shoes and tubes that never fails.

Blue Ribbon Cream Metal Polish
For any metal. An easy, quick working, satisfactory polish.

Blue Ribbon Oil Soap
A pure vegetable oil soap for any purpose. All quality and efficient.

This is the time to consider your winter and spring requirements

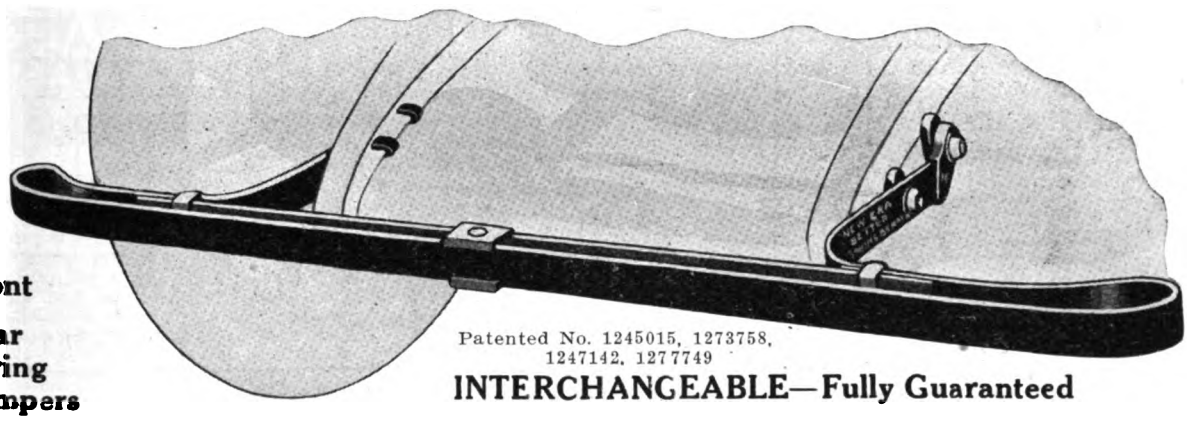
NEW ERA
"Better" Spring Bumpers
FOR ALL MAKES OF CARS



Front and Rear Spring Bumpers

Patented No. 1245015, 1273758, 1247142, 1277749

INTERCHANGEABLE—Fully Guaranteed

STRONGER — LIGHTER — NEATER

Unusual Resiliency

The New Era "Better" Spring Bumper is constructed of tempered spring steel bars, one inch apart, which are tied in center with three-inch plate, assuring an unusual strength and resiliency. A bumper is as strong as its weakest point, and there are no weak points in the New Era Bumper.

Absorbs Shocks

No matter from which angle the New Era "Better" Spring Bumper strikes, it absorbs and distributes the shock throughout its entire length and arms. It fully protects both occupants and car, and is the best automobile insurance obtainable.

No Dealers' Dead Stock

One big important feature is the free exchange of attaching arms for any more salable cars; so not a dollar's worth of dead bumper stock need be carried. A positive evolution and solution.

1920 Prices—Tax Absorbed

Standard Black	$11.55
Special Black	13.65
Ford—Front and Rear in Black	10.50
Rustproof Zinc Nickel, extra	2.10

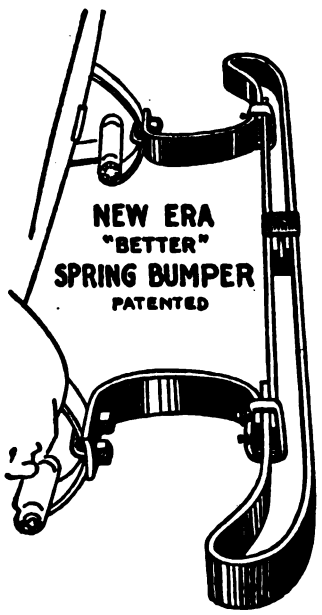
Ready and Profitable Dealer Sales

The public are sold on their knowledge of a spring bumper, it being the only practical and real shock absorber. There is an unusual opportunity for dealers to make liberal discount and quick stock turnover. No dead stock. Excellent factory co-operation. Get full details at once.

No Cutting or Drilling of Frames

Our Patented Universal Adjustable Hook on attachments are quickly attached to 95% of all makes of cars; on the fronts as well as on some rears. Hooks are attached to either top or bottom edge of frame, without interfering with splash pan.

Remarkable Resiliency



New Era Spring & Specialty Co.

1177 Hamilton Ave. **Grand Rapids, Mich.**

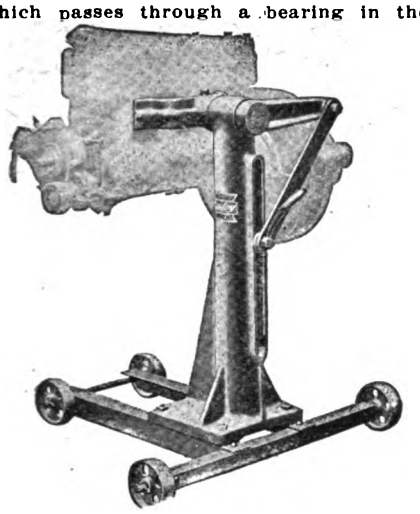
ACCESSORIES, EQUIPMENT AND TOOLS FOR THE GARAGE AND REPAIR SHOP

The New Manley Ford Engine Stand includes many new features not heretofore found in engine stands designed for the Ford engine, among them being the adjustable head, which not only takes the Ford engine as a unit, holding it securely by a single bolt fastening, freeing the water jackets from any strain, but is also easily adjustable, allowing the engine to be turned to any position desired. A heavy cast steel base, mounted on an angle iron frame, provided with small rolls, supports the head, at the same time providing an easy means for moving the stand from point to point in the service station. Adjustment of the head is made by an arm fastened to the center shaft, which passes through a bearing in the

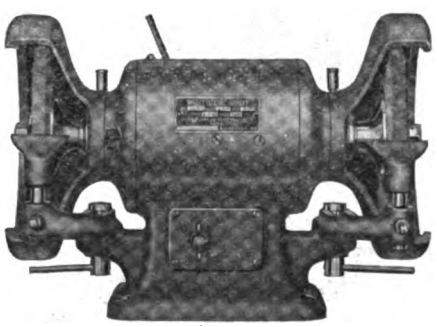


upright of the stand. At the end of this arm a flat steel brace is attached, fitting a bolt which travels in a slot cast in the side of the upright of the standard, and is fastened, after making the necessary adjustment, by a lever, having a treaded opening fitting the bolt.

It is stated that this device makes every part of the Ford engine easily accessible, as the engine is gripped in the center and turns over in a complete circle and may be instantly locked rigidly in any position.

Manufactured by the Manley Manufacturing Co., York, Pa. Price, No. 182 Portable Stand, $32; No. 181 Stationary Stand, $28.

Stow Bench Grinders Nos. 81 and 82 have the motors completely enclosed, with the starting and stopping devices located conveniently in the bases. The grinders may be placed in any convenient place about the service station where current is available. For a few dollars extra a floor stand can be added on which the equipment may be mounted, bringing the work at a standing height from the floor. They may be used as all around grinders for a variety of work, such as buffing, grinding, etc.; can be equipped with extended spindles for the buffers in place of one wheel if desired and may be provided



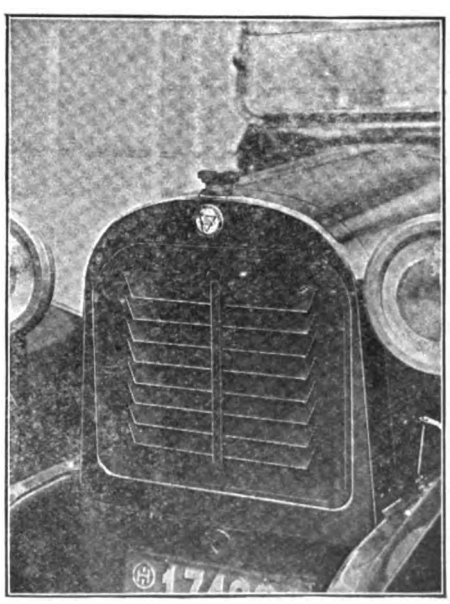
with flanges for clamping wheels to insure their running true, and with a water container of ample dimensions for cooling work while grinding. Hoods for the cutting members are the latest improvement added to these machines, which are provided with hinged doors on the outside.

The motors are wound for either 110 or 220-volt direct current and single two or three-phase alternating current, 60 cycle.

Manufactured by the Stow Manufacturing Co., Inc., Binghamton, N. Y. Prices on request.

The Doty Radiator Shutter is a recent invention that has all the ear-marks of a big success. The product is a new shutter for all makes of cars, is made of metal-bound fiber and is so constructed that it can be applied to any car in five minutes, it is stated.

The model for Ford cars is now being turned out in big production units. The company will immediately have several

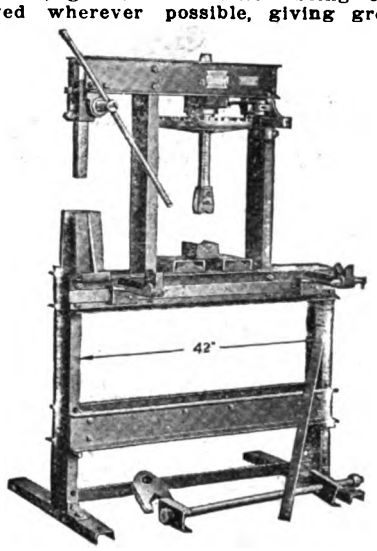


other models ready for the market, including the Dodge, Chevrolet, Oakland, 1920 Maxwell and new Overland Four cars.

A big feature in favor of the Doty shutter is its very simple construction and the fact that it is claimed to be absolutely free from rattles.

Manufactured by the Auto Radiator Shutter Co., Dayton, O. Price, retail, $8 each. Special proposition to jobbers and dealers.

The Manley 22-Ton 42-Inch Press is designed and developed especially for automobile repair work in service stations and garages. The frame is made throughout of steel, girder construction being employed wherever possible, giving great



strength. Besides the usual hand wheel, for holding the work in position, additional leverage is supplied by a hand lever and multiplied gearing, operating on the worm of the press and located in the top cross member. The result is a press having a high power ratchet leverage of 2200 to 5000 to one for heavy work. A high speed, high power sensitive leverage of 1000 to one for light work, especially adapted for straightening operations. The 42-inch opening is sufficiently large to easily accommodate a truck wheel with solid tire.

Manley presses may be purchased in larger sizes for heavier work if desired, having a leverage of 44 to one and exerting a pressure of from 3½ to five tons. Extra attachments that are included with the Manley press are two test centers for centering the work, which are indispensable where straightening is to be done, and two 60-degree centers, one fixed, the second adjustable. The Manley press is made throughout of the best of material, by men experienced in this class of machine work and knowing from long experience what the trade demands.

Manufactured by the Manley Manufacturing Co., York, Pa. Price, $30.
